Sometimes they enter into their holes in Autumn before Winter, and in the Spring time come out again. When with their croaking voyces the male provoketh the female to carnal copulation, which he performeth not by the mouth (as some have thought) but by covering her back : the inthrument of generation meeting in the hinder parts, and this they perform in the hight feafon, nature teaching them the modelty or shamefastnesse of this action: And besides in that time they have more fecurity to give themselves to mutual imbraces, because of a general quietnesse, for men and all other their adversaries are then at sleep and reft. After their copulation in the waters, there appeareth a thick jelly, out of which the young one is found, But the land Progs are ingendered out of Egsof whom we discourse at this present; and therefore they both suffer copulation, lay their Egges and bring forthlyoung ones on the land. When the Egge breaketh or is hatched, there cometh forth a little black thing like a piece of flesh, which the Latines call Gyrini, from the Greek word Gytimes, having no visible part of a living creature upon them, besides their eyes and their tails, and within thort space after their feet are formed, and their tail divided into two parts, which tail becometh their hinder-legs: wherefore when the Egyptians would describe a man that cannot move himself, and afterwards recovereth his motion, they decipher him by a Frog, having his hinder-lege, The heads of these young Gyrini, which we call in English Horse-nails; because they resemble a Horsenail in their similitude, whose head is great, and the other part small, for with his tail he swimmeth. After May they grow to have feet, and if before that time they be taken out of the water, they die, when they begin to have four feet.

And first of all they are of a black colour and round, and hereof came the Proverb, Rana Gyrina feinnia, wifer then a Horse-nail; because through the roundnesse and volubility of his body, it turneshit self with wonderful celerity, which way soever it pleaseth. These young ones are also except Ranunculus, on Rana nassens. And it is to be remembred, that one Frog layeth an incommerable company of Egges, which cleave rogether in the water, in the middle whereof she her self lodgeth. And thus much may suffice for the ordinary procreation of Frogs by generation out of Egges. In the next place I must also shew how they are likewise ingendered out of the diff of the earth by warm, aftive, and Summer showers, whose life is short, and there is no use of them.

Elianus faith, that as he travailed out of Italy into Naples, he saw divers Frogs by the way near sund, whose fore-part and head did move and creep, but their hinder-part was unformed and like to the slime of she sarth, which easied Ovid to write thus;

Contacting No.

Altera pars vivit, runs viring.

That is to say:

Durt bath his seed ingendring Frogs full green;

Yet so as seedlesse without legs on earth they lie;

So as a wonder unte passengers in seen, which is the other earth full dead is the color of the other earth full dead is the color.

And of these Frogs it is that Plany was to be understood, when he saith, that Frogs in the Winter time are resolved into slime, and in the Summer they recover their life and substance again. It is certain also, that sometime it raineth Frogs, as may appear by Philarchua and Lembus; for Lembus writen thus: Once about Dardania, and Recover, it rained Progs in such plentistic measure; or rather prodigious manner, that all the houses and high ways were filled with them, and the Inhabitants did first of all kill them, but afterwards perceiving no benefit thereby, they shur their doores against them, and stopped up all their lights to exclude them out of their houses, leaving no passage open, so much as a Prog might creep into, and yet notwithstanding all this diligence, their meat seething on the fire or set on the table, could not be free from them, but continually they sound Progs snit; so as at last they were inforced to so sake that Countrey. It was likewise reported; that certain Indians and people of Arabia, were inforced to forsake their Countries through the multitude of Progs.

Cardan feemeth to finde a reason in nature for this raining of Frogs, the which for the better latis-faction of the Reader, I will here expresse as followesh: Fiunt becomming ventorum ira, and so forward in his 16. Book De Subtilitate, that is to say; these prodigious rains of Frogs and Mice, little sistes and stones, and such like things is not to be wondered at: for it cometh to passe by the rage of the windes in the tops of the Mountains, or the uppermost part of the Seas, which many times taketh up the dust of the earth and congealest them into stones in the air; which afterwards fall down in rain; so also doth it taketyp Frogs and Fishes, who being above in the air, must needs sall down again. Sometimes also it taketh up the egges of Frogs and Fishes, which being kept alost in the air among the whirl-windes, and storms of shewers, do there engender and bring forth young ones, which afterwards sall down upon the earth, there being no pool for them in the air. These and such like reasons are approved among the learned for natural causes of the prodigious raining of secons.

But we read in holy Scripture among the plagues of Egypt, that Frogs were fent by Godto annoy them; and therefore what soever is the material cause, it is most certain that the wrath of God and his Almighty hand, is the making or efficient cause, and for the worthinesse of that divine story, how God maketh and taketh away Frogs, I will expresse it as it is left by the holy Ghost, inch. 8. Exod. ver. 5. Alfo the Lord faid unto Moses, say thou unto Aaron, stretch thou out thy hand with thy red upon the streams, upon the rivers, and upon the ponds, and cause Frogs to come upon the land of Egypt. Vet. 6. Then Aaron Stretched out his hand upon the waters of Egypt, and the Frogs came up and covered the land of Egypt. Vers. 7. And the Sorcerers did likewise with their Sorceries, and brought Frogs upon the land of Egypt. Vers. 8. Then Pharaoh called for Moses and Aaron, and said; Pray ye unto the Lord, that he may take away the Frogs from me, and from my people, and I will let the people go, that they may do factifiet to the Lord. Vers. 9. And Moses said unto Pharaoh, concerning me, Command when I shall pray for the and thy fevents, and thy people, to destroy the Frogs from thee, and from thy houses, that they may remain in the River only. Verl. 10. Then he faid to morrow, and he answered, Be it as thou hast faid, that thou mays know that there is none like the Lord our God. Vers. 11. So the Frogs shall depart from thee, and from thy bouses, and from thy people, and from thy fervants, only they shall remain in the River. Ver. 12. Then Moles and Aaron went out from Pharaoh, and Moses cryed unto the Lord concerning the Frogs which he had sent unto Pharaoh. Verl. 13. And the Lord did according to the saying of Moses, so the Frogs dyed in the houses, and in the Towns, and in the fields. Vers. 14. And they gathered them together by heaps, and the land flank of them, &c.

And this was the second plague of Egypt, wherein the Lord turned all the Fishes into Frogs: as the Book of Wisdom saith, and the Frogs abounded in the Kings chamber: and notwithstanding this great judgement of God for the present, Pharach would not let the people go, and asterwards that blinde superstitious Nation became worshippers of Frogs, (as Philastrius writeth) thinking by this devotion, or rather wickednesses in this observant manner, to pacifie the wrath of God, choosing their own ways before the word of Almighty God: But vain is that worship which is invented without heavenly warrant, and better it is to be obedient to the will of God, then go about to please him with the cogitations of men, although in their pretended holinesse we spend much time, wealth, and bloud.

There was one Cypfelw, the father of Periander, who by his mother was hid in a Cheft called Kylle, to be preserved from the hands of certain murtherers, which were sent to kill him. Wherefore afterwards the said Cypfelw consecrated a house at Delphos to Apollo, because he heard his crying when he was hid in a chest, and preserved him. In the bottom of that house, was the trunk of a Palm-tree and certain Frogs pictured running out of the same: but what was meant thereby is not certain known, for neither Plutateb which written the story, nor Chersias which relateth it, giveth any signification

nification thereof: but in another place where he enquireth the reason why the Oracle of Pythine gave no answer, he conjectured because it was that the accursed thing brought out of the Temple of Apollo from Delphos, into the Gorinthian house, had ingraven underneath the Brazen Palm, Snakes, and Frogs, or else for the fignification of the Sun rising.

The meat of Frogs thus brought forth are green herbs and Humble-bees, or Shorn-bugs, which

The meat of Progs thus brought to the water to drink; sometime also they are said to eat earth, they devour or catch when they come to the water to drink; sometime also they are said to eat earth, but as well Frogs as Toads do eat the dead Mole, for the Mole devoureth them being alive. In Albertus. the moneth of August, they never open their mouths, either to take in meat or drink, or to utter any voyce, and their chaps are so saft joyned or closed together, that you can hardly open them with your singer, or with a stick. The young ones of this kinde are killed by casting Long-wort, or the leaves of Sea-lettice, as Elianus and Suidas write: and thus much for the description of their parts, generation, and suitentation of these common Frogs.

The wildom or disposition of the Ægyptian Frogs is much commended, for they save themselves from their enemies with singular dexterity. If they fall at any time upon a Water-snake, which they know is their mortal enemy, they take in their mouths a round Reed, which with an invincible strength they hold sast, never letting go, although the Snake have gotten her into her mouth, for by this means the Snake cannot swallow her, and so she is preserved alive.

There is a pretty fable of a great Bull which came to the water to quench his thirst, and whilest the Beast came running greedily into the water, he trod in pieces two or three young Frogs; then one of them which escaped with life, went and told his mother the miserable missfortune and chance of his fellows: she asked who it was that had so killed her young ones, to whom he answered: It was a great one, but how great he could not tell; the foolish Mother-frog desirous to have seen so mody in the eyes of her son, began to swell with holding in of her breath, and then asked the young one if the Beast were as big as she? And he answered much greater, at which words she began to swell more, and asked him again if the Beast were so big? To whom the young one answered, Mother leave your (welling, for though you break your self, you will never be so big as he: and I think from this table came the Proverb, Rana Gyrina Japientior, wiser then the young Frog. This is excellently described by Horace in his third Satyre, as followeth:

Absentis tanz pullis vituli pede presss Unus ubi essignt matri dendrrat, ut ingens Bellua cognates elisetti, illä togare, Quantistel Num tandem, se instant sic magna suisset? Major dimidio: Num tanto ? Cum magie atys; Se magie inflaret, non si te ruperio, inquit, Par erio: bac à te non multum abludit imagio.

Which may be Englished thus;
In old Frogs absence, the young were press to death
By seet of a great Calf, drinking in the water,
To tell the dam, one ran that scap't with life and breath,
How a great heast her young to death did scatter.
How great said she? so big? and then did swell.
Greater by half, said be: then she swoll more, and said
Thus big? but he: cease welling dam, for I thee tell,
Though break thy self, like him thou never canst be made.

There is another pretty fable in Esop, tasking discontented persons under the name of Frogs, according to the old verse:

Et veterem in limo rana cocinere querelam,

Nam neque sicca placet, nec qua stagnata paludo
Petpetitur, querula semper convitia rana.

Which may be Englished in this manner;

The Frogs amidst the earthly slime,
Their old complaints do daily sing:
Not pleas'd with pools, nor land that drine,
But new displeasures daily bring.

When Ceres went about feeking Proferpina, the came to a certain Fountain in Lyoia to quench her thirst, the uncivil Lycians hindered her from drinking, both by troubling the water with their feet, and allo by fending into the water a great company of croaking Frogs; whereat the Goddesse beaing angry, turned all those Countrey people into Frogs. But Ovid doth ascribe this transmutation of the Lycians, to the prayer of Latona, when the came to drink of the Fountain to increase the milk in her breass, at such a time as the nursed Apollo and Diana, which Metamorphosis or transmutation, is thus excellently described by Ovid;

Eternum stagno (dixit) vivatis in isto. Evenium optata dea, juvat esse sub undie, Et modo sna ceva summetgere membra paludo, Nunc proserre caput, summo modo gurgrie nare,

Sape super ripam stagni consistere, sape la gelidos residre lados, sed nunc quoque surpes Litibus exercent linguas, pulsoque pudore Quambio sint sub aque, sub aque male dicere tentant. Qq q 11 30 100

55570 15.4

groot mountable to a se

Led offered to all

Von queque jam rauce eft inflataq; colla tumefcunt: Iplaque dilatant patulos convitia ridue. Terge caput tangunt colla intercepta videntur. In English chus;

Spina viret venter pars maxima corporis albet. Limo fog: nova [alium, in surgite rana.

For ever mought you dwell In this fame pond fbe faid : ber wift did take effet with feed. For underneath the water they delight to be indeed : Now dive they to the bottom down, now up their heads they pop, Another while with fprawling legs they frim upon the top. And oftentimes upon the banks they have a minde to ffond. And oftentimes from thence again to leap into the pond : And therethey now do practife fill their filthy tongues to foold, And Spamelefly, though underneath the water they do hold Their former went of brauling, still avoid the water cold: Their voyces still are boarse and harsh, their throats have puffed goawls, Their chaps with brawling widened are, their hammer headed joawles Are joyned to their shoulders just, the necks of them do feem Cut off: the ridge bone of their back sticks up with colour green. Their panch which is the greatest part of all their trunck is gray. And fo they up and down the pond made newly Frogs do play.

Whatfoever the wifdom of Frogs is, according to the understanding of the Poets, this is certain that they fignifie impudent and contentious persons, for this cause there is a pretty fiction in Hell betwixt the two Poets, Euripides and Aefebylus : for the ending of which controversie, Bachus was fent down to take the worthyest of them out of Hell into Heaven : and as he went over Chargen Ferry. he heard nothing but the croaking of Frogs, for fuch contentious spirits do best besit Hell. And thus much shall suffice to have spoken of the wisedom of Frogs.

Their common enemies are the Weafels, Poul-cats, and Ferrets, for thefe do gather them together, and lay of them great heaps within their dens : whereupon they feed in Winter. The Hearn also and Bittern, is a common destroyer of Frogs, and so likewise are some kinde of Kite. The Night-birds, Gimus and Gimeta, the Water-fnake (at whose presence in token of extream terror) the Frog setteth up her voyce in lamentable manner. The Moles are also enemies to Frogs, anditis further faid; that if a burning Candle be fet by the water fide, during the croaking of Frogs, it will make them hold their peace. Men do also take Frogs, for they were wont to bait a hook with a little red wooll, or a piece of red cloth, also the gall of a Goat put into a vellel, and let in the earth, will quickly draw unto it all the Frogs that be near it, as if it were unto them a very grateful thing: And thus much shall suffice to have spoken of the enemies of Frogs. Now in the next place we are to confider the several uses, both Natural, Medicinal, and Magical, which mendo make of Frogs.

And first of all the green Frogs, and some of the yellow which live in Flouds, Rivers, Lakes, and Fish-pools, are eaten by men; although in ancient time they were not eaten, but only for Physick, for the broth wherein they were fod, and the flesh also, was thought to have vertue in it to cure them which were strucken by any venomous creeping Beast, especially mixed with Salt and Oyl: but fince that time Actim discommendeth the eating of Frogs, proving that some of them are renomous, and that by eating thereof, extream vomits have followed, and they can never be good, except when they are newly taken, and their skins diligently flayed off, and those also out of pure running waters and not out of muddy stinking puddles : and therefore adviseth to forbear in plenty of other meat, this wanton eating of Frogs, as things perilous to life and health, and those Frogs allo which are most white when the skin is taken off, are most dangerous and fullest of venom, according to the counsel of Fiera, saying;

> Ultima, sed nostros non accessura lebetes, Noluimus, succi est pluvit & limosa maligni. Ni faliat, putris rana paraba titer. Irata est & adbuc rauca coaxat aquis.

In English thus: We will not dreffe a Frog unleffe the last of all to eat, Because the juyce thereof is muddy and of rain unclean, Except it go on earth, prepared way to leap.

For, argy it ever is, and bath hoarse voyce amid the stream.

They which use to eat Frogs, fall to have a colour like lead, and the hotter the Counties are, the more venomous are the Frogs; in colder Countries, as in Germany they are not to harming, especially after the Spring of the year, and their time of copulation passed. Besides, with the school Frogs, they were wont in ancient time to bait their hooks, wherewithal they did take purple Files, and they did burn the young Frogs, putting the powder thereof into a Cat, whole bowels within out, then rofting the Cat, and after the was roafted, they anointed her all over with Honey, the laid her by a Wood fide, by the odour and favour whereof, all the Wolfs and Foxes lodging in the faid Wood were allured to come to it, and then the Hunters lying ready in wait, did take, destroy and kill them. When Frogs do croak above their usual custom, either more often, or more shrill then they were wont to do: they do foreshew rain and tempestuous weather.

Wherefore Tully faith in his first Book of Divination, who is it that can suspect, or once think that the little Prog should know thus much, but there is in them an admirable understanding nature. constant and open to it self, but more secret and obscure to the knowledge of men; and therefore

fpeaking to the Frogs, he citeth thefe verfes;

Vos quoge signa videtis aquai dulcis alumna Cum clamore paratis inanes fundere voces, Absurdog: fono fontes & ftagna cietis.

In English thus : And you O Water-birds which dwell in fireams fo freet, Do fee the signes whereby the weather is foretold.

Tour crying voyces wherewith the waters are repleat Vain lounds, absurdly moving ools and Fountains cold.

And thus much for the natural use of Frogs. Now followeth the Magical, It is faid that if a man Albertus. rake the tongue of a Water-frog, and lay it upon the head of one that is affeep, he shall speak in his Riranides. fleen and reveal the secrets of his heart : but if he will know the secrets of a woman, then must he Democrities cut it out of the Frog alive, and turn the Frog away again, making certain characters upon the Frogs tongue, and so lay the same upon the panting of a womans heart, and let him ask her what questions he will, the shall answer unto him all the truth, and reveal all the secret faults that ever the hath committed. Now if this magical foolery were true, we had more need of Frogsthen of Inflices of Peace, or Magistrates in the Common-wealth.

But to proceed a little further, and to detect the vanity of these men, they also say, that the staffe wherewithal a Frog is struck out of a Snakes mouth, laid upon a woman in travail, shall cause an eafie deliverance: and if a Man cut off a foot of a Frog as he swims in the water, and binde the same to one that hath the Gout, it will cure him. And this is as true as a shoulder of Mutton worn in ones

Hat healeth the Tooth-ach.

Some again do write, that if a woman take a Frog, and spit three times in her mouth, the shall not conceive with childe that year. Also if Dogs eat the pottage wherein a Frog hath been sod, it maketh him dum and cannot bark. And if a Man calt a fod Frog at a Dog, which is ready to affault him, it will make him run away, (I think as fast as an old hungry Horie from a bottle of Hay.)
These and such like vanities have the ancient Heathens (ignorant of GOD) firmly believed, till either experience disapproved their inventions, or the fincere knowledge of Religion inlightning their darknesse, made them to forsake their former vain errors, which I would to GOD had come fooner unto them, that fo they might never have finned; or elle being now come unto us their children, I pray GOD that it may never be removed, left by trufting in lying vanities, we for lake our own mercy. And so an end of the Magical Uses. Now we proceed to the Medicinal, in the biting of every venomous creature. Frogs fod or roasted, are profitable, especially the broth, if it be given to the fick person without his knowledge, mixed with Oyl and Salt, as we have faid already. The flesh of Water frogs is good against the biting of the Sea-hare, the Scorpion, and all kinde of Serpents; against Leprosie and scabs, and rubbed upon the body, it doth cure the fame.

The broath taken into the body with roots of Sea, holm, expelleth the Salamander: fo also the figges of the Frog, and the Egges of the Tortoile, hath the same operation, being sod with Calaminth. The little Frogs are an antidote against the Toads and great Frogs. Albertus also among other remedies, prescribeth a Frog to be given to sick Faulkons or Hawks; It is also good for tricks in the neck, or the Cramp. The same sod with Oyl, easeth the pains and hardnesse of the joynte and finews: they are likewise given against an old Cough, and with old Wine and sod Corn drunk out of the Vessel wherein they are sod, they are profitable against the Dropsie, but with the sharpest Vinegar, Dyl, and foume of Niter fod together, by rubbing and anointing, cureth all scape in Horses, and pestilent tumors.

There is an Oyl likewise made out of Frogs, which is made in this manner; they take a pound of Frogs, and put them into a vellel or glasse, and upon them they pour a pinte of Oyl, so stopping the mouth of the glasse, they seethe it as they do the Oyl of Serpents, with this they sure the firinking of the finews, and the hot Gout, they provoke fleep, and heal the inflammations in Fevers, by anointing the Temples. The effect of this Qyl is thus described by Serenu :

> Sepe ita per vadit vis frigoris, as tenet arens. VI vix quasito medicamine pulsa recedat. Si ranam en eleo deconeris, abjice carnem, Membra fove, manie

That is to lay;
Often are the sinews held by force invading cold,
Which scarse can be repelled back by medicines tried might,
Then sethe a Frog in purest Oyl, as Ancients wibave told,
So bathe the members sick therein. Frogs stell cast out if sight.

And again manother place he speaking of the cure of the Fever, writeth thus,

Sed prim oft oleo partm fervescere Rane, In trivin, illeque artm perduerre succe. In English thus; But first let Oyl make bot young Frogs new sound In ways, therewith bring sinews weak to weal full school.

To conclude, it were infinite and needlesse to expresse all that the Physitians have observed about the Medicines rising out of the bloud, fat, sless, heart, liver, gall, intraits, legs, and speim of Frogs, besides powders, and distillations; therefore I will not weary the Reader, nor give occasion to ignorant men, to be more bold upon my writing of Physick then is reason, lest that the fail against me which proverbially is said of unnecessary things, Rana vinum ministra, you give Wine to Frogs, which have neither need nor nature to drink it, for they delight more in water. And so I conclude the History of this vulgar Frog.

of the GREEN FROC.

This Frog is called Calamites, and Dryophytes, and Mantis, and Rana virent. In Atalia hyberkov, and Cucumoines, and Cucumones, Irici, Ranule, Brexantes, of Brewlein, to rain, and thereof consects the faigned word of Ariflophanes, Brekekekex Koax, but I think that as our English word Frogs derived from the German word Frosh, so the Germani Frosh from the Greek word Brex, it is called also Zamia, that is, Dammans losse, hut or damage, because they sive in trees, and many times harm Men and Cattle underneath the trees; and therefore called Zamia, of the Greek word Zamia. The Men and Cattle underneath the trees; and therefore called Zamia, of the Greek word Zamia. The Italians call it Raoula, Ranocchia, Lo Ronovote, Rahonchia derubetto. The French, Crossett, and some times Graisset, Verdier; in Savoy, Renogle. In Germany, Loubfrosh. In Poland, Zaba Tranna. Some of the Latines for difference sake call it Rana Rubeta, because it liveth in trees and bushes; and forthe same cause it is called Galamites, because it liveth among reeds, and Dryopetes, because it saled Galamites, because it liveth among reeds, and Dryopetes, because it saled Calamites, because it liveth among reeds, and Dryopetes, because it saled was a sale of the case.

It is the least of all other Frogs, and liveth in frees, or among fruits and trees, especially in the Woods of Hasels, or Vines, for with its short legs it climbeth the highest trees infomuch that some have thought it had wings. It is green all over the body, except the feet and the fingers, which are of dusty or reddish colour, and the tops of his nails or claws are blunt and round: In the diffection thereof there was blond found in every part of the body, and yet but little. The heart of it is white, the liver black, mixed with the gall. It hath also a milt, and in the end of July it least begges.

T':

It is a venomous Beast, for sometimes Cattle as they broule upon trees, do swallow down one of these upon the seaves not discerning it, because it is of the same colour? but presently steer they have eaten it their Bellies begin to swell, which must needs proceed from the possoned

A fecond reason proving it to be venomous, is for that many Authors do affirm, that hered is made the Psilothrum, for the drawing out of teeth by the roots, and for this cause is concluded to be venomous, because this cannot be performed without strong poyson. But for the cure of the poyson of this Frog, we shall expresse it afterward in the history of the Toad, and therefore the Reader must not expect it in this place. Always before rain they climbe up upon the types and there cry after a hoarse manner very much, which caused the Poet Serious to call it Ranogastila question other times it is mute, and hath no voyce: wherefore it is more truly called Mantis, that is, a Prophet or a Diviner, then any other kinde of Frog, because other Frogs which are not already mute, do cry both for sear, and also for desire of carnal copulation, but this never cryctic but be

Some have been of opinion, that this is a dum Frog; and therefore Vincentia Bellucanfit faith, that it is called a mute Frog from the effect: for there is an opinion, that this put into the mouth for Dog, maketh him dum, which if it be true; it is an argument of the extreme poylon thereincontained, overcoming the nature of the Dog, whose chiefest senses his taste and his smelling. And thus much shall suffice for the description of this Frog.

an Of the Fregulation

The medicinal vertues observed herein are these that follow. First if a man which hath a cough, do spet into the mouth of this Frog, it is thought that it doth deliver him from his cough, and being bound in a Crange skin unto a mans thigh, procureth venereous desires: but these are but magical devices, and such as have no apparent reason in nature, wherefore I will omit them, and proceed to them that are more reasonable and natural. First, for the Oyl of Frogs, that is the best which is made out of the green Frogs, as it is observed by Silvius; and if they are held betwixt a mans hands, in the sit of hot burning Ague, do much restess have white bellies, then cut off their heads and pull out their bowels, afterwards they seethe them in water, until the sless then cut off their heads and pull out their bowels, afterwards they seethe them in water, until the sless that shows, then they minglethe said flesh with Barley meal, made into paste, wherewithal they cram and feed Pullen with that paste, upon which the sick man must be fed, and in default of Frogs they do the like with Eels, and other like Fishes. But there is no part of the Frog so medicinable as is the bloud, called also the matter or the juyce, and the humor of the Frog, although some of them write, that there is no bloud but in the eyes of a Frog: First therefore with this they kill hair, for upon the place where the hair was puld off, they pour this bloud, and then it never groweth more: And this as I have said already, is an argument of the venom of this Frog; and it hath been proved by experience, that a man holding one of these Frogs in his hands, his hands have begun to swell, and to break out into blisters. Of this vertue Serenw the Poet writech thus;

Praterea quascunque voles avertere setas,
Asque in perpetuum rediviva occludere tela,
Corporibus vulsis saniem perducito rana,
Sed qua parva situ est, & rauco, garrula questu.
That is to say;
Besides, from whatsever bodies hairs thou will
Be clean destroyed, and never grow again
On them, the mattery blond of Frogs, all spread and soil,
I mean the little Frog questing boarse veyce amain.

The same also being made into a Verdigrease, and drunk the weight of a Grown, stoppeth the continual running of the urine. The humor which cometh out of the Frog, being alive when the skinis straped off from her back, cleareth the eyes by an Ointment, and the flesh laid upon them, easth their pains; the shesh and far pulleth out teeth. The powder made of this Frog being drunk, sayeth bleeding, and also expelleth spots of bloud dryed in the body. The same being mingled with Pitch, cureth the falling off of the hair. And thus much shall suffice for the demonstration of the nature of this little green Frog.

Of the Padock or Crooked back FROG.

It is apparent that there be three kindes of Frogs of the earth, the first is the little green Frog: the fecond is this Padock, having a crook back, called in Latine, Rubeta Gibbofa; and the third is the Toad, commonly called Rubetax, Bufo. This fecond kinde is mute and dumb, as there be many kinde of mute Frogs, such as is that which the Germans call Fourkyots, and our late Alchymists Puriphrunen, that is, a Firefrog, because it is of the colour

of fire: This is found deep in the earth, in the midft of Rocks and stones when they are cleft asunder, and amongst metals, whereinto there is no hole or passage, and therefore the wit of man cannot devise how it should enter therein, only there they finde them when they cleave those stones in sinder with their wedges and other instruments. Such as these are, are found near Tours in France, among a red sandy stone, whereof they meak the Milstones, and therefore they break that stone all in pixes before they make the Milstone up, lest while the Padock is included in the middle, and the Milstone going in the mill, the hear should make the Padock swell, and so the Milstone breaking, the commodal be poyloned. Alson as these Padocks come once into the air, out of their close places of generation and habitation, they swell and so die.

This crook-backed Padock is called by the Germans, Gertenfrofob, that is, a Frog of the Garden, and Graffolo, that is, a Frog of the graffe. It is not altogether mute, for in time of peril, when they are thated by men. or by Snakes, they have a crying voyee, which I have oftentimes proved by experience, and all Snakes and Sepants do very much hunt and defire to deftroy these; also I have feen a

2943

Snake

Snake hold one of them by the leg, for because it was great the could not easily devour it and during

that time it made a pitiful lamentation.

at time it made a pictor interest two little horns or bunches in the middle of the back and the I neter radocus nave us to wetches, on the fides they have red ippres, and the feet are of the fame colour, their belly is white; and that part of their back which is directly over their break, is diffine colour, their perly is white, a few black foots. And thus much may ferve for the particular description of the particular description descriptio dock, not differing in any other thing that I can read of from the former Frogs, it being vedock, not untering in any tree or the cure is to be expected hereafter, in the next Hillory of the Toad.

of the TOAD.

TO conclude the story of Frogs, we are now to make description and narration of the Toad, which is the most noble kinde of Frog, most venomous and remarkable for courage and strength. This is called in Hebrew by fome Coah; the Grecians call it Phrunon; the Arabians, Myfoxus; the Germans, Krott: the Sax. ons, Quap; the Flemings, Padde; the Illyrians, Zaba; the French, Crapault; the Italians, Rofpo, Botta, Boffa, Chiatto , Zatto, Buffo, Buffa, Buffone, and Ramarro; the Spaniard, Sapo efcu, erco, the Latines, Rubeia, because it liverhamong bushes, and Bufo , because it swelleth when it is angry.

Now I finde of these Toads two kindes, the one called Rubeta paluftris, a Toad of the fens, or of the waters; the other Rubeta terrestris, a Toad of the earth; And these in Authors are fometimes confounded, one taken for another. The greatest difference that I can learn, is their feat or place of habitation, for they live both of them in the land and in the water. And of them that be in the water, fome of them be smaller then the other, and are therefore called Rube. tule, that is, little Toads: and I think they be the same which are called by some Authors Rane Simoides. Near unto Zurick, there are Toads not half fo big as the vulgar Toads, ar a place called Kiburg, being of a durty colour on the back, and there boned, the belly white and yellow, or rather betwixt both, the eyes of a gold flaming colour, the buttocks and hinder-legs hairy, and belides that place, these kindes of Toads are no where found. They have a very shrill voyce, so as they are heard a great way off, like a small bell or trumpet, and they never utter their voyce but in the Spring, and the fore-part of the Summer; for about September they hide themselves in trees, neither do they live among the waters, but on the dry land; when they cry, it is certain that the night following will bring forth no frost.

Like unto this there is a Toad in France called Bufo cornuins, a horned Toad, not because it hath horns, for that is most apparently false, but for that the voyce thereof is like to the found of a Cornet, or rather (as I think) like to a Raven called Cornix, and by a kinde of Barbariim called Bufo cornutm. The colour of this Toad is like Saffron on the one part, and like filthy dist on the other: besides, there are other venomous Toads living in finks, privies, and under the room of

There is another kind alfo, like to the Toad of the water, but in stead of bones it hath only grilles and it is bigger then the Toad of the fen, living in hot places. There is another alfo, when although it be a Toad of the water, yet hath it been eaten for meat not many years fince sepemouth of it is very great, but yet without teeth, which he doth many times put out of the water live a Tortoile to take breath, and in taking of his meat, which are flies Locusts, Caterpillers, Gnats and small comping things, it imitateth the Chamæleon, for it putteth out the tongue, and licketh in his meat by the foace of three fingers, in the top whereof there is a foft place, having in it viscous humor, which caufeth all things to cleave fast unto it which it toucheth, by verzue whereof it devoureth great flies. And therefore the faid tongue is faid to have two little bones growing at the root thereof, which by the wonderful work of Nature, doth guide, fortifie and frengthen it. And thus much may free is a sufficient relation unto the Reader for the diversity of Toads.

Now we will proceed to the common description of both kindes together. This Toadis in all outward parts like unto a Frog, the fore-feet being flort, and the hinder-feet long, but the body more heavy and swelling; the colour of a blackish colour, the skin rough, viscous, and very bard so atit it not easie to be broken with the blow of a staffe. It hath many deformed pots upon its effectally black on the fides, the belly exceeding all other parts of the body, flanding out in fuch manner, that being forther mith. ing smitten with a Raffe, it yeeldeth a sound as it were from a vault or hollow place. The heads broad and thick, and the colour thereof on the neather part about the neck is white, that is, fone what pale, the back plain without bunches, and it is faid, that there is a little bone growing inthe fides, that hath a vertue to drive away Dogs from him that beareth it about him, and is therefore called Apolynan. The whole afpect of this Toad is ugly and unpleafant. Some Authors affirm that it carryeth the heart in the meck, and therefore it carryeth the heart in the meck, and therefore it cannot early be killed, except the throat therefor it carryen the most the middle. Their liver is very victions, and causeth the whole body to be of ill temperament: And some say they have two livers. Their milt is very small; and as as for their copulation and egges, they differ nothing from Progs.

there be many late Writers, which do affirm that there is a precious flone in the head of a Toad. whole opinions (because they attribute much to the vettue of this stone) it is good to examine in this place; that so the Reader may be satisfied whether to hold it as a fable or as a true matter, exemplifying the powerful working of Almighty God in nature, for there be many that wear these stones plifying the powerful warming the state of t out of the head alive, before the Toad be dead, with a piece of cloth of the colour of red Scarler, wherewithal they are much delighted, fo that while they firetch out themselves as it were in sport upon that cloth, they cast out the stone of their head, but instantly they sup it up again, unlesse it betaken from them through some secret hole in the said cloth, whereby it falleth into a ciftern or ressel of water, into the which the Toad dareth not enter, by reason of the coldnesse of the water. Thefe things writeth Maffariu.

Brofavolus faith, that he found fuch a thing in the head of a Toad, but he rather took it to be a bone then a stone, the colour whereof was brown, inclining to blacknesse. Some say it is double. bone then a trone, the vocal waste waste was town, he think to be account to be a control of the there are divers opinions alfo, and they fay that Rones are ingendered in living creatures two manner of ways, either through heat or extream cold, as in the Shail, Pearch, Crab, Indian Tortoyles and Toads; fo that by extremity of cold this stone should be gotten.

Against this opinion the colour of the stone is objected, which is sometimes white, sometimes brown, or blackish, having a citrine or blew spot in the middle, sometimes all green, whereupon is naturally engraven the figure of a Toad, and this stone is formerimes called Beres, formetimes Cropsdine, and lometimes Nife, or Nufe, and Cholonites. Others do make two kindes of these two hones, one relembling a great deal of milk mixed with a little bloud, to that the white exceedeth the red, and yet both are apparent and visible : the other all black, wherein they lay is the picture of a Tord. with her legs spread before and behinde. And it is further affirmed, that if both these stones be held inones hand in the presence of poyson, it will burn him. The probation of this stone is by laying of it to a live Toad, and if the lift up her head against it, it is good, but if the run away from it, it is a

Gen. Agricola calleth the greater kinde of these stones, Browns, and the lesser and smoother fort of fiones, Ceraunie, although forthe contrary this opinion, faying that thefe flones Brantle, and Ceraunie, are bred on the earth by thundering and lightening. Whereas it is faid before, that the generation of this flone in the Toad proceedeth of cold, that is utterly unpossible, for it is described to be so folia and firm, as nothing can be more hard, and therefore I cannot affent unto that opinion, for unto hard and folid things, is required abundance of heat; and again, it is unlikely, that what foever this Toadflone be, that there should be any store of them in the world as are every where visible, if they were to be taken out of the Toads alive, and therefore I rather agree with Salveldenfis a Spaniard, who thinketh that it is begotten by a certain viscous fpume, breathed out upon the head of fome Toad, by her fellows in the Spring time.

This fione is that which in ancient time was called Bairophites, and they attribute unto it a vertue belides the former, namely, for the breaking of the stone in the Bladder, and against the Falling ficknesse. And they further write, that it is a discoverer of present poyson, for in the presence of poyson it will change the colour. And this is the substance of that which is written about this stone. Now for my part I dare not conclude either with ie, or against it, for Hermolans, Maffarins, Alberton, Sylvatie a, and others, are directly for this ftone ingendered in the brain or head of the Toad ; on the other fide, Cardan and Gefner confesse such a stone by name and nature, but they make doubt of the genemion of it, as others have delivered; and therefore they being in fundry opinions, the hearing whereof might confound the Reader, I will refer him for his fatisfaction unto a Toad, which he might cally every day kill : For although when the Foad is dead, the vertue thereof be loft, which confindinthe eye, or blew fpot inthe middle, perthe fubftance remaineth, and if the ftone be found there insubstance, then is the question at an end, but if it be not, then must the generation of it be sought

Thus leaving the stone of the Toad, we must proceed to the other parts of the story, and first of all their place of habitation, which for them of the water, is neer the water-fide, and for them of the earth, in bushes, hedges, rouks, and holes of the earth, never coming abroad while the Sun shirlethe for they hato the Sun-fhine, and their nature cannot endure it, for which cause they keep close in their holes in the day time, and in the night they come abroad. Yet fometimes in rainy weather and infolitary places, they come abroad in the day time. All the Writer time they live under the earth. inding upon earth, herbs, and worms, and it is faid, they ear earth by measure, for they ear to interently upon earth, herbs, and worms, and it is faid, they ear earth by measure, for they ear to interently day as they can gripe in their fore-footias it were fixing themselves, left the whole earth should
not serve themstill the Spring Resembling herein great rich coverous men, who ever spare to she of
for far they shall want before they die! And for this cause in suctent time the wife statistics of

Germany.

Germany, did picture a woman fitting upone Toad, to fignifie covetoufneffe. They also love to eat Germany, did picture a woman necros upon a true graph of the care sage; and yet the root of Sage is to them deadly poylon; They destroy Bees, without all danger to them lelves, for they will creep to the holes of their Hives, and there blow in upon the Bees, by which them lelves, for they will creep to the holes of their Hives, and there blow in upon the Bees, by which themselves, for they was treep to the Hive, and so destroy them as they come out a for this cause allost breath they draw them out of the Hive, and so destroy them as they come to drink in the destroy them. breath they answering out of the sairs, and they come to drink in the day time they feel lit. the water-nice they he in wash time they fee perfectly, and therefore they come then abroad, "I'tle or nothing, but in the night time they fee perfectly, and therefore they come then abroad, "I'

or nothing, out in the ingut time they worthy observations in natures sometimes they are bred. About their generation there are many worthy observations in natures sometimes they are bred About their generation there are many other arth; it hath also been febn that out of the ashes of out of the putres ction and corruption of the earth; it hath also been febn that out of the ashes of out of the putreis crion and corruption of the state of the year following. In the New Toad burnt, not only one, but many Toads have been regenerated the year following. In the New Toad burnt, not only one, but many Toads have been regenerated the year following. In the New Toads have been regenerated the year following. Toad burnt, not only one, but many a constant whereof is wonderful unwholesome, because all the world there is a Province called Dariene, the air whereof is wonderful unwholesome, because all the world there is a Province caned Daniele, it is there observed, that when the flaves or servine water Countrey standeth upon rotten marishes, It is there observed, that when the flaves or servine water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water which fall on the right hand are in a line water water which fall on the right hand are in a line water water water water water water water water water which fall on the right hand are in a line water w Countrey itandeen upon rotten indicates of water which fall on the right hand, are infantly many the pavements of the dores, from the drops of water which fall on the right hand, are infantly many the pavements of the drops of water are turned into Gnate. It has the pavements of the drops of water are turned into Gnate. Toads ingendered, as in other places such drops of water are turned into Gnats. It hath allo been Toads ingendered, as in other places dide, have likewise conceived at the same time a Frog, or a Toad, feen, that women conceiving with childe, have likewise conceived at the same time a Frog, or a Toad, or a Lizard, and therefore Platearim faith; that those things which are medicines to provoke the or a Lizara, and enoretore regression of the Secondines. And some have called Bufonemirations course of women, do also bring forth the Secondines. And some have called Bufonemiration Salernianorum, of lacertam fratteen Lombardorum: that is, a Toad the Brother of the Salemiran and the Lizard the Brother of the Lombards: for it hath been feen that a woman of Salernam, buth and the Lizard the Brother of the Lorad and therefore he calleth the Toad his Brother, io like at one time prought torth a Boy and a deference he calleth the Lizard the Lombard, Brother. And wife a woman of Lombard, a Lizard, and therefove he calleth the Lizard the Lombard, Brother. And wile a woman or Lomonray, & Libata, and the structures, at fuch time as their childe beginneth to quicken in their womb, do drink the juyce of Parsley and Leeks, to kill such conceptions if any be.

There was a woman newly marryed, and when in the opinion of all the was with childe, in fleed of a childe she brought forth four little living creatures like Frogs, & yet she remained in good health a connue me prougne rotte four feet fome pain about the rim of her belly, which afterward was eased by applying a few remedies. Alfo there was another woman, which together with a Man-childe, inher Secondines did bring forth fuch another Beaft; and after that a Merchants wife did the like in Anomitum. But what should be the reason of these so strange and unnatural conceptions, I will not take up. on me to decide in nature, lest the Omnipotent hand of God should be wronged, and his most lecret and just counsel presumptuously judged and called into question. This we know, that it was prophesied in the Revelation, that Frogs and Locusts should come out of the Whore of Babylon, and the bostomlesse pit, and therefore seeing the seat of the Whore of Babylon is in Italy, it may be that God would have manifested the depravation of Christian Religion, beginning among the Italian, and there continued in the conjoyned birth of Men and Serpents: for furely, none but Devilsimarnate, or men conceived of Serpents brood, would fo fiffely fland in Romifb error as the light do, and therefore they feem to be more addicted to the errors of their Pathers, (which they fay is the Religion wherein they were born) then unto the truth of Jesus Christ, which doth unanswerably detect the pride and vanity of the Romish faith.

But to leave speaking of the conception of Toads in Women, we will proceed further unto their generation in the stomachs and bellies of men, whereof there may more easily a reason be given then of the former. Now although that in the earth Toads are generated of the putrefied earth and waters, yet fuch a generation cannot be in the body of man, for although there be much patre faction in us, yet not fo much to ingender bones and other organes, fuch as are in Toads; as for Worms they are all fiesh, and may more easily be conceived of the putresaction in our flomachs. But then you will fay, how comes it to passe that in mens stomachs there are found Frogs and Toads? I answer that this evill hapneth unto such men as drink water, for by drinking of water, a Toads egge may eafily flip into the ftomach, and there being of a viscous nature, cleaveth fast to the rough parts of the ventricle, and it being of a contrary nature to man, can never be digeled or avoided, and for that cause the venom that is in it, never goeth out of the Eggeeither in operation or in substance, to poyson the other parts of the body, but there remaineth until the Egge be formed into a Toad, without doing further harm ; and from hence it cometh that Toads are bred in the bodies of men, where they may as well live without air, as they do in the midft of trees and rocks, and yet afterwards, these Toads do kill the bodies they are bred in. For the venomis forempered, that at last it worketh when it is come to ripenesse, even as we see it is almost an usual thing, to take a poylon, whose operation shall not be perceived, till many days, weeks, or moneths

For the casting out of such a Toad bred in the body, this medicine is prescribed; They take a Serpent and bowel him, then they cut off the head and the tail, the relidue of the body they likewife par into finall pieces, which they feethe in water, and take off the far which swimmeth at the top, which they feethe in water, and take off the far which swimmeth at the top, which the state of the far which swimmeth at the top. the fick person drinketh, until by vomiting he avoid all the Toads in his stomach, afterwark be must use restorative and aromatical medicines. And thus much may suffice for the ordinary and es-

These Toads do not leap as Frogs do, but because of their swelling bodies and short less, the traordinary generation of Toads. pace is a fost creeping pace, yet sometimes in anger they lift up themselves, enderousing to be harm, for great is their wrath, oblinacy, and defire to be revenged upon their advertises, entitle the red Tood. ally the red Toad; for look how much her colour inclineth to rednesse, so much is her with so venom more pestilent. If the take hold of any thing in her mouth, the will never let it so is the die, and many times the lendeth forth poylon out of her buttocks or backer, parts, wherewithal the intectech the air, for revenge of them that do anoy her: and it is well oblerved that the knowthe meaking fle of her teeth, and therefore for her defence the first of all gathereth abundance of ar into her body, wherewithal the gre-tly fwelleth, and then by fighing uttereth that infected air as neer the person that offendeth her as she can, and thus she worketh her revenge, killing by the povton of her breath. The colour of this poyfon is like milk, of which I will speak afterward particu-

A Toud is of a most cold temperament, and bad constitution of nature, and it useth one certain herb wherewithal it preserveth the sight, and also resistes the poyson of Spyders, whereof I have heard this credible History related, from the mouth of a true honourable man, and one of the most charitable Peers of England, namely, the good Earl of Bedford, and I was requested to set it down for

truth, for it may be justified by many now alive that saw the same.

it fortuned as the faid Earl travailed in Bedferdfbire, neer unto a Market-town called Owbourn, some A flory, of his company espyed a Toad fighting with a Spyder, under a hedge in a bottom, by the high-wayfide, whereat they flood still, until the Earl their Lord and Master came also to behold the same; and there he faw how the Spyder still kept her standing, and the Toad divers times went back from the Soyder, and did eat a piece of an herb, which to his judgement was like a Plantain. At the laft , the Earl having Jeen the Toad do it often, and still return to the combate against the Spyder, he commanded one of his mento go, and with his dagger to cut off that herb, which he performed and brought it away. Presently after the Toad returned to seek it, and not finding it according to her expectation, swelled and broke in pieces: for having received poyson from the Spyder in the combate. nature taught her the vertue of that herb, to expell and drive it out, but wanting the herb, the poyson did instantly work and destroy her. And this (as I am informed) was oftentimes related by the Earl of Bedford himself upon fundry occasions, and therefore I am the bolder to insert it into

I do the more easily believe it, because of another like story related by Erasmu in his Book of A story? Friendship, hapning likewise in Englandy in manner as followeth. There was a Monk who had in his chamber divers bundles of green rushes, wherewithal he used to strow his thamber at his pleasure, it hapned on a day after dinner, that he fell afleep upon one of those bundles of rushes, with his race upward, and while he there flept, a great Toad came and fate upon his lips, bestriding him in such manner as his whole mouth was covered. Now when his fellows fawit, they were at their wits end, for to pull away the Toad was an unavoidable death, but to suffer her to stand still upon his mouth, was a thing more cruel then death and therefore one of them espying a Spiders web in the window, wherein was a great Spyder, he did advise that the Monk should be carryed to that window, and laid with his face upward right underneath the Spyders web, which was prefently accomplished. And affoon as the Spyder faw her adversary the Toad, the presently wove her thred, and descended down upon the Toad, at the first meeting whereof the Spyder wounded the Toad, so that it swelled, and at the second meeting it swelled more; but at the third time the Spyder kild the Toad, and so became grateful to her Host which did nourish her in his Chamber; for at the third time the Toad leaped off from the mans mouth, and swelled to death; but the man was preserved whole and alive. And thus much may suffice for the antipathy of nature betwixt the Toad and the Spyder.

The Mole is also an enemy to the Toad, for as Albertus writeth, he himself saw a Toad crying above the earth very bitterly, for a Mole did hold her fast by the leg within the earth, labouring to pull her in again, while the other strove to get out of her teeth, and so on the other side, the Toads do eatthe Moles when they be dead. They are also at variance with the Lizard, and all kindes of Serpents, and whenfoever it receiveth any wound by them, it cureth it felf by eating of Plantain. The Cat doth alfo kill Serpents and Toads, but eateth them not, and unleffe the prefently drink the dyeth for it. The Buzard and the Hawk are destroyers of Toads, but the Stork never destroyeth a Toad to eatit, except in extremity of famine, whereby is gathered the venomous nature of

Now to conclude, the premisses considered which have been said of the Toad, the uses that are to follow are not many, except those which are already related in the Frog. When the Spaniards were in Bragus an Island of the New-found-world, they were brought to such extremity of famine, that a sick man amongh them was forced to eat two Toads, which he bought for two pieces of gold-lace, worth in Spain money fix. Duckats. I do marvel why in ancient time the Kings of France gave in their Arms the three Toals in a yellow field, the which were afterwards changed by Glodoveus into three Flower-de-luces in ofield Azure , as Arms fent unto him from Heaven.

When the Trojans dwell, neer Maotie, after the destruction of Troy, they were very much annoyed by the Gother, wherefore Margamirus their King, determined to leave that Countrey, and to feek some where elfe a more, quies habitation, Being thus minded, he was admonished by an Oracle that he should go and dwellin that Countrey where the River Rhene falleth into the Sea, and he was also firred up to take upon him that journey, by a certain Magitian-woman, called Alrunna, for this cunming Woman caused in the night time a deformed apparition to come unto him having three heads, one of an Eagle, another of a Toad, and the third of a Lyon, and the Eagles head did speak unto him in this manner, Genus tuum & Marcomire opprimet me, & conculeabit. Leonem, & interficiet bufouem; that is to lay, Thy flock or postericy, O Marcomirus, shall oppresse me, it shall tread the Lyon under foor, and kill the Toad. By which words he gathered, that his posterity should rule over the Romans,

fignified by the Eagle; and over the Germans, fignified by the Lyon; and over the French, fignified by the Toad, because the Toad, as we have said, was the ancient Arms of France. gnined by the 10au, because the 10au, as the Weafels of the water do ingender in copulation

It is an opinion new by some vertices, and feet of their belly, they do refemble them with the Toads of the water, for in their mouths, and feet of their belly, they do refemble them. Whereupon these verses were made .

> Bufones gigno putrida tellure sepulta, Humores pluvit forte quod ambo sumue Humet is & friget, mea fic vis bumet & alget, Cum perit in terra qui priue ignis erat. Which may be Englished thus;

Buryed in rotten earth, forth Toads I bring. Perhaps because me both are made of rain, That's moift and cold, moift I and ever freezing. When in the earth, that force from fire came.

And thus we will descend to discourse of the Toads poyson, and of the special remedies appointed for the same. First therefore, all manner of Toads, both of the earth and of the water are venomous. although it be held that the Toads of the earth are more poylonful then the Toads of the water, except those Toads of the water which do receive infection or poyson from the water, for some water are venomous. But the Toads of the land, which do descend into the marishes, and so live in both elements, are most venomous, and the hotter the Countrey is, the more full are they of povson

The Women-witches of ancient time which killed by poyfoning, did much use Toads in their confections which caused the Poet in his verses to write as followeth.

Occurrit Matrona potens, que melle Galenum Porreciura vire, mi(cet fitiente rubetam.

Which may be Englished thus; There came a rich Matron, who mixed Calen Wine With poyfon of Toads to kill ber Spouse, O deadly orime.

And again in another place.

-Funus promittere patrie Nec volo nec possum ranarum, in viscera nunquam

Infoext .-In English thus: I can nor will of Fathers death a promise make, For of Toads poyfon I never yet a view did take.

When an Asp hath eaten a Toad, their biting is incurable, and the Bears of Pamphilia and Cylicia, being killed by men after that they have eaten Salamanders or Toads, do poyfon their caters, We have faid already, that a Toad hath two livers, and although both of them are corrupted, yet the one of them is faid to be full of poyfon, and the other to reflit poyfon. The biting of a Toad, although it be feldom, yet it is venomous, and caufeth the body to swell and to break, either by Impostumation on, or otherwise, against which is to be applyed common Antidotes, as womens Milk, Triacle, roots of Sea-holm, and such other things. The spittle also of Toads is venomous, for if it fall upon a man, it causeth all his hair to fall off from his head; against this evil Paracelsus prescribeth a plaister of earth, mixed with the ipittle of a man.

The common people do call that humor which cometh out of the buttocks of a Toad when the swelleth, the urine of a Toad, and a man moistned with the same, be-pissed with a Toad; but the bell remedy for this evil, is the milk of a woman, for as it resembleth the poyson in colour, so doth it refift it in nature. The bodies of Toads dryed, and so drunk in Wine after they be beaten to powder, are a most strong poyfon, against which and all other such poyson of Toads, it is good to take Plantain and black Heilebore, Sea-crabs dryed to powder and drunk, the stalks of Dogs-tongue, the powder of the right horn of a Hart, the milt, ipleen, and heart of a Toad. Also certain fifthes salled Shel-crabs, the bloud of the Sea-tortoife mixed with Wine, Cummin, and the rennet of a Hare. Alfo the bloud of a Tortoife of the land mixed with Barley-meal, and the quintessence of Triacle and Oyl of Scorpions, aff these things are very precious against the poylon of Serpents and Toads.

We have promifed in the ftory of the Frog, to expresse in this place such remedies, athe larned Physicians have observed for the cure of the poyson of Progs. First therefore the poyson of the Frog causeth swelling in the body, depelleth the colour, bringeth difficulty of breating, maketh the breath strong, and an involuntary profusion of feed, with a general dulnesse and refinelle of body. body: for remedy whereof, let the party be inforced to vomit by drinking sweet Wine, and two drams of the powder of the root of Reeds or Cypresse. Also he must be inforced to walking and running, besides daily washing. But if a Fever follow the poyson or burning in the extremits, let the vomit be of water and Oyl, or Wine and Pitch; or let him drink the bloud of a Sector. toile, mixed with Cummine, and the rennet of a Hare, or elfe sweat in a Purnace or Hot-house a long time : besides many other such like remedies, which every Physician, both by experient and reading, is able to minister in cases of necessity, and therefore I will spare my further painting

Of the Hamorrhe. expressing them in this place, and passe on to the medicinal vertues of the Toad, and so conclude

We have shewed already that the Toad is a cold creature, and therefore the same sod in water. and the body anointed therewith, causeth hair to fall off from the members so anointed. There is a medicine much commended against the Gowt, which is this: Take fix pound of the roots of wilde Cucumber, fix pound of sweet Oyl, of the marrow of Harts, Turpentine, and Wax, of either fix ounces, and fix Toads alive, the which Toads must be bored through the foot, and hanged by a thred in the Oyl until they grow yellow, then take them out of the Oyl by the threds, and put into the faid Ovi the fliced root of a Cucumber, and there let it feethe until al the vertue be left in the Ovi Afterwards melt the Wax and Turpentine, and then put them all together in a glaffe, so use them morning and evening against the Gowt, Sciatice, and pains of the sinews, and it hath been seen that they which have lyen long fick, have been cured thereof, and grown perfectly well and able to walk. Some have added unto this medicine Oyl of Saffron, Opebalfamum, bloud of Tortoifes, Oyl of Sabine, Swines greafe, Quickfilver, and Oyl of Bays.

For the scabs of Horses, they take a Toad killed in wine and water, and so sod in a brazen yessel, and afterwards anoint the Horse with the liquor thereof. It is also said that Toads dryed in smoak, or any piece of them carryed about one in a linnen cloth, do ftay the bleeding at the nose. And this Frederick the Duke of Saxony, was wont to practise in this manner; he had ever a Toad pierced through with a piece of wood, which Toad was dryed in the smooth or shadow, this he rowled in a linnen cloth; and when he came to a man bleeding at the nose, he caused him to hold it sast in his hand until it waxed hot, and then would the bloud be stayed. Whereof the Physicians could never give any reason, except horror and fear constrained the bloud to run into his proper place, through fear of a Beast so contrary to humane nature. The powder also of a Toad is said to have the same vertue, according to this verse:

> Buffo ustus settit natura dote crnorem. In English thus: A Toad that is burned to ashes and dust Stays bleeding by gift of Nature just.

Theskin of a Toad, and shell of a Tortoyse, either burned or dryed to powder, cureth the Fiftyles: Some add hereunto the root of Laurel and Hen-dung, Sait, and Oyl of Mallows. The eyes of the Toad are received in Ointment against the Worms of the belly. And thus much shall suffice to have spoken of the history of the Toad and Frogs,

of the GREEN SERPENTS.

TNValue there are certain Green-ferpents, which of their color are called Grunling, and I take them to be the same which Helychine called Saurite, and Pliny by a kinde of excellency, Snakes, of whom we shall speak afterwards. for I have no more to say of them at this present, but that they are very venomous. And it may be that of these came the common proverb, Latet Anguis sub berba, under the greenherb lyeth the Green-fnake, for it is a friendly admonition unto us to beware of a falfhood covered with a truth like unto it.

of the HAMORRHE.

This Serpent hath such a name given unto it, as the effect of his biting worketh in the 1 bodies of men, for it is called in Latine, Hamorrhom, to fignific unto us the male, and Hamorrhois, to figuifie the female, both of them being derived from the Greek word Aims, which figuifieth blond, and Ree, which fignifieth to flow, because whomsoever it biteth, it maketh in a continual bleeding sweat, with exeremity of pain until it die. It is also called Affedius, and Afudius, Sabrine, and Helfadim, or Alfordim, which are but corrupted barbarous names from the true and first word Ha-

It is doubtful whether this be to be ascribed to the Asps or to the Vipers, for Isldorm, faith it is Pliny. skinde Asp, and Alians, a kinde of Viper. They are of a sandy colour, and in length not past one foot, or three handfule, whose tall is very sharp or small, their eyes are of a flery-flaming colour,

their head small, but bath upon it the appearance of horns. When they goe, they go firtight and slowly, as it were halting and wearily, whose pace is thus described by Nicander;

Ipsim oblique sua parvula terga Cerasta Claudicat: ex medio videm appellere dorso Parsum navigium, terit imam labrica tertem Alom, & hand allo tacitè trabit ilia mau, Ac per Arundineum fi transcat illa grabatum.

In English thus;
And like the Horned-Serpent, so trails this elf on land,
As though on back a little boat it drave,
His sliding belly makes paths be seen in sand.
As when by bed of Reeds she goes her life to save.

The scales of this Serpent are rough and sharp, for which cause they make a noyse when they goe on the earth; the semale resteth her self upon her lower part neer her tayl, creeping altogether upon her belly, and never holdeth up her head, but the male when he goeth holdeth up his head; upon her belly, and never holdeth up her head, but the male when he goeth holdeth up his head; their bodies are all set over with black spots, and themselves are thus paraphrstically described by Nicander;

Unum longs pedem, totoque gracillima tratin,
Ignes quandoque est, quandoque est candida forms,
Constrictumque set is collam, et tenusssima cauda.
Bina super gelidot oculos frons cornua profert,
Which may be Englished in this manner following;

Splendentem quadam radiorum albentia luce, Silvostres ut aper, populatricesque Locuste: Insuper horribile ac asprum caput bortes.

On foot in length, and slender all along,
Sometime of fiery bue, sometime milk-white it is,
The neck, bound in, and tayl most thin and strong,
Whose fore-head bath two horns above cold eyes:

anner sonowing; Which in their light refemble shining being, Like Bees full wilde, or Locusts sposteristed, But yet to look upon all horrible in seams, For why? the cruel Bore they shew in beal.

They keep in rocks, and stony places of the houses and earth, making their dens winding and hanging, according to these Verses;

Rimefat colit illa Petras, fibique affera tella,
Et modice pendens facit, inflexumque cubile.
In English thus;
The chinks of Rocks and passages in stone
They dwell, wherein their lodgings bare,
Alutle hanging made for every one,
And bending too their sleepy harbours are.

It is faid that Canobus the Governour of Menelaus, chanced to fall upon this Sexpent, interenge whereof Helen his charge, the wife of Menelaus broke his back-bone, and that ever fince that time they creep lamely, and as it were without loyns; which fable is excellently thus dekribed by Ni. cander;

Quondam animosa Helene cygni Jovie Inclyta proles
Eversa rediens Troia (nisi vana vetustas)
Huic indignata oss generi, Pharias ut ad oras
Venit, & adversi declinans slamina venti,
Fluciivagam statuit juxta Nill ossia classem.
Namque ubi nanclerus se sessua descenti est processos sternerei, et bibulis susua dormiret arents:
Lesa venenosos Hemortoois impulis titus,
Which may be Englished thus s

Illatamque tulit letali dente quietem:
Protinus ovipera cernent id filia Leda,
Oppressa medium serpenti fervida dosum
Infregits tritaqua excussit vincula spina;
Qua fragili illius sic dempta è cotpore sugits
Et gracises si amorrhoia, obliquique Cerasa
Ex hoc clauda trabunt jam soli tempore membra.

Once noble Helen, Joves childe by Swan-like shape, Returning back from Troy, destroyed by Grecian war, (If that our ancients do not with fables us beclap) This race was envied by Pharias anger farre, When to his shower for safety they did come, Declining rage of blustring windy seas, Water-biding-Navy at Nilus mouth gan run, Where Canobus all tyred, sainted for some ease: For there this Pilot, or Master of the Fleet, Did hast from boat to sleep in drety sand,

thus; Where he did feel the teeth of Hemorike dot, Where he did feel the teeth of Hemorike dot, Wounding his body with poylon, deaths own hand. But when egge-breeding Ludaes wench spread This harm, she press the Serpents book with stroky Whereby the hands thereof were all which Which in just wrath for just revegge she was all one out of this Serpents from And body they are taken, which is the case. That Cerasi sand lean Hamorris are ever some. Drawing their parts on eath by natures lawet.

They which are stung with these Hamorths, do suffer very intolerable torments, for out of the wound continually stoweth bloud, and the excrements also that cometh out of the belly and bloud, or sometimes little rouls of bloud in stead of excrements. The colour of the place bitten is black or sometimes little rouls of bloud in stead of excrements.

Of the Horned Serpent.

or of a dead bloudy colour, out of which nothing floweth at the beginning but a certain watery humour, then followeth pain in the stomack, and difficulty of breathing. Lastly, the powers of the body are broken, and opened, so that out of the mouth, gums, ears, eyes, singers ends, nayls of the feet, and privy parts, continually issued bloud, untill a cramp also come, and then followeth death, as we read in Lucan of one Tellm a young noble man, slain by this Serpent, described as solloweth;

Impressit dentes Hamórrhois aspera Tullo Magnanimo juveni, miratorique Catonio i Uique solet partiter totis, de essundere signis Coricii pressura croci: sicomina membra Emisere simul rutilum pro sanguine virus.

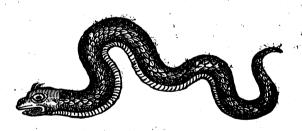

In English thus
The Hamorrhe fierce, in noble Tullus fastened teeth
That valiant youth, great Gatoes scholar deer:
And as when Saffron by Corycians skeeth
Ispess, and in his colour on them all appear:
So all his parts sent forth a poyson red

Sanguis erant lachryma: quacunque foramina novit Humor, ab ite largue manat cruor, ora redundant, Et patula nares, fudor rubet, omnia plenia; Membra fluunt venia: totum est pro vulnere corpue.

In stead of bloud: Nay all in bloud ment round.
Bloud was his tears, all passages of it were sped,
For our of mouth and ears did bloud abound.
Bloud was his sweat, each part his vein out-bleeds,
And all the bods bloud that one wound feeds.

The cure of this Serpent, in the opinion of the Ancients, was thought impossible, as written Disputes; and thereof they complain very much, using only common remedies, as scarification, using the state of the the scarification, using the state of the large of l

Of the Horned SERPENT.

His Serpent because of his Horns (although it be a kinde of Vipar) is called in Greek Rerasses, and from thence cometh the Latine word Cerasses, and the Arabian, Cerist, and Cerustes. It is called also in Latine, Ceristalia, Cristalia, Sirtalia, and Tristalia. All which are corrupted words, derived from Gerasses, or else from one another, and therefore I think it not fit to
stand upon them. The Hebrewes call it Schaphiphon, the Italians, Cerasses, the Germans, En geburnis
soliday; the French, Un Cerasse, un serpent Cornus, that is, a horned Serpent; and therefore I have so
called it in English, imitating herein both the French and Germans.

I will not frand about the difference of Authors, whether this Serpent be to be referred to the Alps or to the Vipers, for it is not a point materiall, and therefore I will proceed to the description of his nature, that by his whole history, the Reader may choose whether he will account him a subordinate kinde unto others, or elsa principall of himself. It is an African Serpent, beed in the Usian sandy seas, places not inhabited by men, for the huge Mountains of sands are so often moved by the windes, that it, is not only impossible for men to deell there, but also very dangerous and perilous to travel through them, for that many times whole troops of men and cattell, are in an infant overwhelmed and buryed in those sands. And this is a wonderfull work

of God, that those places which are least habitable for man, are most of all annoyed with the most dangerous biting Serpents.

The History of Serpents.

It is allo faid, that once these Horned Serpents departed out of Lybia into Egypt, where they depopulated all the Countrey. Their habitation is neer the high-wayes, in the fands, and under Carpopulated an the Country. they make both a found with their motion, and also a surrow in the earth, according to the faying of Nicander ;

Ex iis alter echis velocibus obvia feinis. Rello tergatibi prolixus tram te ducit. Sed medio diffusim bic cerastes se corpore volvit : Curvum errans per iter, resonantibu aspera squami. Which may be Englished thus:

Qualiter aquoreo longiffima gurgite naviu. Quam violentus agit nunc buc, nunc Africus illuc. Pellitur, et later um gemebunda fragore fuorum Extra (ulcandas finuofe fluctuat undas.

Of thefe the Viper with swift bones thee meets Trayling ber back in path dirett and frait, The Cerast more diffused in way thee greets With crooked turning, on scales make sounds full great :

Like as a ship toffed by the Western minde. Sounds afarre off, moved now bere, now there. So that by noyle of fhrilling fides me finde His furrowes turned in Seas and water phere.

The quantity of this horned Serpent is not great, it exceedeth not two cubits in length; theco. lour of the body is branded like fand, yet mingled with another pale white colour, as is to be free in a Hares skin. Upon the head there are two horns, and sometimes four, for which occasion it hath received the name Geraftes, and with these horns they deceive Birds; for when they are hungry, they cover their bodies in fand, and only leave their horns uncovered to move above the earth which when the Birds fee, taking them to be Worms, they light upon them, and so are devoured by the Serpent. The teeth of this Serpent are like the teeth of a Viper, and they fland equal, and not crooked: In flead of a back-bone they have a griftle throughout their body, which maketh them more flexible and apt to bend every way: for indeed they are more flexible then any other Serpent. They have certain red strakes crosse their back, like a Crocodile of the earth, and the skins of such as are bred in Egypt are very soft, stretching like a Cheverell-glove, both in length and breadth as it did appear by a certain skin taken off from one being dead; for being ftuffed with Hav. it shewed much greater then it was being alive, but in other Countreys the skins are not so.

I have heard this History of three of these Serpents brought out of Turkey, and given to a No.

ble man of Venice alive, who preserved them alive in a great Glasse (made of purpose) upon find in that Glaffe neenthe fire : The description asit here followeth, was taken by John Faloner, an English Travailer, saying They were three in number, whereof one was thrice so bigastheother two, and that was a female, and she was said to be their Mother; she had laid at that time in the Sands four or five Egges, about the bigneffe of Pigeons Egges. She was in length three foot, but in breadth or quantity almost so big as a mans Arm: her head was flat, and broad as two fingers.

the apple of the eye black, all the other part being white.

Out of her eye-lids grew two horns, but they were short ones, and those were truly Horns, and not flesh. The neck compared with the body was very long and small, all the upper part of theskin was covered with scales, of ash-colour, and yet mixed with black. The tail is at it were brown when it was fretched out. And this was the description of the old one : the other two being like to her in all things, except in their horns, for being small, they were not yet grown Generally, all these horned Serpents have hard dry scales upon their belly, wherewithall they make a noyse when they go themselves, and it is thus described by Nicander;

Nunc potes actutum, infidiatoremque Cerasten Nofgere, vipereum velutt genm, buic quia dispar Non is corpus habet, fed quatuor aut duo profert

Cornua, cum mutila videatur Vipera fronte. Squalidus albenti color est.

In English thus: You well may know the treacher Cerasts noyse, A Viper-kinde, whose bodies much agree, Tet thefe four borns and brandy colour, poyfe, Where Viper none, but forehead plain me fee.

There is no Serpent except the Viper that can fo long indure thirst as this horned Serpent, for they feldome or never drink; and therefore I think they are of a Vipers kinde: for belides this alfo it is observed, that their young ones do come in and out of their bellies as Vipen doe ! They live in hatred with all kinde of Serpents, and especially with Spiders. The Hawes of Rept allo de destroy horned Serpents and Sodrpions : but about Thebes in Agypt there are certain facred Snato (as they are termed) which have horns on their head, and thefe are harmleffe unto men and beaft, otherwise all these Serpents are virulent and violent against all creatures, especially men: ya there be certain men in Lybia called Pfilli, which are in a league; or rather in a natural control with horned Seipents. For if they be bitten by them at any time, they receive no hurt at all and he day they be they be betten by them at any time, they receive no hurt at all and he day to the service of the service and befides, if they be brought mto any man that is bitten with one of these Serpents, beforthe poyfon be foread all over his body, they help and cure him, for if they finde him but lightly hat, they only spit upon the wound, and so mitigate the pain, but if they finde him more deeply her,

then they take much water within their teeth, and first wash their own mouth with it, then foit out the water into a pot, and make the fick man to drink it up. Laftly, if the poyfon be yet ftrong, they lay their naked bodies upon the naked poyloned body, and fo break the force of the poylon. And this is thus described by the Poet, faying,

Audivi Lybicos Phlor, quos afpera Siriis Serpentumque ferax patria alit potulos. Non idu inflidum diro, morfuve venenum

Ledere: quin lasis forre & opem reliquie Non vi radicum proprio, fed corpore juntto.

That is to fav. The Lybian Pfylli, which Serpent breeding Systes dwell As I have heard, do cure posson, slings, and bites, Not hurt themselves, but it in other quell: By no roots force, but joyning bodies quites.

When a horned Serpent hath bitten a man or beaft, first about the wound there groweth hardnesse, and then pustules. Lastly, black, earthy and pale matter: the genital member standeth out straight and never falleth, he falleth mad, this eyes growdim, and his nerves immanuable, and upon the head of the wound groweth a scab like the head of a Nail, and continually pricking, like the pricking of Needles: And because this Serpent is immoderately dry, therefore the poyson is most pernicious; for if it be not holpen within nine dayes, the patient cannot escape death. The cure must be first by cutting away the flesh unto the bone, where the wound is, or else the whole memher if it can be, then lay upon the wound Goats dung fod with Vinegar or Garlike, and Vinegar or Barley-meal, or the juice of Cedar, Rue, or Nep, with Salt and Honey, or Pitch and Barley-meal. and such-like things outwardly : inwardly Daffadil and Rue in drink, Radish-seed, Indian Cummin. with wine and Costoreum, and also Calamint, and every thing that procureth vomit. And thus much for the description of the Horned Serpent.

Of the HYEN. A.

Here be some that make question whether there be any such Serpent as this or no, for it is not very like that there is any fuch, and that this Hyana is the felf same which is described to be a Four-footed Beaft, for that which is faid of that, is likewise attributed to this: namely, that it changeth fex, being one yeer a male, another yeer a female, and that the couples which feem to be marryed together, do by continuall entercourse, bring forth their young ones, so that the male this yeer is the female next yeer, and the female this yeer is the male next yeer. And this is all that is faid of this Serpent.

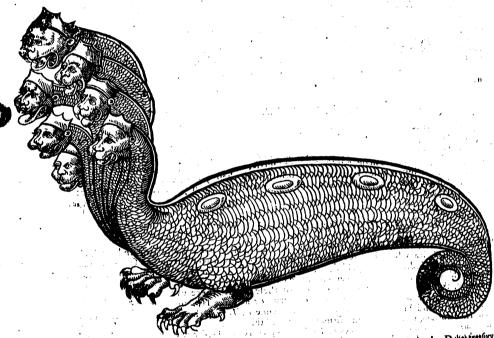

of the HYDRA, supposed to be killed by Hercules.

THe Poets do fain, that neer to the Fountain Anymona, there grew a Plantain, under which was bred a Hydra which had seven heads: whereof one of these heads was said to be immortall; with this Hydra Hercules did fight; for there was in that immortall head fuch a poylon as was uncurable; wherewithall Hercules movitened the head of his Darts after he had killed it : and they fay, that while Hercules struck off one of these heads, there ever arose two or three more in the room thereof, untill the number of fifty, or as fome fay, four core and ten heads were frucken off: and because this was done in the fenne of Linns, therefore there grew a Proverb of Lerna malorum, to signifie a multicude of unresistable evils.

And some ignorant men of late dayes at Venice, did picture this Hydra with wonderfull Art, and fer it forth to the people to be feen, as though it had been a true carkafe, with this inscription. In the year of Christs incarnation, 550, about the moneth of January, this monstrous Serpent was brought out of Turkey to Venice, and afterwards given to the French King; it was esteemed to be worth 6000. Ducats. These Monsters signifie the mutation or change of worldly affairs, but (I trust lid the Author of the inscription, who seemed to be a German) the whole Christian World is so afficted that there is no more evil that can happen to the, Christian World, except destruction; and therefore I hope that these Monsters do not toreshew any evil to the Christians. Therefore seeing the Turkish Empire is grown to that height, in which estate all other former Kingdomes fell, I may divine and prophelie that the danger threatned hereby, belongeth to the Turks, and not unto us, in whose Government this Monster was found to be bred : and the hinder part of his head seemeth to resemble a Turk, Cap. Thus far this inscribing Diviner. But this fellow ought first of all to have enquired about the truth of this Picture, whether it were fincere or counterfeit, before he had given his judgement upon it : For that there should be fuch a Serpent with seven heads, I think it unpossible, and no more to be believed and credited, then that Castor and Possible were conceived in an Egge, or that Pluto is the GOD of Hell, or that armed men were created out of Dragons teeth. or that Vulcan made Achilles his Armour, or that Venu was wounded by Diamedes , or that Vlyffes was carryed in Bottles, fo true I think is the shape of this Monster : for

of innecent SERPENTS.

the head, ears, tongue, noie, and face of this Monster, do altogether degenerate from all lunder of Serpents, which is not usuall in Monkers, but the fore-parts do at most times resemble the kinde to which it belongeth; and therefore if it had not been an unskilfull Painters device, he might have which it beas it is, how doth he know framed it in a better fashion, and more credible to the world. But let it beas it is, how doth he know tramed it in a petter fairnon, and inote tracks then to the Christians? For shall we be so blinde and that this evil doth more belong to the Turks then to the Christians? For shall we be so blinde and that this evil doth more belong to the sample our fins, but to lay all the tokens of judgement upon our adversaries? But if there appeared in us any repentance or amendment of those faults, for which God hath suffered in his justice, that impious Tyrant and Tyrannicall Government to prevail against Christians, then we might think that GOD would look mercifully upon us, and averthis gainst Christians, then we single think with forrow and grief be it spoken, all the Kings and peowrath from us upon our entitles. Down without stumbling in those vile courses, and odious crying fins, for which God hath fec up the Turks against former ages, and therefore we have no cause to hope that ever this rod shall be cast into the fire, untill the chastifement of Godschildren have procured their amendment, and if no amendment, then all the powers of heaven (the bleffed Trin. procured their amendament, and in mo antenut and deftruction, which God of his influite mercy ty excepted) cannot keep Chriffendome from ruine and deftruction, which God of his influite mercy turn away from us.

To turn again to the flory of the Hydra. I have also heard, that in Verice in the Duke treasury, among the rare Monuments of that City, there is preserved a Serpent with seven heads, which site true, it is the more probable that there is a Hydra, and then the Poets were not altogether detent that say, Herculer killed such a one. This Hydra which Herculer slew, they say was ingended bright that say, Herculer in and nourished by Juno in Leina, in hatred of Herculer: and they say slither, Echidna and T. pham, and nourished by Juno in Leina, in hatred of Herculer: and they say slither, that when he came to kill it, there came a Crab or Canter to help the Hydra against Hindle, who instantly called upon Islam for help, and so Islam slew the Crab, and He cases the Hydra.

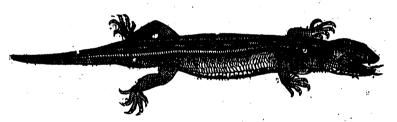

initantly called upon Islam for help, and is Islam flew the Crap, and He cales the Hydra. Phalephaim maketh the story of He cales by killing the Hydra, to be a meer allegory sping, that the Hydra was a Castle kept by fifty men, the King whereof was called Lernus, who was assisted by the Hydra was a Castle kept by fifty men, the King whereof was called Lernus, who was assisted by Noble man (called Cancer) against the assaults of Hercules, and that Hercules by the help of him, Noble man (called Cancer) against the assaults of Hercules, and that Hercules by the help of him, King of the store, overcame that King and Castle. Other say that Lerna and Hydra saisse out to be the monton whindes of Envy, distinguished by Invidia, and Invidentia, in himself, which arise out of the monton shifted from himself some head or tentation, so two or three other continually aroseinthe room thereof. And thus much for the Hydra, whether it be true or sabulous.

Doe read of two kindes of innocent Serpents, one called Libies, because they are only in Africk, and never do hurt unto men, and therefore Ningner was deceived, which maketh this kinde of Serpent to be the same with the Amobie, whose sting or teeth are very mortall and deadly. There be also other kindes of harmlesses, es that called Molurus, Musica, and Mylacia, which is said to go upon the tail, and it hath no notable property, except that one thing which giveth it the name, for Molurus is derived from Molis Ourin, that is hardly making water.

for Molerum is active it out review to introduce the property and the problem and Spathlurum, which whether they be one kinde or many, I will not fland upon, for they are all termed by the Germans, Hussuck, and Husseling, that is, a House-snake. They dive by hunting of Mice, and Weasels, and upon their heads they have two little ears, like to not ears, of a Mouse and because they be as black as coals, the Indian call them Stepe nero, and Carbon, and Garabonarso, and the French-men, Annuille de Hay, that is, a Snake of hedges. There be some that nourish them in Glasses with branne, and when they are at liberty they live in Dung-hills also, wherein they breed sometimes, they have been seen to suck a Cow, for then they twilt thour tails about the Cowes legs. Mantholus writeth, that the flesh of this Snake, when the head, tail, intrails, sat, and gall are cut off and cast away, to be a special remedy against the French-pox.

There are are also other kindes of Innocent Serpents, as that called Parea, and in Italy Baron, and Pagerina, which are brought out of the East, where these are bred. There be no other harmfull Serpents in that Countrey. They are of a yellow colour like Gold, and about four span iong: upon either side they have two lines or strakes, which begin about a hand breadth from their neck, and end at their tail. They are without poyson as may appear by the report of Gesner, for he did see aman hold the head alive in his hand. And thus much shall suffice to have spoken of Innocent Serpents.

of the LIZARD.

A lathough there be many kinds of Lizards, yet in this place I will intreat first of the vulgar Li-Azard, called in the Hebrew Letaab, Lanjertmossa, Lyjerda, Carbo, Pelipab, and Egose; the Chaldeans, Hailub, and Humera; the Arabians, Ataia, Albatbaie, or Albadaie, Haidun, Arab, Sampbras, Sagmbras, the Grecians in ancient time. Sauros, and Saura, and vulgarly, at this day Kolifaura; the Italians in some places, Liguro, Legerto, and Lucertala; about Trens, Kacani, and Ramarri, and yet Removisalso used for a Toad; the Spaniards, Lagarto, Lagarti, Lagartila, and Lagardina; the French, Lisards, the Germans, Adax, and when they distinguish the male from the semale, they expresse the male, Em Egochs, and the female, Eglet; in Histor, Lyderstob; in Flanders and Ilyria, Gesperka, and Cissier; the Latines, Lacertus, and Lacerta, hecause it hath across, and thousders like a man, and for this cancalso the Salamander, the Settlion, the Croccodile, and Scorpions are, also called sometimes Lacert, Lizards. And thus much thal suffice for the name.

The vulgar Lizard is described on this fort; the skin is bard and full of feales, according to this living of Vitalia

In Baglish thus :

These put away

and pointed Lizards, with their scale backs.

The colour of it is pale, and, diffinguished with certain rulty spots, as Plin writeth, with long strates or lines to the tail; but generally they are of many colours, but the green, with the white belly living in bushes, bedges, and is the most begunished, and most respected; and of this we stall peculiarly intreat hereafter. There have been some Lizards, taken in the biginping of September.

There is also another kinde of Lizard called Lacertue Solarie, a Lizard of the Sun, to whom Ecipher nin compareth certain Hereticks called Samplet, because they perceive their eye-fight to be dim and dull. They turn themselves sasting in their Caves to the East, or Sun-rising, whereby they recover their eye-fight again.

Of the Ligard.

The Pillure of the Lizard with the belly upward.

In Sarmatia, a Countrey of the Rutenes, there is a Province called Samogithia, wherein the Lizarda are very thick, black, and great, which the foolish Countrey people do worship very familiarly, as the Gods of good fortune; for when any good befalleth them, they entertain them with plentiful banquets and liberal chear: but if any harm or mischance happen unto them, then they withdraw that beralty, and intreat them more coursely, and so these dizzardly people think to make these Lizards by this means, more attentive and vigilant for their welfare and prosperity.

In the Province of Cataia, subject to the Tartars, there are very great Lizards, (or at least wife Serpents like Lizards) bred, containing in length ten yards, with an answerable and correspondent

compasse and thicknesse.

Some of these want their fore-legs, in place whereof they have claws like the claws of a Lyon, ortalons of a Falcon. Their head is great, and their eyes are like two great loaves. Their mouth and the opening thereof fo wide, as it may swallow down a whole man armed, with great, long, and sharp teeth, foss never any man or other creature durft without terror look upon that Serpent. Wherefore they have invented this art or way to take them.

The Serpent useth in the day time to lie in the Caves of the earth, or else in hollow places of Rocks and Mountains. In the night time it cometh forth to feed, ranging up and down feeking what it may devour, neither sparing Lyon, Bear, nor Bull, or smaller beast, but eateth all he meeteth with until he be fatisfied, and returneth again to his den. Now for as much as that Countrey is very loft and miry : the great and heavy Bulk of this Serpent maketh as it were a Ditch by his weight in the fand or mire, so as where you see the trailing of his body, you would think there had been rowled some great vessel full of Wine, because of the round and deep impression it leavest in the earth.

Now the Hunters which watch to destroy this beast, do in the day time fasten sharp stakes in the earth, in the path and passage of the Serpent especially neer to his hole or lodging, and these stakes are pointed with sharp Iron, and so covered in the earth or fand, whereby it cometh to passe, that when in his wonted manner he cometh forth in the night feafon to feed, he unawares fastneth his breath, or elfe mortally woundeth his belly upon one of those sharp-pointed stakes. Which thing the Hunters lying in wait observing, do presently upon the first noise with their swords kill him if he bealive, and so take out his gall which they sell for a great price, for therewithal the biting of a mad Dogis cured, and a woman in travel tasting but a little of it, is quicky discharged of her burthen. It is good also against the Hemroids and Piles. Furthermore, the flesh of this Serpent is good to be earen, and these things are reported by Paulm Venetus, and this story following.

As American Vesputim sayled in his journey from the Fortunate Islands, he came unto a Countrey where he found the people to feed upon fod flesh, like the flesh of a ferpent, & afterwards they found this beaft to be in all things like a Serpent without wings, for they faw divers of them alive, taken and kept by the people to kill at their own pleasure. The mouths whereof were fast tyed with ropes, has they could not open them to bite either man or beaft, and their bodies were tyed by the legs. The affect of these beasts was searful to his company, and the strangers which did behold it, for they took them to be Serpents, being in quantity as big as Roe-bucks, having long feet and ftrong claws, a speckled skin, and a face like a Serpent: from the nose to the tip of his tail, all along the back there grew a briftle, as it were the briftle of a Bore, and yet the faid Nation feedeth upon them, and because of their similitude with Lizards, I have thought good to insert their relation among the Lizards in this place, leaving it to the further judgement of the Reader, whether they be of this

In Celebus there are Serpents also or rather beatls remaining in the fenny places of the Country, whose bodies are all pild without hair like Serpents: also in their mouth, eyes, and tail they refemble them, and in their feet Lizards, being as great as Boars, and although they want poyfon, yet are

whose colour was like Braffe, yet dark and dusky, and their belly partly white, and partly of an whose colour was like Braine, yet daily had certain little pricks or spots like printed Scarres; their earthy colour, but upon either indexes; their eyes looked backward and the holes and paffages of their ears length was not part four impers of their feet were very small, being five in number, both before and behind were round, the ringers of them tee was the longest which standeth in the place of a man fore-singer, with small nails, and behind that was the longest which standeth in the place of a man fore-singer, with imail nails, and before from the other, as the thumb doth upon a mans hand, but on the foreseet all of them stand equall, not one behinde or before another.

relect all of them mand equality of the Stellions in this; that they have blond in their veins, and These little Lizards do giner from the actions in this; and they are covered with a hard skin, winking with the upper eye-lid, All manner of Lizards have a they are covered with a hard skin, winking with the upper eye-lid, All manner of Lizards have a they are covered with a maru sain, which when the property or at the least wife divided like the fishion cloven tongue, and the top thereof is somewhat hairy, or at the least wife divided like the fishion and figure of hair. Their teeth are also as small as hair, being black, and very sharp, and it seemeth and figure of hair. and figure of hair. Their teeth at any they bite, they leave them in the wound. Their lungs are also they are very weak, because when they bite, they leave them in the wound. Their lungs are allo they are very wear, to swell and receive winds by inflamation: their belly is uniform and simple, fmall and dry,) et apt to twen aund receive mall, and their stones cleave inwardly to their loyns; their intrails long, their Milt round round and small, and their stones cleave inwardly to their loyns; their intrails long, their introductions ; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of Ariffole, that the fame being cutoff, their tail is like the tail of a Serpent; and it is the opinion of the fame being cutoff. their tail is like the tail of a serpein s, are by Cardan, because imperfect creatures are full of moyth. groweth again. The reach wheter of do easily grow again. And Pliny reporteth that in his dayer he saw Lizards with double tails, whereunto America Vespusius agreeth, for he saith, that he saw in a ne law Lizarus with a double tail. They have four feet, two behinde and two before, and the former feet bend backward, and the hinder feet forward, like to the knees

ra man. Now concerning the different kinds of Lizards, I must speak as briefly as I can in this place, wherein I shall comprehend both the Countreys wherein they breed, and also their severall kinds, with fome other accidents necessary to be known. There is a kinde of Lizard called Guarell, or Viell, and Alguarill, with the dung whereof the Physitians do cure little pimples and spots in the face, and yet Bellunenfis maketh a question, whether this be to be referred to the Lizards or not, because Lizards

are not found but in the Countrey, out of Cities, and these are found every where, There is also another kinde of Lizard called Lacertus Mertenfis, which being salted, with the head and purple Wooll, Oyl of Cedar, and the powder of burnt Paper, fo put into a linnen cloth, and rubbed upon a bald place, do causethe hair that is fallen off to come again. There be other Lizards, called by the Grecians Arura, and by the Latines, Lacerta Poffinina, which continually abide in green caned by the Ortegan Zima, and by the fame mixed with the best wine and honey, do cureblinde

eyes by an oyntment.

Albertim writeth, that a friend of his worthy of credit; did tell him that he had feen in Province, a part of France, and also in Spate, Lizards at big as a mans leg is thick, but not very long, and these did inhabit hollow places of the earth, and that many times when they perceived a manor beaft pass by them, they would suddenly leap up to his face, and at one blow pull off his chiest. The heals is reported of Piemont in France, where there be Lizards as great as little Puppies, and that the people of the Countrey do feek after their dung or excrements, for the sweetnesse and other verues

In Lybia there are Lizards two cubits long, and in one of the Fortunate Islands called Counts,

there are also exceeding great Lizards.

In the Island of Diofeorides, neer to Arabia the leffer, there are very great Lizards, the fielh whereof the people cat, and the fat they feethe, and use in stead of Oyl: these are two cubits long, and I know not whether they be the same which the African call Duth, and live in the defensor L)bia. They drink nothing at all, for water is present death unto them, so that a man would think that this Serpent were made all of fire, because it is so presently destroyed with water. Being killed there cometh no bloud out of it, neither hath it any poylon but in the head and tayl. This the people hunt after to eat, for the tafte of the flesh is like the tafte of Frogs flesh, and when it is in the hole or den, it is very hardly drawn forth, except with spades and mattocks, whereby the palleges

are opened, and being abroad it is swift of foor.

The Lizards of India, especially about the Mountain Nifa, are 24 foot in length, their colour viriable, for their skin feemeth to be flourished with certain pictures, fost and tender to be handled. I have heard that there hangeth a Lizard in the Kings house at Paris, whose body is as thickes a mans body, and his length or itature little leffe; it is faid it was taken in a prifon or common Gaole, being found sucking the legs of prisoners: and I do the rather beleeve this, because I remember such a thing recorded in the Chronicles of France, and also of another somewhat lesser, preserved in the same City, in a Church called Saint Anthonies. And to the intent that this may feen no ftrange nor incredible thing, it is reported by Volatteran, that when the King of Portugall had conquered certain Islands in Athiopia, in one of them they slew a Lizard, which had devoured or swallowed down a whole infant, so great and wide was the mouth thereof: it was eight cubits long, and for a rare miracle it was hanged up at the gate Flumentana in Rome, in the roof, and dedicated to the Virgin Mary. Besides these, there are other kinde of Lizards, as that called Lacerta vermicularia, bectuleit liveth upon Worms and Spiders, in the narrow walls of old buildings. Alfo a filver-coloured Lizard called Liscome, living in dry and fun-fhining places. Another kinde called Senobras, and Adam, and Sennekie. Scenis a red L zard, as Silvation writeth, but I rather take it to be the Scinck, or Crocodile of the earth, which abound neer the red Sea.

Strabo. Solinm.

Avicenna.

Marcellus.

Ælianus. Polycletus.

their teeth very hurtful, where they fasten them. Like unto ghele are certain others bred in Hibmi. old in an Illand called Hypana, having prickles on their back, and a comb on their head, but withold , in an illand carred ryphala, having principles, with very fharp teeth. They are not much greater out voyce having four feet, and a test indifferently in trees, and on the earth, being very patient, and then mares of Comes, yet they have a kin fmooth and speckled like a Serpents, and they have a crap on the belly from the chin to the breaft, like the crap of a Bird.

Besides these, there are also some called Baibati, about the bignesse of Conies, and of a white aft colour, yet their skin and tail like a Snakes, and they refemble trapped Horses. They have four ash colour, yet their skin and tail like a Snakes, and they retemble trapped riories. They have four feet, and with the foremost they dig them holes in the earth, out of which they are drawn again like Conies to be eaten of men, for they, have a pleasant tast. To conclude, we do read that in the year 1543, there came many winged Serpents and Lizards into Genman, neer Syrla, and did bite many mortally: And in the year 1553, there were such bred in the bodies of men and women, and all returns the servers of the state of the servers in the servers. many mortally : All in the general discourse of Serpents, first of all recited in the be-

nning.
In all the nature of Lizards, there is nothing more admirable then that which is reported of them by Elianu of his own knowledge. When a certain man had taken a great fat Lizard, he did put out her eyes with an Instrument of Brasse, and so put her into a new earthen pot, which had in out her eyes with an intrument of branc, and to prent at, but too little to creep out at, and it two small holes or passages, big enough to take breath at, but too little to creep out at, and with her moist earth and a certain hearb, the name whereof he doth not expresse: and furthermore, he took an Iron Ring, wherein was fet an Engagataer Stone, with the Picture of a Lizardine graven upon it. And besides, upon the Ring he made nine several marks, whereof he put out evere day one until at the last he came at the ninth, and then he opened the pot again, and the Lizard didee as perfectly as ever he did before the eyes were put out: whereof Albertus enquiring the reason, could give none, but having read in Isiderw, that when the Lizards grow old and their sight dimor thick then they enter into lome narrow hole of a Wall, and fo fet their heads therein, directly looking towards the East or Sun-rising, and so they recover their sight again. Of this Albertu giveth good reason, because he saith, the occasion of their blindenesse cometh from frigidity congening thehumor in their eyes, which is afterward attenuated and diffolved by the help and heat of the Sun. The voyce of the Lizard is like the voyce of other Serpents, and if it happen that any man by chance do cut the body of the Lizard afunder, fo as one part falleth from another, yet neither part yeth but goeth away the upon two legs that are left, and live apart for a little feafon, and if it happenthat they meet, again, they are so firmly and naturally conjoyned by the secret operation of nature, soil they had never been severed, only the scar remaineth.

They live in caves of the earth, and in graves, and the green Lizards in the fields and Gardens, but the yellowish or earthy brown Lizard aniong hedges and thorns. They devour any thingthat comes to their mouth, especially Bees, Emmets, Palmer-worms, Graffehoppers, Locusts, and such likethings, and four months of the year they lie in the earth and eat nothing.

In the beginning of the year about March, they come out again of their holes, and give themselves to generation, which they perform by joyning their bellies together, wreathing their tails together, and other parts of their bodies; afterwards the female bringeth forth Bgges, which the committeth to the earth, never fitting upon them, but forgetreeh in what place they were laid (forfite hath no memory.) The young ones are conceived of themselves, by the help of the Sun. Some there be which affirm, that the old one devoureth the young ones affoon as they be hatched, except one which the fuffereth to live, and this one is the bafeft and most dullard, having in it least sprit of all the residue: yet notwithstanding, afterwards it devoureth both his parents, which thing is proved falle by Albertin, for feeing they want memory to finde out their own Egges, it is not likely that they have so much understanding as to discern their own young ones, nor yet so unnatual asto defroy the noblest of their brood, but rather they should imitate the Crocodile, which killest the base and spareth the best spirits.

It is affirmed, that they live but half a year or fix months, but it is also falle, for they hide themfelves the four coldest moneths; and therefore it is likely that they live more then fix, foreste what time should they have for generation? Twice a year they change their skin, that is in the Spring and Autumn, like other Serpents that have a foft skin, and not hard like the Tortoifes. Their place of conception and emission of their Egges is like to Birds: and therefore it is a needlessequestion to enquire whether they bring egges forth of their mouth or not, as some have foolishly affirmed, but without all warrant of truth or nature.

They live by couples together, and when one of them is taken, the other waxeth mad and rageth upon him that took it, whether it be male or female: In the Old Testament Lizards, Wessels, and Mice are accounted impure beafts, and therefore forbidden to be eaten, not only because they live in Graves and design inconstancy of life, but also theeves and treatherous persons. They are assistant of every noife, they are enemies to Bees, for they live upon them; and therefore in antent time they mixed Meal and juyce of Mallows together, and laid the same before the Hives, to drive any Lizards and Crocodiles. They fight with all kinde of Serpents; also they devour Snail, and contend with Toads and Scorpions. The Night-owls and Spiders do destroy the little Lizards, for the Spider doth so long winde her thred about the jaws of the Lizard, that he is not able to optnill mouth, and then the fasteneth her things in her brains. The Storks are also enemies to Lizard, and then the fasteneth her things in her brains. cording to this faying of the Poet;

Serpente ciconia Pullos Nutrit es inventa per deviarura lacerta. In English thus: With Lizards young and Serpents breed. The Stork Geketh ber young ones to feed.

Notwithstanding, that by the law of God, men were forbidden to eat the Lizard, yet the Trockditt, Elbiopians, did eat Serpents and Lizards, and the Amazons did eat Lizards and Tortoiles, for indeed those women did use a very thin and slender diet; and therefore Calina doth probably coniedere, that they were called Amazoni, because Mazie carebant, that is, they wanted all manner of decoure, that We have also shewed already, that the Inhabitants of Diojeorides Isle, do eat the fiesh of Lizards, and the fat after it is boyled, they use in stead of Ovl.

Concerning the venom or poyfon of Lizards. I have not much to fay, because there is not much thereof written: yet they are to be reproved which deny-they have any poyfon at all, for it is manitest that the flesh of Lizards eaten, (I mean of such Lizards as are in Italy.) do cause an influmation and apoltumation, the heat of the head-ach, and blindenesse of the eyes. And the Egges of Lizards do kill speedily, except there come a remedy from Faulkons dung and pure Wine. Also when the Lizard biteth, he leaveth his teeth in the place, which continually aketh, until the teeth be taken out: the cure of which wound is first to suck the place, then to put into it cold water, and afterward to make a plaister of Oyl and Ashes, and apply the same thereunto. And thus much for the natural description of the Lizard.

The medicines arising out of the Lizard, are the same which are in the Crocodile, and the flesh thereof is very hot: wherefore it hath vertue to make fat, for if the fat of a Lizard be mixed with Wheat-reeal, Halinitre, and Cumin, it maketh Hens very fat, and they that eat them much fatter : for Cordan faith, that their bellies will break with fatnesse, and the same given unto Hawks. maketh them to change their feathers.

A L-zard diffected, or the head thereof being very well beaten with Salt, draweth out Iron points Marcellus. of nails, and splents out of the flesh or body of man, if it be well applyed thereunto, and it is also haid that if it be mingled with Ovl, it causeth hair to grow again upon the head of a man, where an Ulcer made it fall off. Likewise a Lizard cut asunder hot, and so applyed, cureth the stinging of Scornions, and taketh away Wens.

Inancient time with a Field-lizard dryed and and cut afunder, and so bruifed in pieces, they did draw out teeth without pain; and with one of thefe fod and stamped, and applyed with Meal or Frankincense to the fore-head, did cure the watering of the eyes.

The same burned to powder, and mixed with Cretick Hony by an Ointment, cureth blindenesse. The Oyl of a Lizard put into thereat, helpeth deafne (fe, and driveth out Worms if there be any therein. If children be anointed with the bloud fasting, it, keepeth them from f wellings in the belly and legt: also the liver and bloud lapped up in Wooll, draweth out nails and thorns from the flesh, and curethall kinde of freckles, according to this verse of Serenus;

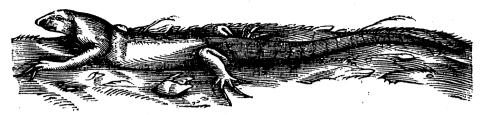

> Verrugam poterit farguis curare Laceita. That is to fay; The bloud of Lizards can, a con-

The urine (if there be any at all) helpeth the Rupture in Infants. The hones taken out of the Lizards head in the full Moon, do scarifie the feeth, and the brain is profitable for suffusions: The liver laid to the gums, or to hollow teeth, eafeth all pain in them. The dung purgeth wounds, and also taketh away the whitenesse and itchingtof the eyes, and so sharpneth the sight, and the sme with water, is used for a salve. Arnold w doth much commend the dung of Lizards mixed with Meal, the black thereof being cast away, and so dryed in a furnace, and sofened again with water of Nitre, and froth of the Sea, afterwards applyed to the eyes in a cloth, is vary profitable against all the former evils. And thus much thall fuffice to have spoken of the first and vulgar kinde of Lizard: for killing of whom Apollo was in ancient time called Saurotionos.

of the GREEN LIZARD.

He greater Lizard which is called Lacerta Kirldie, the green Lizard, by the Grecians, Chlorofaura; by the Italians, Gez, and by the Germans, Gruner Heyden, is the same which is called Ophiomacom, because it fighteth with Serpents in the defence of man. They are of colour green, from whence they are named, and yet sometimes in the Summer they are also sound pale. They are twice so big atthe former Lizard, and come not neer houses, but keep in Madows and green fields. They only abound in Itely, and it is a beaft very loving and friendly unto man, and an enemy to all other Serpents. For if as any nime they fee a man, they instantly gather about him, and laying their heads at the one side, with great admiration behold his face: and if it chance a man do foit, they lick up the

specie joyiully, and it hath been feen that they have done the like to the urine of children, and they are also handled of children without danger, gently licking mosture from their mouths. And if at any time three or four of them be taken, and so let together to fight, it is a wonder to see how eagerly they wound one another, and yet never set upon the man that put them together.

If one walk in the fields by hollow ways, bushes, and green places, he shall hear a noise, and see motion as if Serpents were about him, but when he looketh earnestly upon them, they are Lizard wagging their heads, and beholding his person: and so if he go forward they follow him, if he stand still they play about him. One day (as Frasmu writeth) there was a Lizard seen to fight wish a Serpent in the mouth of his own Caye, and whilest certain men beheld the same, the Lizard received a wound upon her cheek by the Serpent, who of green, made it all red, and had almost it all off, and so hid herself again in her den. The poor Lizard came running unto the beholders, and off, and so hid herself again in her den. The poor Lizard came running unto the beholders, and she were desiring help and commisseration, standing still when they shood still and following when they went forward, so that it acknowledged the soveraignty of man, appealing unto him as the chief Justice, against all his enemies and oppressors in the fields.

Ing unto thin as the third Junes, that many times while men fall affeep in the fields, Serpents come It is reported by the Italians, that many times while men fall affeep in the fields, Serpents come creeping unto them, and finding their mouths open, do flide down into their flomachs: Wherefore, when the Lizard feeth a Serpent coming toward a man fo fleeping, the waketh him, by gently feratch-

ing his hands and face, whereby he escapeth death and deadly poylon.

The use of these green Lizards, is by their skin and gall to keep apples from rotting, and also to drive away Caterpillers, by hanging up the skin on the tops of trees, and by touching the apples with the said gall: also when the head, feet or intrails are taken away, the flesh of the green Lizard is given in meat to one that hath the Sciatica, and thus much for the natural uses of the green Lizard.

The remedies arifing out of this Lizard, are briefly these: First it is used to be given to Hawk, and to be eaten in small pieces, provided so as it be not touched with their talons; for it will have their feet, and draw their claws together; also they see the it in water, then beat it in a mortar. Lasting, when they have poured warm water upon it, they let the Hawk wash her seet in it, and so it cause there to cast her old seathers and coat, and bringeth a new in the room thereof. This Lizard eaten with sauces to take away the loathing thereof, is good for the Falling-evil: and being sod in three pintes of Wine, until it be but one cup full, and thereof taken every day a spoonful, is good for them that have a disease in the lungs. It is also profitable for them that have pain in the loins. And there are many ways to prepare it for the eyes, which will not stand to relate in this place, because they are superstitious, and therefore likely to do more harm then good to the English Reader.

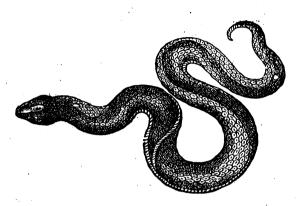

There is an Oyl made of Lizards, which is very precious, and therefore I will describe it as I finde it in Brajavolus. Take seven green Lizards, and thangle them in two pound of common Oyl, there let them soke three days, and then take them out, and afterwards use this Oyl to anoint your face every day, but one little drop at once, and it shall wonderfully amend the same. The reason hereof seemeth to be taken from the operation of the dung or excrements, because that hath vertue to make the same white, and to take away the spots.

If the upper part in the pastern of a Horse be broken, put thereinto this Oyl with a little Vinegar, then rub the hoof about therewith, so shall it increase and grow again, and all the pain thereof shall passe away. The making of the medicine is this: Take a new earthen pot, put thereinto three passes of Oyl, wherein you must drown your Lizards, and so feethe them till they are burned away, then take out the bones, and put in fost Lime half a pound, liquid Pitch a pinte, of Swines greate two pound; then let them be allstood together again & afterwards preserved and used upon the hoof as need shall require: for it shall fasten and harden the Horses hoof, and there is nothing better for this purpose then this Oyl. The afters of a green Lizard do reduce shars in the body to their own to have

The bones of a green Lizard are good against the Falling-evil, if they be prepared in this manner following: Put your green Lizard alive into a versel full of Salt, and there shue it in safe, so in sw days it will consume all the stefand intrails from the bones, and so the bones may be taken and we in this case like the hoof an Elk, which are very precious for this sicknesse, and no less precious these bones. The bloud doth care the beating bruizings and thick skins in the sect of men and brist, being applyed in slocks of Wooll.

The eye is superstituously given to be bound to ones arm on a quartane Ague, and the eyes pressed out alive, and so included in golden buttons or bullets, and carryed about, do also help the pain of the eyes, and in default hereof the bloud taken out of the eyes in a piece of Purple wooll, hath the same operation. The heart of a Lizard is also very good against the exulcerations of the Kingsevil, if it be but carryed about in the bosome in some small silver vessel. The gall taketh away the hairs upon the eye-lids that are unseemly, if it be dryed in the same to the thicknesse of Honey, especially in the Dog-days, and mixed with White-wine; then being anointed upon the place, it never sufferent the hairs to grow again. And thus much for the History of the green Lizard.

of the MILLET or CENCHRINE.

This Serpent called by the Grecians Cenchros, Cenchrines, Cenchridon, and Cenchrites; is by the Latines called Cenchria, Cenchrius, and Milliaria: because it cometh abroad at the time that Milletfeed foureth, and is ready to ripe, or else because it hath certain little spots upon it like Milletfeed; and is also of the same colour. It is likewise barbarously called Famusus, Anabis, and Fasivisus. The Germans of all others have a name for it, for they call it Punter-seblang, and Berg-schlang. Other Nations not knowing it cannot have any name for it; and therefore I cannot faign any thereof, except I should lie grossylin the beginning of the History. This Serpent is only bred in Lemnia and Sametrasia, and it is there called a Lyon, either because it is of very great quantity and bignesse, or else because the scales thereof are spotted and speckled like the Lybian Lyons: or because when it sight. Nicander, either tail is turned upward like a Lyons tail, and as a Lyon doth. But it is agreed at all hands, that Gillius. it is called Milliaria, a Millet, because in the spots of his skin and colour it resembleth a Millet-seed; Lucari, which caused the Poet to write on this manner;

Pluribus ille notis variatam tingitur alvum, Qu'am parvis tincius maculis Thebanus Ophites. In English thus; With many notes and spots, his belly it bedyed Like Thebane ber, Ophites sightly tryed.

But not only his belly, for his back and whole skin is of the same fashion and colour. The length of this Serpent is about two cubits, and the thick body is attenuated toward the end, being sharp at the tail. The colour is dusky and dark like the Millet, and it is then most ireful and sull of wrath or courage, when this herb or feed is at the higosit. The pace of this Serpent is not winding or traviling, but straight, and directed without bending to and fro: and therefore saith Lucan; Et semper reliably sur straight and right line, and for this cause when a man styeth away from it, he must not run directly sorward, but winde to and fro, tooking like an Indenture, for by reason thereof this Serpents large body cannot so easily and with the sepecal turn to follow and persue, as it can directly forward.

It is a very dangerous Serpent to meet withal, and therefore not only the valiantest man, but also the strongest beast is, and ought justly to be afraid thereof, for his treacherous deceits and strength of body; for when it hath gotten the prey or booty, he beclapseth it with his tail, and giveth it starful blows, in the mean time sasteneth his jaws or chaps to the man or beast, and sucketh out all the bloud till it be sully satisfied; and like a Lyon he beateth also his own sides, setting up the spires of his body when he assateth any adversary, or taketh any resisting booty. It take this to be the same called in Sicilia, Sapasferena, which is sometimes as long as a man, and as great as the arm about

Palladius. Pliny

Asrcellus.

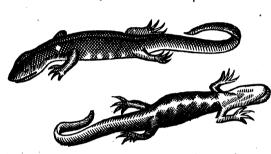

Of the Pelias.

the wrift. In the heat of Summer they get themselves to, the Mountain, and there seize upon cattel of all forts, as often as anger or wrath enforceth them.

The nature of it is very hot, and therefore venomous in the fecond degree: wherefore when it The nature of it is very not, and therefaction and rottennesse, as fiesh where water lyeth betwirt the skin, like as in the Dropfie: for besides, the common affections it hath with the Viper, and the bi skin, like as in the Drophe: to be deadly and unrefiftible evils followeth, as drouzy, fleepinesse, the things, more deadly and unrefiftible evils followeth, as drouzy, fleepinesse, the control of the pain in the liver and flower the control of t and Lethargy, and pain in the belly, especially the Colick, pain in the liver and stomach, killing with in two days, if remedy be not provided.

The cure is like the cure of the Vipers biting, Take the feed of Lettice, and Flax-feed, Savory beaten or stamped, and wilde Rue, wilde Betony, and Dassadit two drams in three cups of Wine, and drink the same, immediately after the drinking hereof, drink also two drams of the root of Centau. rv. or Hartwort, Nosewort, or Gentian, or Sesamine. And thus much for a description of this venomous Serpent, one of the greatest plagues to man and beast in all those Countries or places, where, in it is ingendered, and it is not the least part of English happinesse to be freed by God and Nature from such noysome, virulent and dangerous neighbours.

of the NEVTE or WATER-LIZARD.

His is a little black Lizard cal. led Waffermoll, & Wafferadden, that is a Lizard of the Water. In French . Taffot ; and in Italian Mevafandola, which word is derived from Maraffo, a Viper, because the poylon hereof is like the poylon of Vipers, and in the Greek it may be termed Enudros Sauros. They live in standing waters or pools, as in ditches of Towns and Hedges. The colour as we have faid is black, and the length about two fingers, or scarle fo long. Under the belly

it is white, or at least hath some white small spots on the sides and belly: yet sometimes there are of them that are of a dufty earthy colour, and towards the tail yellowish. The skin is strong and hard fo as a knife can fearle cut the fame, and being cut, there iffueth out a kinde of white mattery liquor, like as is in Salamanders.

Being taken, it shutteth the mouth so hard as it cannot be easily opened, neither doth it enderour to bite, although it be plucked and provoked. The tongue is very thort and broad, and the teeth fo foort and small, as they are scarcely visible within the lips. Upon the fore feet it hath four fingers or claws, but upon the hinder-feet it hath five. The tail standeth out betwixt the hinder-legs in the middle, like the figure of a wheel-whirl, or rather fo contracted, as if many of them were conjoyned together, and the void or empty places in the conjunctions were filled. The tail being cut of, liveth longer then the body, as may be feen in every days experience, that is, by motion given longer fignes and token of life.

This Serpent is bred in fat waters and soils, and sometimes in the ruines of old walls, especially they delight in white muddy waters, hiding themselves under stones in the same water if these be any, and if not, then under the banks fide of the earth, for they seldome come to the land. They fwim underneath the water, and are rarely seen at the top. Their egges are not past so big as peale, and they are found hanging together in clusters. One of these being put alive into a glasse of water, did continually hold his head above the water like as Frogs do, fo that thereby it may be conjectured it doth often need respiration, and keepeth not under water except in fear, and feeking af-

There is nothing in nature that so much offendeth it as Salt, for so soon as it is laid upon Salt, it endeavoureth with all might and main to run away, for it biteth and flingeth the little Beafts above measure, fo that it dyeth sooner by lying in Salt where it cannot avoid, then it would by suffering many fripes, for being beaten it liveth long, and dyeth very hardly. It doth not like to be without water, for if you try one of them, and keep it out of water but one day, it will be found to be much

Being moved to anger, it standeth upon the hinder-legs, and looketh directly in the face of him that hath flirred it, & fo continueth til all the body be white, through a kind of white humor or poyfon, that it fwelleth outward, to harm (if it were possible) the person that did provoke it And by this is their venomous nature observed to be like the Salamander, although their continual abode in the water, maketh their poyfon the more weak.

Some fay that if in France a Hog do eat one of thefe, he dyeth thereof, and yet doth more fafely eat the Salamander. But in England it is otherwise, for I have seen a Hog without all harm carrying his mouth a Newt, and afterward eat it. There be some Apothecaries which do use this Newt in

and of Skinks or Grocodiles of the earth, but they are deceived in the vertues and operation and do alfo. deceive other, for there is not in it any fuch wholefome properties, and therefore not to be applyed without fingular danger. And thus much may suffice to be said for this little Serpent, or Water creeping creature.

Of the PELIAS.

Eilm making mention of the Elaps and Pelias, two kindes of Serpents, doth joyntly freak of A them in this fort, faying that the fignes of these Serpents were so common and vulgarly known, that there was no descriptions of them among the ancient Writers. But the Pelias biting caufeth putrefaction about the wound or bitten place, but yet not very dangerous, and it bringth obluscation or dimnesse to the eyes, by reason that as the poyson is universally distributed over en oblineation, fo it hath most power over the tenderest part, namely the eyes. It is cured by a Ptifane with Oyl in drink, and a decoction of fuch Docks as grow in ditches, and other simple meditines, fuch as are applyed to the curing of the Yellow-jaundise. The eyes must be washed with the urine of a childe or young man which never knew any woman carnally, and this may be applied either simply and alone, or elfe by Brine and Pickle, fo also must the head. After that the body is purged, anoint it with Balfamum and Honey, and take an Eye-falve to sharpen again and recover the fight, and for this cause it is very good to weep, for by evacuation of tears, the venom alfo will be expelled. But if the eyes grow to pain, then let their Eye-falve be made more temperate and gentle, to keep the head and brain from stupefaction. And thus much for the Pelias out of Aetius.

of the PORPHYRE.

Here is among the Indians a Serpent about the bigneffe of a span or more, which in outward aspect is like to the most beautiful and well coloured Purple, the head hereof is exceeding white, and it wanteth teeth. This Serpent is fought for in the highest Mountains, for out of him they take the Sardius flone. And although he cannot bite because he wanteth teeth, yet in his rage when he is persecuted, he casteth forth a certain poyson by vomit, which causeth putresaction where everit lighteth. But if it be taken alive and be hanged up by the tail, it rendereth a double, one whiles it is alive, the other when it is dead, both of them black in colour, but the first resembleth black Amber. And if a man take but so much of the first black venom as is the quantity of a Selamine feed, it killeth him presently, making his brains to fall out at his nostrils, but the other worketh neither fo speedily, nor after the same manner ; for it casteth one into a Consumption, and killeth within the compasse of a year. But I finde Ælianus, Volateran, and Textor to differ from this relation of Ctefias, for they fay, that the first poyfon is like to the drops of Almond trees, which are congealed into a gum, and the other which cometh from it when he is dead, is like to thin mattery water. Unto this Porphyre I may add the Palmer Serpent, which Strabo writeth doth kill with an unrecoverable poylon, and it is also of a Scarlet colour, to the loyns or hinder-parts.

Of the PRESTER.

Lthough there be many Writers which confound together the Prefter & the Diplas, and make A of them but one kinde, or Serpent of divers names, yet feeing on the contrary there he as many or more which do distinguish or divide them, and make them two in nature different, one from another, the Diplas killing by thirft, and the Profter by heat, as their very names do fignifie, therefore I will also trace the steps of this latter opinion, as of that which is more probable and confoment to truth.

The Greciaus callit Prefter of Pretbein, which fignifieth to burn or inflame, and Tremellius and Junius think, that the Serpents called fiery Serpents, which did fting the Ifraelites in the Wildernelle, were Presters. We finde in Suidas, Prester for the fire of Heaven, or for a cloud of fire carryed about with a vehement strong winde, and sometimes lightenings. And it seemeth that this is indeed a fiery kinde of Serpent, for he himfelf always goeth about with open mouth, panting and bread thing as the Poet writeth

> Oraque diftendens avidus fumantia Prester. Inficit, ut lasus tumida membra gerat. Which may be Englished thus; The greedy Profters wide-open faming meuth Infects, and swelleth, making the members by heat uncouth.

When this Serpent hath struck or wounded, there followeth an immeasurable swelling, distradion, conversion of the bloud to matter, and corrupt inflamation taking away freedom or easinesse

of afpiration, likewife dimming the fight, or making the hair to fall off wom the head; at las last of afpiration, likewite dimming me ugue, or making the many with his forestion as it wereby fire, which is thus described by Manual 1984 the person of backlassing by a forest of the control of the cont ing as followeth granders grander.

Ecce (ubit facies leto diversa fluenti. Natsidium Marfi cultorem torridue agri Percuffit prefter : illi rubor igneus ora Succendit tendity; cutem pereunte figura, Succendit, tendity; cutem pereunte figura,

Missens own a tumor toto jam corpor emasor.

Missens own a tumor toto jam corpor emasor.

Humanumy, egross modum saper annika membra.

Humanumy, egross modum saper annika membra. Efflatur Sanies, late tollente veneno. Ipje late penitus angesto corpore mer fas.

Nec lorica tenet diftenti corporis auctum. Spumeus accenso non sic exundat abeno Undarum cumulus: nec tanto carbasa Coro Curvavere finus : tumides jam non capit artue Pland Impune fer is , non aufi tradene basto. 1 2 andum frante modo crefcens fugere cadaver.

Which may be thus Englished; Lo suddenly a divers fate the joyful current stayed, Narfidius, word Marfinus mirror did adore, By burning fling of soorohing Prester dead was layed;
For fiery colour bit face enslamed, not be before.

The first appearing vilage faild, all was out siretcht, Swelling covered all, and bodies grofneffe doubled Surpaffing humane bounds and members all ore reacht, Affiring venom freads matter blown in carkaffe troubled. The man lyeth drownd within fmoln bodies banks, No girdle can bis monstreus growth contain. Not so are waters swoln with rage of sandy flanks, Nor fails bend down to bluftering Corus wain. Now can it not the swelling sinews keep in bold, Deformed globe it u, and trunk ore-come with waight, Untoucht of flying Fowle, no beakt of young or old. Do him dare est 3 est brafts full wilde upon the body bait, But that, they die: No manto sbury mearth or fire : 1 Durft once come night when stand to look upon that hapless case, were for never couled the beat of corps though doad to finel, Therefore afraid they ran away with fo eedy pace.

The cure of the poylon of this Serpant, is by the Physicians found out to be wilde Purssin, allo the flowers and falk of the bush, the Beavers Rone called Coffereum, drunk with Opoponax and Rew in Wine, and the little Sprat-fish in diets And thus much of this fire-hurning venomous Serpent. were a round by hide of no and

of the RED SERPENT.

This kinde of Serpent being a Serpent of the Sea, was first of all found out by Pelicerius Bishop of Montpelier, at Rondoletus writeth, and although fome have taken the fame for the Mysus or Berus, of which we have spoken already, yet is it manifest that they are deceived, for it hah gills covered with a bony covering and also fins to fwim withal, much greater then those of the My. rus, which we have thewed already to be the male Lamprey. This Serpent therefore for the outwid proportion thereof, is like to the Seepents of the land; but of a red or purplish colour, being full of crooked or oblique lines, descending from the back to the belly, and dividing or breaking that long line of the back, which beginneth at the head, and so freetcheth forth to the tail.

The opening of his mouthle not were great, his teeth are very fharp and like a faw, his gis like fealy fifthes, and upon the ridge of his back, all along to the tail, and underneath upon the rine or brim of his belly are certain hairs growing, or at the leaft thin final things like hairs, the tail being the control of the beautiful description. thut up in one undivided fine. Of this kind no doubt are those which Bellonius faith he saw by the lake Abjeut, which live in the waters, and come not to the land but for fleep, for he affirmeth that they are like land Serpents, but in their colour they are red spotted, with some small and dusky spot. Gillin alfo faith, that among the multicude of Sea Serponts, fome are like Congers, and I cannot tell whether that of Virgil be of this kinde or not, spoken of by Laccoon the Priest of Neptune.

Solennes taurum ingentem maclabat adianas. Ecce autem gemini à Tenedo exanquille per alta (Horrerco velerens) immensis orbibus angues Incumbunt perago : pariterq; addittora tendunt.

"at, which a prompt of

Will not contrary their opinion which reckon the Salamander among the kindes of Lizardy, but leave the affertion as fome what tolerable: yet they are not to be followed, or to be bear lieved, which would make it a kinde of Worm, for there is not in that opinion either reason of resemblance. What this Beast is called among the Hebrews I cannot learn, and therefore I judge that the Jews, (like many other Nations) did not acknowledge that there was any firth kinde of greature's for ignorance bringeth infidelity in ftrange things and propo-

The Grecians, call it Salamandra, which word or term is retained almost in all languages, especially in the Latine, and therefore Islave had more boldnesse and wit, then reason, to derive the Latine Sa-lamended, quasi Vallacendrams, resisting burning, for being a Greek word, it needeth not a Latine notation. The Arabians call it Saembras, and Samabras, which may well be thought to be derived or rather corrupted, from the former word Salamandra, or elfe from the Elebrew word Semants, which fignifieth a Stellion. Among the Italians and Rhattans it retaineth the Latine word; and sometimes in Rhelisit is called Refela. In the Dukedom of Savoy, Pluvins. In France, Sound, Blande, Albrenne, and draffade, according to the divers Provinces in that Kingdom. In Spain it is called Salamantegua. In Germany it is called by divers names, as Meall, and Punter meall, Olm, Mell, and Moleb, because of a kinde of liquor in it like milk, as the Greek word Molge, from amelgein to fuck milk. Some in the Countrey of Helvetta do call it Quattertesb. And in Albertus it is likewise called Rimatrix. And thus much may fuffice for the name thereof.

The description of their several parts followeth, which as Avior and other Authors write, is very likea small and vulgar Lizard, except in their quantity, which is greater; their legs taller, and their tail longer. They are also thicker and fuller then a Lizard, having a pale white belly, and one part of their skinexceeding black, the other yellow like Verdigreafe, both of them very splendent and gliffering, with a black line going all along their back, having upon it many little spots like eyes : And from hence it comet b to be called a Stellion, or Animal stellarm, a creature full of stars, and the skin is rough and bald, especially upon the back where those spots are, out of which as writeth the Soblidit, iffueth a certain liquor or humor, which quencheth the heat of the fire when it is in the

This Salamander is also four-footed like a Lizard, and all the body over it is set with spots of black Manbiolus. and yellow, yet is the fight of it abominable and fearful to man. The head of it is great, and fometimes they have yellowish bellies and tails, and sometimes earthy. It is some squestion among the larned, whether there be any differetion of fex, as whether there be in this kinde a male and a female. they affirmeth that they never engender, and that there is not among them either male or female, no morethen there are among Eeles. But this thing is justly croffed, both by Bellonim and Agricola, for they affirm upon their own knowledge, that the Salamander engendereth her young ones in her belly like unto the Viper, but first conceiveth egs, and she bringeth forth forty and fifty at a time, which ate fully perfected in her womb, and are able to run or go to foon as ever they be littered : and

therefore there must be among them both male and female.

The Countries wherein are found Salamanders, are the Region about Trent; and in the Alpers, and an alpers, and an alpers, and alpers, and alpers, and alpers, and alpers, and alpers, a and sometime also in Germany. They most commonly stequent the coldest and moistest places, as in the shadow of Woods, in hedges neer Fountains and Rivers, and sometimes they are found among Corn and Thorns, and among Rocks. They are feldom seen except it be either in the Springtime, or against rain, and for this cause it is called Annual vernale, and Plaviolum, a Spring or rainy creature. And yes there were many of them found together in a hole neer unto the City Sneberg in Germany, in the month of February, for they love to live in flocks and troups

together, and at another time in November, a living Salamander was found in a Fountain. How beit. together, and at another time in treatment of his den or lodging place, it is held for an affured prefage of if at any time it be leen fortuge to be cold or frofty, then they keep home, and go not vifible

oroad.
Some do affirm that it is as cold as Ice, and that it therefore quencheth heat or fire like a piece of Some do amen that it is as cold as a see a Ice, which if it be true, then is the old randiophical washing the and fenfe, for there is not creatures are not and moift, being compared to creatures without life and fenfe, for there is not any dead or fenfelesse body that so quencheth fire as Ice doth. But the truth is, that the Salamander any dead or ienieteile body that to describe the satural heat, which being compared to Aris cold, and colder then any set petral years the venom of the Salamander is reckoned among Septicks, or corroding things.

Willichius.

Orus.

pticks, or corrouning times.

It naturally loveth milk, and therefore sometimes in the Woods or neer hedges, it sucketh a Cow that is laid, but afterwards that Cows udder or flock dryeth up, and never more yeeldeth any milk, It that is laid, but afterwards that cows under or from artyeth up and note yelleth any milk. It also greatly loveth the Honey-combe, and some Authors have affirmed, that they week appears after air or fresh breath, like the Chamaleon, yet they which have kept Salamanater in glassic mover according to them any such thing. They are slow of pace, and void ground very stage thing, and therefore it is justly tearmed a heavy and flothful Beaft.

But the greatest matter in the Salamander to be enquired after, is whether it can live and be nonrifhed by and in the fire, or whether it can passe through the fire without any harm, or quench and rines by and in the which opinions in the very relation and first hearing, do crosse one another, for how can that either be nourished or live in the fire, which quencheth the same being put into it? Arifotle that never faw a Salamander himself, but wrote thereof by hear-say, hath given some co-Arifolle that never law a Salamander miniter, but worder effe animalium que igne non abfandanter Sala. Iour to this opinion, because he writteth, Nonnulla corpora effe animalium que igne non abfandanter Sala. mandra documento est: que (ut aiuni) ignem inambulant eum extinguit. That is to say, the Salamander is an evidence, that the bodies of some creatures are not wasted or consumed in the fire, for see fome fay) it walketh in the fire and extinguisheth the same.

Now whether this beseemed so great a Philosopher, to write upon hear-say, who took unon him to gather all natural learning into his own Graunge or store-house, and out of the sametofur. nish both the present and all future ages, I leave it to the consideration of every indifferent Reader that shall peruse this story. I for mine own part, rather judge it to be lightnesse in him. to insert a matter of this consequence in the discourse of this Beaft, without either Authors, or ers perience gathered by himself. This one thing I marvail at, why the Egyptians, when they will erpresse or signifie a Man burnt, do in their Hieroglyphicks paint a Salamander, except either fire can burn a Salamander, or else contrary to all their custom, they demonstrate one contrary by

Nicander plainly affirmeth, that the Salamander doth without all harm paffe through the fite and the Scholiast addeth, that there are certain passages in the skin, out of which issueth a kinde of liquor that quencheth the fire: And he telleth a ftory of one Andreas, who did dip a piece of cloth in the bloud of a Salamander, and tryed afterward whether it would burn or not, but did not finde that it would burn, wherefore he put it upon his hand, and thrust that into the fire, and then allo be felt no manner of pain. And therefore the faid Nicander calleth this creature Ciporrbinon; because of a certain fat humor which iffueth out of it, quenching the fire, but I rather think that this fat humor maketh the skin to glifter, for if it were properly fat, it would rather kindle and increase the fire then quench or extinguish the same.

Suidas followeth the common received opinion, that the Salamander quencheth the fire, (although it be not bred of the fire as Krickets are) like Ice; and when the fire is fo quenched, it isin vain to blow or kindle the same again with any bellows, as they say have been tryed in the Porges of Smiths. And this also caused Serenus to write, Seu Salamandra potens, nullifq; obnoxia flamile: the potent Salamander is never hurt by flames. Seneca consenteth hereunto , and Zoroaftres : and fo great hath been the dotage about this opinion, that some have written that it ascendeth up to the fire neer the Moon, far above the reach of the Eagles or swiftest Fowls. Thus say they that write, and maintain the Salamanders abiding in the fire without harm. Now on the contrary, let mails her their opinions, which deny this natural operation in the Salamander.

Pliny affirmeth, that in his own experience he found that a Salamander was confumed in the fire, and not the fire by it, for he faith he burned one to powder, and used the same powder in medicines.

Sextus alfo denyeth that it quencheth the fire, and unto this opinion agreeth Disforder. Action writeth, that when it is first put into the fire, it divideth the flame, and paffeth through speedily without harm; but if it tarry long therein it is burned and confiymed, because the liquor or humidity thereof is wasted. And this is allo granted by Galen, Theophroftus, and Niphus. And Manhoulus affirmeth that he tryed the fame, and found that if burning coals were laid upon it, then it burned like unto any other raw flesh, but being cast into the fire, it burneth nor speedily.

Albertus writesth, that there were some which brought to him a certain thing which they called Wooll, and faid that it would not burn, but he found it not Lang, Wooll, but Lange, that is, and poury adharency of a thing which flyeth from the frokes of hammers upon hot burning fron, and being collected upon cloth, or cleaving to any part of the Forge, it there becometh in they like yellowith pale Wooll.

The faid Author affirmeth, that he took a Spider, and laid the same upon a hot burning Iron. where it continued unburned and unharmed without motion a great while, by reason of his thick skin and coldnesse, and unto another he suffered a little candle to be put, which instantly put it out. And for the same causes, that is to say, both the thicknesse of the skin, and cold constitution cometh it to passe, that a Salamander can live to long in the fire without burning or consuming to ashes: for indeed the skin thereof is lo hard, that it is gut or pierced with a knife with great difficulty; and for the force of the fire hath, broken the skin, then also iffueth forth a cold humor, which for hereof may most manifestly appear by his full and gross body, and also by this, that it is seldom thereof may not indicate a start of the deal, except it he against rainy weather; and yet as the egges of other Serpents being cast into a hop burning furnace, do for a feafon rest in the same unburned, and yet are afterward consumed, to is it with the Salamander.

There be some that have found a web out of the hair growing upon Salamanders, which can by Corduc. ho means be fet on fire, but this is very falfe, becaufe the Salamander hath no hair upon it at all. And this kinde of web rather cometh of a kinde of flax that Pliny writeth of, or rather of the Amianimflone, called the Aibest, which is found in Ciprus, whereof they used to make coverings for the Theaftone, cante the saft into a fire, feems to be forthwitff all in a flame, but being taken out again, it Dioforid.

thineth the more gloriously.

Some also do affirm, that such a piece of cloth or web, may be wrought out of the Salamanders skin. but Brafavolus denyeth both the vertue of the stone, and of the Salamanders hide or shell, for he faith he tryed the flone, and it would not be wrought into wooll or foun into thread, and when he cast the Salamanders thell or hide into the fire, it burned, and the mattery cold liquor thereof did almost flie into his face.

But some then will demand, where had Pope Alexander that coat, which could not be purged but by fire, which made it alway as white as Snow, or that map or net at Rome, wherein (it is faid) the Napkin of our Saviour Christ is preserved, which men say is not washed but in the fire, which thing was fent to a Bilhop of Rome for a prefent from the King of Tarrays. Unto whom I answer out of Paului Venetus as followeth. There is a Province in Tartaria called Chinchnitalas, wherein is a Mountain abounding with Mines of Steel and Copper; now in this Mountain there is a kinde of earth digged up, which yeeldeth a thred like the thred of Wooll. After the digging of it up they dry it in the Sun, and then beat it in a brazen mortar, afterward they spin, it and weave it, in the same manner that they spin and weave other woollen cloth. After it is made, they have no means to purge it from spots or from filthinesse, but to cast it into the fire for the space of an hour, and then it is taken forth again as white as any fnow.

There is also an Allum called Alumen Sciole, and it is the same which among the Ancients is called After families, out of which also is made cloth that cannot burn, by reason of a certain Oyl that it contameth or yeeldeth to refift the fire. So out of the ftone Pyritis found in Kifheba, there cometh Cardan out agreen liquor pressed with dead coals, and after that, no fire can burn that cloth. There are also certain Mantles in Bohemia, (as witnesseth Agricola) which could never be burned. And out of Magnesia a scaly stone in Boldecrana, they make tables, which cannot be clensed but by fire. It is also recorded, that the fore-named After famius, and pitch quenched in the juyce of Mallows or Mercurial, being anointed upon a mans hand, doth keep them from burning, or fense of extraordinary heat. So Albertus writeth of a stone which he calleth Iscullos, or Iscustos, which I take to be a kinde of the Aibelle or Amiantus. And this ftone is found (as the fame Author writeth) in the farthest parts

of Spain, neer the Straights and Hercules-pillars.

And this thing seemeth the lesse strange, because they which are anointed with Bird-lime, or else with Vinegar and the white of an egge, do not so quickly seel the strength of fire and heat, when they thrust their hands into the midit of it. It is also found, that the hearts of them that die Pliny. of the heart-burning difease, or essentially poyson, cannot be burned with fire. And therefore when Germanicus Cesar was dead, it being suspected that he was poysoned by Piso, they cast his heart into the fire and it would not burn, which thing was alleadged against him by Vitellius the Oratour. And one Aesculapius in an Epistle which he wrote to Octavian Augustus saith, that there is a poyson so extream cold, that it keepeth the heart of a man poysoned therewish from burning, and if it it look in the fire is mayor by a hard as those which is concepted it walled Fire burning, and if it lie long in the fire, it waxeth as hard as a frone, which to concreted is called Profiis, from the force of the fire, and from the matter whereof it confifteth it is called an humane stone. He alfo faith, that this is red in colour, mixed with some white, and is accounted precious, because both it maketh a man that weareth it to be a Conqueror, and also preserveth him from all manner of

When the Salamander is provoked, it casteth forth a white mattery liquor or humor, and it is an audacious and bold creature, standing to his adversary, and not flying the fight of a man, and so much the lesse, lif it perceive that a man prosecute and follow it, to harm and kill it. The biring of it is very exitial and deadly, and therefore the French men use this speech upon the biting of a Sa-

Si mordu t'a une apessade. Prene ton linceul & sa flassade.

Ælianus.

That is, if a Salamander bite you, then betake you to the coffin and winding theet. The Rhellers do ordinarily affirm, that when a man is bitten by a Salamander; he hath need of as many Physicians do ordinarily antitin, that which And Arnold faith, that it hath in it as many venoms and means of hurrant the Salamander hath spots. And Arnold faith, that it hath in it as many venoms and means of hurrant the salamander hath spots. as the Salathanuer nath spots. The salathan another. For when it once biteth and fasteneth teething, as it hath colours distinguished one from another. For when it once biteth and fasteneth teething, as it hath colours distinguished one from another. ing, as it bath colours distinguished of it leaves the teeth behinder and then there never can be any remedy, and therefore it must be suffered to hang upon the wound until it fall off, either willingly or wearied, or else compelled by the medicines that the wounded patient receiveth. For by this means wearied, or elie compelled by the medicines that to be remembred, that the Salamander doth not alway only is the patient kept alive: yet this is alway to be remembred, that the Salamander doth not alway only is the patient kept alive: yet this is a way bite, although provoked, for Gelner affirmeth, that he having two of them, could never by bearbite, although provoked, for Origin antineer, the street of any man bitten by beating make them open their mouths, nor that in all his life did he ever hear of any man bitten by them. ing make them open their indutions the difference of time, wherein their rage fleweth it felf And of this thing he not only gathered of place and region, for that they bit in some by biting, and when not, but and the three bitten, there followeth a vehement pain and fash Countries, and not in the cure whereof there must be taken a decoction of Frogs, and the broth must upon the place, for the cure wheter where you elfe other common remedies against the poylon prescribed in the Treatise following.

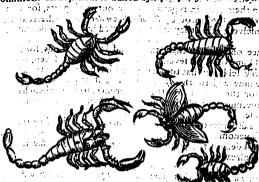

The poylon hereof is great, and not inferior to the poylon of any other Serpent, for some times by creeping upon Apple-trees, it infecteth and poyloneth all the fruit fo that those which ex times by creeping upon tappe. They know not whereof: and if the heel of a man do but touch any fmall part or portion of the spittle of a Salamander, it maketh all the hair of the body to fall off. The part of portion of the bold, as some have thought, but hot, like to the poyson of Cantharides, and therefore to be cured by the same means, as by vomits, Glysters, Ephemeron, and such like. Only Swine do eat Salamanders without harm or damage, for there is in them a kinde of re. fiftance in nature, and yet if Man or Dog do chance to eat of that Swine that hath eaten a Salamander, it hath been observed that they perished by the same. And this poyson spreadeth it fels the further when it is dead, because it is strengthened by putresaction, and Wine and Water wherein one of these lyeth dead, is empoysoned and made mortal thereby to others. But in our dave Salamanders are not so venomous, if there be any credit in Brasavolus, howbeit I have heard and read that if at this day a Salamander get into a heap of corn, the fo infecteth it, that whatfoever eateth of that corn, dyeth as it were of poyfon, and the Kine of Helvetia, which are sucked by Salamanders, do ever after remain barren, and without milk, and sometime also they die of that evil And as Arnolds writeth, it caffeth forth a certain mattery white humor like milk out of the mouth. whereupon if a man or any other living creature do but tread, he is poyfoned thereby, and at the leaft, all the hair of their body falleth off, and in like fort they infect herbs and plants of the carb by their poylon.

Sometimes it happeneth that beafts or men have swallowed Salamanders, and then the tongue is inflamed, and all the body falleth into grievous torment, by cold corruption and puttefiction, part after part, and also pains in the fundament and in the stomach, likewise Dropsies, and Impostumation in the belly, cramp of the guts, and retention of the urine. For the cure whereof they give fweet water. Calamints, Saint Johns Wort, fod with the fhells of Pine apples, leafs of Cyprelle, Galbanu, and Honey or Rozen, Ammoniack, and Stirax, New Cow-milk, the mest made of Flax-feed with sweet water, sweet Wine and Oyl to cause vomits: Scammony, and a decodion of Calamints and Figs, fat Bacon or Hogs-flesh, and also the Egges of a Tortoise, with the field thereof; besides infinite other remedies, ordained by the goodnesse of Almighty God, as Physitians know by their own studies and daily experiments. And therefore I hold it sufficient for me to have lightly touched them, referring those that are desirous to know more, unto the learned collection of Carromus.

Out of the Salamander it felf arife also some medicines, for it a hath a septick power to eate and corrode to take away hairs, and the powder thereof cureth corns and hardnesse in the feet. The hear tyed to the wrift in a black skin, taketh away a quartain Ague; and also Kirmiles writth, that being bound unto a womans thigh, it flayeth her monethly flowers, and keepeth her barren But this is worthily reproved for untruth, and therefore I will not commend it to the Reader. And thus much for the Salamander.

of the SCORPION.

Corplos in Greek is attributed both to the Scorpion of the Land and of the Sea, akhough fome-D times for difference fake, the Scorpion of the earth be called Scorpios cherfaior. The derivation is manifold according to fome Writers, either of Scorptzein ton ton , that is, difperling his poyfon, or of Schanos espein, because the motion of it is oblique, inconstant and uncertain, like as the same of fire beaten with a small winde. The Grecians also use for a Scorpius Res. because it casteth poyson, and Ottopos from the number of his eight feet. And in Exhibit there is a kinde of Scorpion which the Greeks call Sybrine. The Latines doe use indifferently Complete Control of the Control rently Scorpins, Surpio nepa, and Cancer also Vinula and Geptaria, as we finde in Poncies. The Arabians have many words, as Harab, Actob, Actorach, and Satoracon, Hasharab, Algerarat, Algererat, and Algerat and Alkatareti, for little Scorpions which draw their tails then. them. Howbeit, among these names also Algarat lignifieth that little kinde of Scorpions and Alearest the Scorpion with bunches on his back. The Hebrewes according to the opinion of fome, call a Scorpion Acchabim; the Italians, Scurtigicio, and Scorpione terreffe à the French, Da Scorpion : the Spesind Alacramand Alacram, which name they have also given to an Island in the Well-Indies subject to their dominion. In Castilia it is called Escorpion, and in Germany, Lin Scorpion.

The Countries which breed Scorpions, are these that follow, In Egypt, neer the City Copies, are very many great & pellilent Ringing Scorpions, who kill as foon as they fmite. Also Aibiepia and Numilla Varinai. abound with Scorpions, espe. Strabo. cially the later, wherein (as writeth Leo Afric) are every veer found very many that die of their wounds. Tenas one of the Cyclades Islands is called Ophiessa, because it yeelds many Serpents and Scorpions. Also in that part of Mauritania which is neer the West, are Scorpions with

wings and without wings : likewife in Iberia, Caria, and Lybia. And it is allo faid, that once there Elianus. were many Scorpions brought into India, into that part of the Country where the Relievebag! Leo Afric. dwell. By the way betwirt Sufir in Perfia and Media, there were wont to abound Scorpions under every flone and turf, for which cause, when the King of Perfig was wont to go into Media, he gave commandement unto his people to fcowr the way, by using all means to kill them, giving gifts to them that killed the greatest number of Scorpions. There is an ancient Town in Africk called Pef- Strabe. and wherein the abundance of Scorpions do fo much harm, that they drive away the inhabitants all the Summer-time every yeer untill November, following. And in like fort Diogorus declareth of many other places utterly for faken to avoyd the multitude of Scorpions, as namely, one part of Arabia, and the Region of India about Arrhetan, or the river Estuments, likewife neer the Chambles in Ethiopia. There is also a City called Alabands, standing betwigt two hills or mountains, like as a Cheft turned inward, which Apollonius calleth Cistam inversam Scoppionibus plenam; a Cheft turned inwardfulf of Scorpions. In an Island of Canaria also are many Scorpions, and those most pestilent, which the Turks gather as often as they may to make Oyl of Scorpions. In Italy, especially in the Cordu. Mount Teffacem in Rome, are also Scorpions, although not to hurtfull as in Africa, and other places, and it is thought that P/yll, whose nature cureth all kinde of venemous Serpents harms, did only for lucres sake bring Serpents and Scorpions into Italy, and there left, them, whereby they encrease to that number and multitude, which now we see them have. And thus much may fuffice to have spoken of the Countreys of Scorpions.

The kinder of Scorpions I finde alfo to be many, but generally they may be referred unto twain. whereof one is called the Scorpion of the earth, and the other the Scorpion of the water or of the Sea, whose discourse or history is to be found among the fishes, for we in this place doe only write of the Scorpion of the earth, which is also called by Avicen's wilde Scorpion. Of this kinde there are many differences. First they differ in sex, for there are males and females, and the semale is greater then the male, being also fat, having a groffer body, and a greater and tharper sting, but the male is more fierce then the female. Again, some of these have wings, and some are without wings. Gilla and some are in quantity greater then a Bean, as in Helvetia, neer Rapingli by Zurick. The Scorpions called Vinnie, are of a reddish colour, as it were Rose-water and Wine mixed together; and from thence it is probable that they took their name, and from their colour, the Authors bave observed severall kinndes.

The first is white, and the biting of this is not deadly.

The second is reddift, like fire flamant, and this when it hath wounded causeth thirst. The third is of a pale colour, and therefore called by the Grecians, Zophorides, and these when they have wounded a man cause him to live in continual motion and agitation of his body, so as becannot fland still, but remaineth distract and without wit, slway laughing, like a fool.

The fourth kinde is greenish, and therefore termed Chlores, which having wounded, causeth intolerable trembling, shaking, and quivering, and cold, so that if the patient be laid in the hot sun, yet hethinketh that he freezeth like hayl, or rather feeleth hayl to fall upon him.

The fifth kinde is blackish pale, and it is called Empelies, it hath a great belly and broad, whereof the poylon is great, and causeth after stinging and admirable heavinesse, and forrowfull spirit. Thiskinde is called by Gefner, Ventricosum, because of the large belly, by the Arabians, Algetarat, and by Ponzettu, Geptaria. It eateth herbs, and the bodies of men, and yet remaineth insatiable, it bath a bunch on the back, and a tayl longer then other Scorpions.

The fixth is like a Crab, and this is called by Blinnia Hamane Scorpion, it is of a great body and the tixth is tike a Crap, and this is called by rettained a namene sees point it is one great body, and hath tongs and takers very folid and firong, like the Granueless Orevita, and is therefore thought to take the beginning from that Fifth. have been the beginning from that Fifth the Honey-colour chereof, or rather waxe-colour. The leventh is called Mellichlotic, because of the Honey-colour chereof, or rather waxe-colour, and the wings it hath on the back, are like the wings of a Locust.

Ælianw. Pliny.

and the wings it hath on the back, are like the wings of a Locuit.

Allo Scorpions do differ among themselves in regard of their outward parts, for some of them have wings, as those in India, which are spoken of by Strabo, Alicander, and others, and therefore many times when they senter themselves to sive after a transported by the winde from one Countrey to another.

There is also another difference objected in their tayls, and in their stayls, are more hardy have like knots on their tayls, and some of them seven are more hardy and sierce, but this suffer out very seldonic that the Scorpions have seven, are more hardy and sierce, but this suffer out very seldonic that the Scorpions have seven, are more hardy and sierce, but this suffer on the very seldonic that the Scorpions have seven, are more hardy and sierce, but this suffer to have nine, as writeth. Apollodorus. For if any have seven; then is there therefore much seldonic to have nine, as writeth. Apollodorus. For if any have seven; then is there there is no seven as them having a single strain in the seven and some seven as the seven are more hardy and sierce, but this suffer to have nine, as writeth. Apollodorus. For if any have seven as suffered that the seven are more seven as the seven are more seven as the sev therefore much leidomer to have line, as written afform of them having a fingle, likewife in them a double fling, for there is also another difference, some of them having a fingle, and some a double sting, yea, sometimes a trebleone, and the sting of the male is more thick and strong then the sting of the semale.

Arifotle.

ong then the ting. or the leman difference in motion, for some of them hold up their tayls from And to conclude, there is all a senomous, others again draw them along upon the earth, a little the earth, and there are most deadly, and novionfull, some of them also sie from one Reginowled cogether, and these are most deadly, and novionfull, some of them also sie from one Reginowled cogether, and these are most deadly, and novionfull, some of them also sie from one Reginowled

on to another, as we have thewed already fer on to another, sawe nave inewed already main a more lively difference, then the confideration of Again, there is nothing that giveth a main a more lively difference, then the confideration of their poylon, for the Scorplons of Phalm and that part of the Alpes neer Norleum, do never harm their poylon, for the Scorplons of Phalm and that part of the Alpes neer Norleum, do never harm ener poyion, for the storploss of reaching the first of a shound, fo as they live under every sone any living Creature, and therefore are they suffered to abound, so as they live under every sone. In the fort in the Isle Sanguala, the Scorpions are like unto those that are in Cassilians, Spain, for In the fort in the life Sanguola, the Scorpions are nike unto those that he consisting pain, like the there the fing of the Scorpion doth not bring death, yet they cause a imarting pain, like the there the finging of a Wasp, differing herein, that the Scorpions linging is more pain that cometh by the flinging of a Wasp, for it tarrieth about aguarter of an latting, and continueth longer their the flinging of a Wasp, for some feel more; and some leser pain, hour, and by the Bitting thereof all are not pained alike, for some feel more; and some leser pain. Contrary to these are the Scorprofe of Postara in Afrik, who ever with their tails wound mortally, Contrary to these are the Scorprons of Fernal in Laples, who even with their tang woman mortally. And those in Scythia, which are great, and hurtfull unto men and beafts, killing Swins, who do not much care for any other Serpent, especially the black Swine, who do also die the sooner, it they drink immediately after the wound received. The like may be said of the Scorpions of Egyn. And this much for the different kindes of Scorpions; wherein nature produceth a notable variety, thus much for the different kindes of Scorpions; wherein nature produceth a notable variety, as may appear by all that hath been aid, Now it followeth that we likewife make fome relation

as may appear by all that hath occurrence into the conference of their congenity one with another.

They are all little living Greatures and much differing in proportion from the great scarabe or Horse-file, except in the fashion of cheir tails. Their back is broad, and flar, distinguished by certain knots or feams, fuch as may be feen in Sea-Crabs, yet their head different, and hath no refemblance with the Crab, because it is longer, and hangeth farre out from the body, the Countnance whereof is fawning, and Virgin-like, and all the colour a bright brown. Notwithlanding the fair face, it beareth a tharp fling in the tail, which tail is full of knots, wherewithall it prickethand hurteth that which it toucheth. And this Piny affirmeth to be proper to this Infect, to have a fling in the tayl and to have arms: For by arms he meaneth the two croffe forks of tonges which come from it on both fides, in the tops whereof are little things like pinfons, to detain and hold

fast, that which it appreliendeth, whiles it woundeth with the sting in the tayl.

It hath eight feet, four on the one fide, and four on the other, from whence, as we have thewed already, it is called Odopos. For the feet and arms thereof is very much like unto the Sea-crab, and therefore may not unfitly be called either the mother or the daughter thereof. They have also tongues, wherewithall they use often to lick and smooth over their own bodies. And seeing of all other things they love fresh and clean linnen, whereinto they infinuate, and wrap themselves when they can come unto it, then also first of all they cleanse their whole bodies all over with their tongues, and next to their flesh put on this clean linnen, as a man would put on a shirt.

As we have faid already it hath a tayl, wherein the fling thereof is placed, but what this flinging divers Authors are of divers opinions concerning the same, some affirming it to be hollow, others denying it, finding in it no passage at all to contain or convey poyson. Alianus again saith, that there must needs be in it a passage or cavity, although it be so small as by no means it can be perceived with the eyes of any mortall man, and in that sting is the poyson lesse visible, which when it striketh, disperseth it self instantly into the wound. But what should this poyson be? whether a substance of fpirituall humour; furely a substance, which although it be mole minima, yet facultat mexima, that is, of great power, although of small quantity. And therefore another Author (gamely Gerards) writeth hereof after this manner; Scorpius e centro quod gavum effe oreditur emittit bumitin ventrofun. That is to fay, The Scorpion out of a hollow center, fendeth forth a venemous humour. And of this venom we will afterwards discourse more at large. Thus much in this place may serve to make

Now then it followeth that we inquire about the manner of their breed or generation which find to be double, as divers Authors have observed one way is by putrefaction, and the other by laying of egges, and both these wayes are consonant to nature, for Lacinius writeth, that some creature are generated only by propagation of feed, such are men, Vipers, Whales, and the Palm-tree, some are general by purcelaction, as the loufe, flie, graffe, and fuch like imperfect things, and some both agues, as Mice, Scorpions, Emmets, Spiders, Purllain, which first of all were produced by putrefaction: and fince their generation are conserved by the feed and egges of their own kinde. Now thereon: and afterward by pro-

plin faith, that when Sea-crabs dye, and their bodies are dryed upon the earth, when the Sun entreth into Cancer and Scorpius, out of the putrefaction thereof arifeth a Scorpion; and fo out of the putrefied body of the Crevish burned, arise Scorpions, which caused Ovid thus to write :

> Concava littoreo fi demas brachia cancro. Cetera supponenterra, de parte sepulta Scorpius exibit caudaque minabitur unca. Obrutus exemptis Cancer tellure lacertie, Scorpius exiguo tempore factus erit. In English thus: If that the arms you take from Sea-crab-fish, And put the rest in earth till all consumed be. Out of the buried part a Scorpion will arife. With booked tayl doth threaten for to burt thee.

And therefore it is reported by Ælianus, that about Estamenus in India, there are abundance of Scorpions generated, only by corrupt rain-water standing in that place. Also out of the Basilisk beaten into pieces and fo putrefied, are Scorpions engendred. And when as one had planted the herb Bafilies on a wall, in the room or place thereof he found two Scorpions. And fome fay that if Ja. Lacinimi. a man chaw in his mouth fasting this herb Basill before he wash, and afterward lay the same abroad uncovered where no fun cometh at it for the space of seven nights, taking it in all the day time, he shall at length finde it transmuted into a Scorpion, with a tayl of seven knots.

Hollerim, to take away all scruple of this thing, writeth that in Italy in his dayes, there was a Kiremides man that had a Scorpion bred in his brain, by continual! fmelling to this herb Bafill, and Gefner by relation of an Apothecary in France, writeth likewife a flory of a young maid, who by fmelling to Buill fell into an exceeding head-ache, whereof the dyed without cure, and after her death being opened, there were found little Scorpions in her brain.

Arifielle remembreth an herb which he calleth Siffimbria, out of which putrefied Scorpions are engendred, as he writeth. And we have shewed already in the history of the Crocodile, that out of the Crocodiles egges do many times come Scorpions, which at their first egression do kill their Philes: Dam that hatched them, which caused Archelaus which wrote Epigrams of wonders unto Ptolemens. Elianus. to fing of Scorpions in this manner :

In vos diffolvit morte, & redigit Crocodilum Natura extindum, Scorpii omnipotens. Which may be Englished thus; To you by Scorpions death the omnipotent Ruines the Crocodil in natures life extint.

And thus much for the generation of Scorpions out of putrefaction. Now we will proceed to the second manner of their generation, which is by propagation of seed: for although Ponzettue make some question about their copulation, yet he himself inclineth to that opinion, as neerer untotruth, which attributeth carnall copulation unto them, and therefore he alledgeth the example of flies, which admit copulation although they engender not thereby. Wherefore we will take it for granted, that Scorpions lay egges after copulation, which hapneth both in the Spring and

And these are for the most part in number eleven, upon which they sit and hatch their young ous, and when once they are perfected within, those egges (which are in fight like the little worms out of which Spyders are engendred) then do they break their egges, and drive the young out. For as Isidorus writeth, otherwise the old should be destroyed of the young, even as are the Play: Crocodiles. Some again fav. that the old Scorpions do devour their young ones.

Being thus produced by generation, they live upon the earth, and those which are bred of the Sea-trab, do feed upon the foam of the Sea-water, and a continuall white mould or chalk neer the Sea. But the Scorpions of Ashiopin do eat all kinde of worms, flyes, and small Serpents. Yea those Serpents whose very dung being troden upon by man, bringeth exulcerations. And a tryali that corpions cat flies, was made by Wolphine at Monspeller, for having a young one in a boxe, for one whole moneth together it lived upon flies, and grew by the devouring of them bigger, being put inbthe Glasse unto him.

They live among tiles and bricks very willingly, and for this cause they abound in Rome in the called Teflacem. They are also in Bononie found in the walts of old houses, betwire the

Ælianu.

fittines and the morter. They love also clean clothes, as we have faid already, and yet they abborre all places whereon the Sun flimeth. And it feemeth that the Sun is utterly against their nature, for the fame Scorpton which Waphin had at Mongeller, lived in the Glaffe untill one day he fet it in the Sun, and then prefetitly after te dyad.

To conclude, they love hollow places of the earth neer gutters, and fometimes they creed into mens beds, where unawares they do much harm: and for this cause the Lybians, who among other Merions are molt of all croubled with Scorpions, do use to fer their beds far from any wall, and very high allo from the floor to keep the Scorpions from afcending up into them. And vet fearing all deviles should be too little to secure them against this evil, they also see the feet of their beds in vessels of water, that so the Scorpion may not attempt so much as to climbe up unto them for fear of drowning. And also for their further safeguard, they were socks and hose in their beds fo thick as the Scorpion cannot eafily fling through them.

And if the bed be so placed that they cannot get any hold thereof beneath, then they climbe up to the fieling, or cover of the house, and if there they finde any hold for their pinching legs to apprehend and fasten upon, then in their flatred to man-kinde, they use this policy to come unto him. First one of them (as I have said) taketh hold upon that place in the house or seling over the bed wherein they finde the man afleep, and so hangeth thereby, putting out and firetching his thing to hurt him, but finding it too fhort, and not being able to reach him, he sufferest another of his fellowes to come and hang as fast by him as he doth upon his hold, and so that secondgiveth the wound : and if that fecond be not able likewife, because of the distance, to come at the man, then they both admit a third to hang upon them, and fo a fourth upon the third, and a fifth upon the fourth, untill they have made themselves like a chain, to descend from the top to the bed wherein the man fleepeth, and the last firiketh him : after which firoke he first of all runneth away by the back of his fellow, and every one again in order, till all of them have withdrawn themselves.

By this may be collected the crafty disposition of this Scorpion, and the great subtilevand malice that it is endued withall in nature, and feeing they can thus accord together in harming a man. t argueth their great mutuali love and concord one with another, wherefore I camot but marvell at them who have written that the old ones destroy the young, all but one, which they set upon their own buttocks, that so the Dam may be secured from the sting and bitings of her son. For feeing they can thus hang upon one another, without harm, favouring their own kinde, I fee no stable but that nature hath grafted much more love betwire the old and the young ones, so as ndither the old do first destroy the young, nor afterward, that young one preserved in revenge of

his fellowes quarrell, killeth his Parencs.

It is reported by Arittotle, that there is a hill in Caria, wherein the Scorpions do hever fling any Arangers that lodge there, bur only the natural born people of that Countrey. And herunto Pliny and Allanus feem to fubleribe, when they write that Scorpiones extraneos leniter modere, that is, Seproitins bice ftrangers but gently. And hereby it may be collected, that they are also by nature very fagacious, and can difcern betwire nature and nature; yen the particular differences in one and the same nature. To conclude, Scorpions have no power to hurt where there is no bloud.

The naturall amity and enmity they observe with other creatures commeth now to be handled, and I finde that it wanteth not adversaries, nor it again hath no defect of poylon or maliceto make refistance and opposition, and to take vengeance on such as it meeteth withall. The principall of all other subjects of their hatred, are Virgins and Women, whom they do not only defire to harm, but also when they have harmed, are never persectly recovered. And this is at all times of the day, but unto men they are most dangerous in the morning fasting, before they have vented their poylon, and this is to be observed, that their tayls are never unprovided of slings, and

Afficient flore of venome to hart upon all occasions.

The Lyonis by the Scorpion put to flight wherefoever he feeth it, for he feareth it as the enemy of his life, and therefore writeth S. Ambrofe, Faiguo Scorpionie coulco exagitatur Les, the Lion is much moved at the small sting of a Scorpion. Scorpions do also destroy other Serpents, and are likewife destroyed by them. There was one Cellarius a Physitianin Padus, who put togetherinto due Viall, a Viper and a Scorpton, where they continually fought together, until they had like one another. The Swine of Soyibia, which do safely eat all other kinde of Serpents and venemous beafts, without all frarm, yet are destroyed by eating of Scorpions, and so great is the poylon of the Sibarite Scorpion, that the dung thereof being trode upon breedeth ulcers.

And as in this manner we fee the virulence, and naturall evill of Scorpions against other living creatures, to now we are to confider the terrors of the Scorpion, for God in nature bath likewife ordained some bodies, whereby the Scorpion should be, and is driven away, scared and destroyed

First of all therefore men, which are the chief, and head of all living Creatures, do by naturalinftinct, kill and deftroy Scorpions, and therefore Galen writeth thus, Let us (faith he) kill Scorpion, Spiders, and Vipers, not because they are evill in themselves, but because it is ingrafted in us by me ture, to love that which is good unto us, but to hate and avert from that which is evil unto us, Non confideramer genitum no the fir an fecus, not confidering whether it were fo bred or not. Aster have thewed their generation our of purrefaction to be by hear, fo also is their destruction by hear for they are not able to abide the heat of the Sun, and therefore, although they cannot live mold Northern Countreys, but in the hotter, yet in the hotter they choole madowes, boles of the enth, coverture of houses, and such like vile and obscure places, to secout and secure themselves in

h is also reported, that if Scorpions do ar any sime behold a Stellion, they fland amazed and Galin wonderfully aftonished. The Viper also having killed a Scorpion, becometh more venemous. and the Ibis of Egypt destroyeth Scotpions. There are a little kinde of Emmets, called by the Ardand the training, which are exters of Scorpious. The quick-fighted Hawks alfo, from whose piercing ere no Serpent can be hid, when the feeth a Scorpion, he neither feareth nor spareth it. It is also thought that Hares are never molested by Scorpions, because if a man or beast be anounted with the rennet of a Hare, there is no Scorpion or Spider that will hart him. Wilde Goats are also faid to live without fear of Scorpions, even as the African Pfilli of whom we have often Ipoken.

Now this vertue against Scorpions is not only in living things, but also in the Prants of the earth. and therefore Stflim writeth, that the feed of Nofe-wort burned or fcorched doth drive away Serpents, and refile Scorpions and to doth the root of the Mast-tree, and the feed of Violets, and the ime vertue is afcribed to the heeb Lychim, which is Englished Calves-frout, and also to the feed of

wilde Parfnip.

The smell of Garlick and wilde Mints set on fire, or strewed on the ground, and Dittany have the same operation; and above all other, one of these Scorpions burned, driveth away all his fel- Arnelden, lower which are within the Imell thereof, and therefore this is a most usuall thing in Afie and Africk. Actim. to perfume their houses with Scorpions burned, and in stead thereof they make as it were little oils of Galbanum fandaracha, with butter, and the fat of Goats, and thereof altogether make their perfume : alfo Bettony, and wilde Pellitory with Brimftone. They use alfo to cover pans with certain things called by them. Alkiran and Aja, and with these they compasse the place wherein the Palladius. Scorpion lodgeth, and then it is found that they can never fir any more from that place. And Rafie. some instead thereof, powr Oyl into their holes after them for the same effect. And the Husband-men of Meuritania doe tye and fasten to their bed-side, sprigs of white thorn, and Hasell- Strabo. nuts, wherewithall by a fecret antipathy in nature, they drive away and keep themselves safe in Pluterch. their beds from the annoyance of Scorpions.

By touching of Hentbane they lie dead and overcome, but if one touch them again with white Ellebore, they ravive, and are released from their former stupefaction. It is also faid that the leaves of water-mallowes do alfo aftonish Scorpions, and fo alfo doth the Radish-root. The Seacrab with Bafil in her mouth destroyeth the Scorpion, and fo doth Tunicle and Mushrom of trees. To conclude, the spittle of a manis death unto Scorpions; and therefore when a certain fellow took upon him to be a cunning Charmer, and by incantation to kill a Scorpion, he added to the words of his Charm is creble spitting in the mouth of the Serpent, and so it dyed : whereupon Webbie which was prefent, and faw this Charmer, di d afterward by himself alone at home, make Actius. triall of spittle without a Charm, and so found that it alone killeth Scorpions, especially the spittle of a man fasting, or very thirsty. Moreover, there be certain Lands wherein no Scorpions will live, as that about Clupes in Africk, and the dust of the Island Gaulus neer Cercina, being fprinkled upon a Scorpion, doth incontinently killit. And fo much also writeth Hermolaus, of the Region Galatha.

Thele and fuch like things are observed by our painfull and industrious Ancestors about the nature of Scorpions, as well that which is hurtfull unto them, and they are afraid of, as those to which they are enemies in nature, and wound mortally when they light upon them. It is remembred by Textor that Orimwas slain by a Scorpion, whereupon the Poets have made many tales. They say, that when he was grown to be a man he was a great hunter, and a continuall companion of Diana, who glorying much in his own strength, boasted that he was able to overcome any Serpent or other wild beast, whereat the Gods being angry, for revenge, and taking down the pride of this young man, caused the earth to bring forth a Scorpion, who killed Orion. Whereat Diana was very forry, and therefore in lamentation of her champion, and for the good deeds he had done unto her, translated him into heaven, close by the constellation of the Bull. Lucas on the other fide faith, that Diana fent this Scorpion to kill him, thrying his famous fuccess in hunting, and that afterward the Goddess taking pity on him, translated him into heaven. Others write again, that he had his eyes put out by Oenopion, and that he came blind into the Island Lamnus, where he received a horse of Vulcan, upon which he rode to the Sun-rising, in which journey, he recovered again his eye-fight, and so returning,, he first determined to take revenge upon Oempion for his former cruelty. Wherefore he came into Greet, and feeking Oempion, could not finde him; because the was hid in the earth by his Citizens, but at last coming to him, there came a Scorpion and killed him for his malice, rescuing Oenopion. These and such like fables ate there about the death of Otion, but all of them joyntly agree in this, that Orion was flain by a Scorpion. And fo faich Ambologim was one Panopam a Hunter.

There is a common adage, Cornin Scorpium, a Raven to a Scorpion, and it is used against them that perifi by their own inventions: when they fet upon others, they meet with their matches as a Ravendid when it preyed upon a Scorpion, thus described by Alcian, under his title Justa ulito,

juftrevenge, faying as followeth. Regiobat volucer captum pede corum in auras

Scorpion, audaci pramia parta gula. Aft ille infuso sensim per membra veneno,

Which may be Englished thus: The ravening Grow for prey a Scorpion took Within ber foot, and therewithall aloft did flie, But he impossion'd ber by force and finging frokes

Raptorem in flygias compulit ultor aquas. O rifu res dignal altis qui fata parabat. Ipse peritt, propriis succubuitque dolis.

So vavener in the Stygian Lake did die. (did kill O foortfull game I that he which other for beliges lake B) bis own decets flould fall into deaths will.

Ponzettes.

Albertus.

Ælianus.

Gyraldus.

Cardan.

There be some learned Writers, who have compared a Scorpion to an Epigram, or rather an Epigram to a Scorpion, because as the sting of the Scorpion lyth in the tayl, so the force and Epigram to a Scorpion, because as the long for vel agriter et false mordest, vel jucunde & dukiter delette, verque of an Epigram is in the conclusion, for vel agriter et sales mordest, vel jucunde & dukiter delette. vertue of an Epigram is in the conclusion, or elfe delight pleafingly. There be many wayer of that is, either let it bite sharply at the end, or elfe delight pleasingly. There be many wayer of that is, either let it bite interprise the bringing Scorpions out of their holes, and fo to destroy and take them, as we have already touched bringing Scorpions out of their notes, and that follow: A perfume made of Oxe-dung, also Storax in part, unto which I may aude that ten Water-crabs beaten with Bafil is an excellent perfume for and Arfenick. And Pliny writeth, that ten Water-crabs beaten with Bafil is an excellent perfume for and Arientek. And time with affect of Scorpions. And in Padua they use this art, with small sticks this purpose, and so is the anico of upon the frones and morter wherein they have their nefts. or traw they touch and make a mark or their meat, instantly leap out, and so them they thinking them to be some slies for their meat, instantly leap out, and so theman that then they thinking them to be some interest to lay hold upon them and that deluded them is ready with a pair of tongs or other infirument to lay hold upon them and take deluded them is ready with a kar many, and of them so taken, make Oyl of Scorpions. And Cont. them, by which means they take many hand of them, by which means they take them frantise writeth, that if a mans hand be well anounted with juice of Radish, he may take them without danger in his bare hand.

In the next place we are to proceed to the venom and poyfon of Scorpions, the inftrument of fling whereof, lyeth not only in the tail, but also in the teeth, for as Ponzetim writeth, Ledit for. pius morfu et idu, the Scorpion harmeth both with teeth and tail, that is, although the greatest harm do come by the sting in the tayl, yet is there also some that cometh by their biting. This poylon of Scorpions, (as Pliny out of Apolloderus writeth) is white, and in the heat of the day is very server. vent and plentifull, fo as at that time they are infatiably and unquenchably thirty, for not only the wilde or wood Scorpion, but also all other are of a hot nature, and the symptomes of their bitings are such as follow the effects of hot poylons: and therefore faith Rafir, all their remedies are of a cold quality. Yet Galen thinketh otherwise, and that the poylon is cold, and the effects thereof are also cold. For which cause Rondeletse prescribeth Oyl of Scorpions to expell the stone. and also the cure of the poyson is by strong Garlick and the best Wine, which are hot things. And therefore I conclude, that although Scorpions be most hot, yet is their poylon of acold nature.

In the next place, I think it is needfull to expresse the symptomes following the firiking or flinging of these venemous Scorpions, and they are (as Actim writeth) the very fame which follow the biting or poyson of that kinde of great Phalanse Spider, called also Teragnatum, and that is, they are in such case as those persons be which are smitten with the Falling sicknesse.

He which is stung by a Scorpion, thinketh that he is pressed with the fall of great and cold hayl, being fo cold, asif he were continually in a cold fweat, and fo in short spacethe povion difperfeth it felf within the skin, and runneth all over the body, never ceasing untill it cometo poffeffe fome predominant or principall vitall part, and then followeth death. For as the shinis small and thin, fo the fting pierceth to the bottom thereof, and fo into the flesh, where it woundeth and corrupteth either some vein, or arterie or finew, and so the member harmed swelleth immediately into an exceeding great bulk and quantity and aking, with infufferable corment. But yet (as we have already faid) there is a difference of the pain, according to the difference of the Scorpion that stingeth. If a man be stung in the lower part of his body, instantly followeth the extension of his virile member, and the swelling thereof: but if in the upper part, then is the person affected with cold, and the place smitten is as if it were burned, his countenance or face distorted, glewish spots about the eyes, and the tears viscous and slimy, hardnesse of the articles, falling down of the fundament, and a continual defire to egestion, foaming at the mouth, coughing, convulsions of the brain, and drawing the face backward, the hair stands upright, palenesse goeth over all the body, and a continual pricking like the pricking of needles.

Also, Gordomus writeth, that if the prick fall upon an artery, there followeth swouning, but if on a nerve, there speedily followeth putrefaction and rottennesse. And those Scorpions which have wings, make wounds with a compasse like a bow, whose succeeding symptomes are both heat and cold, and if they hurt about the canicular dayes, their wounds are very feldome recovered.

The Indian Scorpions cause death three moneths after their wounds. But most wonderfull is that which Strabo relateth of the Albenian Scorpions and Spiders, whereof he faith are two kindes, and one kinde killeth by laughing, the other by weeping. And if any Scorpion hurt a veininthe head, it causeth death by madnesse, as writeth Paracelsus. When an Oxe or other beast is strucken with a Scorpion, his knees are drawn together, and he halteth, refusing meat; out of his note floweth a green humour, and when he is laid, he careth not for rifing again-

These and such like are the symptomes that follow the bitings and stingings of Scorpions, for the cure whereof I will remit the Reader to that excellent discourse written by Wohlen, wherein are largely and learnedly expressed, whatsoever Art could collect out of nature. And seeing we in our Countrey are free from Scorpions, and therefore shall have ino need to fear their poylon, it shall not I trust offend my Reader, if I cut off the relation of Scorpions cures, as a thing which cannot benefit either the English Reader, or else much adorn this History, and so I will proceed to the medicines drawn out of Scorpions.

The application or use of Scorpions in medicine, is either by powder or by Oyl, or by applying them bruifed to their own wounds, wherefore every one of these are to be handled particularly and first of all for the powder, it is made by ustion or burning in this manner. They take ten sorpions and put them alive into a new earthen pot, whose mouth is to be dammed up with loan or such like stuffe, then must it be set upon a fire of Vine-tree-shreds, and therein must the pot fand day and night untill all within it be confumed to powder, and you shall know by their white colour when they be enough; otherwise, if they be brown or burned, they must be continued longer. and the use of this powder is to expell the stone.

Again, they use to make this powder another way, they take twenty Scorpions, and put them Again, they use to make this powder another way, they take twenty ocorpions, and put them in a little earthen pot with a narrow mouth, which mouth must be stopped, and then the pot put into a Furnace by the space of fix hours, which furnace must also be kept-close wiehin, and with a gentle fire: then after fix hours take off the pot; and bruise the Scorpions into powder, and keep that powder for the use aforesaid. There are other wayes also to prepare this powder, but in all preparations the attendant and amistant must take heed of the sume or smooth that conjects from it, for that is very venemous and contagious.

But besides, there are many things to be observed herein, as first, that the Scorpions be alive. and that they be killed in Oyl, then that they be put in whole, with every member, without mutilation, and that the Scorpions appointed for this confection, be of the strongest poylon, and the time of their collection to be when the Sun is in Leo, and not in Scorpius, as some without reason

The Oyl fo made, is distinguished into two kindes, one simple, and the other compound. The simple is made of a convenient number of Scorpions, (as it were twenty if they be great, and more simple is made or a convenient manner of scorpions, (as it were twenty it they be great, and more if they be little) and they being pur into a glaffe yelfel, Oyl of bitter-Almonds must be powred upon them, and so the yelfelytopped close and fer in the Sun by the space of thirty dayes, and then shrived and used. Yet the women of Ferrara use Oyl-olive in stead of Oyl of bitter Almonds, and all Brafavolus. to observe no quantity of Oyl, but fill the pot full, and likewise no order in the number of the Scorpions, putting one to day and another to morrow, and so more the next week or moneth, as

The compound oyl is thus made, they take round Aftrologe, Cypresse, and Gentian, the roots of Capars, and upon these they pour Oyl of bitter Almonds, and toak the roots in the Oyl in the hor fun for the space of twenty dayes, then take they a complete number of Scorpions, from betwirtten to fifteen, these they put again to the Oyl, and so ftop up the mouth again, and set it the second time in the sun thirty dayes, and afterward ftrain to and use it. This compound-Oyl is not fo much approved by Brajavolus, as the former simple, because the first harli more Scorpions, and the second is stuffed or seasoned with spices.

The green Scorpion which is bred of Bafill, having feven knots in the tayl, being beaten and Kirmider. pounded with the herb Scorpion, and fo made into pills, then dryed and put into a glaffe, are yery, profitable to him that hath the Falling ficknesse, if he take of them three every instraing falling. in temperate Wine, but these being given to a sound man putteth him clean out of his wits. If a man takes vulgar Scorpion and drown the same in a porringer of Oyl in the wane of the Moon. and therewithall afterward anount the back from the shoulders to the hips, and also the head and forehead, with the tips of the fingers and toes of one that is a demoniack or a lunatick person, it is reported, that he shall ease and cure him in short time. And the like is reported of the Scorpions sling joyned with the top of Basil wherein is seed, and with the heart of a Swallow, all included in a piece of Harts skin.

The Oyl of Scorpions made of common Oyl-olive, is good for the pain in the ears infufed by dillation; alfo it cureth a Pleuriffe in this manner. They take meal out of a Windmill, and make thereof with water, pifte, or little cakes, in quantity like a Frind Crown, thefe muft be fod in a Alexim. frying panin Oyl of Scorpions, and to applyed as hot as can be to the place where the pricking is, and to kept to the fame very hot, and when it beginneth to be cold, let new be applyed ftill, nine times together, fucceflively one time after another. Scorpions bruifed! in new fweet Wine, doccure the Kings-evil. The aftes of a Scorpion infused by the yard into the bladder, breaketh and differ feth both the stone of the bjadder and the reyns. And the like operation hath a vulgar Galenus. Scorpion eaten with vinegar and Rofe cakes applyed to the gowty members, it many times eafeth

the inflaming pains thereof.

The Oyl of Scorpions is very available in the time of Plague, both by Oyntment and also in potion: wherewithall one did affirm to Wohlim that he gained a great fumme of money, which he prepared in this manner. He took a hundred Scorpions, and fod them in the oldest Oyl olive he prepared in this manner. He took a thindred Scorpions, and lod, them in the oldest Oyl-olive he could get, untill such time as the Scorpions were consumed, then did he shain them through a linnen sloth, adding unto it an ounce of Rubbirb, and so shitting it close in a glasse battle, he set it fortydayes together in the sun, and afterward he gave of it to be used in time of infection, advising them that had it to apply it in owntiment to the pulle, heart, hinder part of the head, neck and nothis. And if a man began to be fick; within twelve thours after the first sense of his pain, he was annoyned herewith about the timour, and then was it launced. This oyntment is also commended against all manners of the state of which is such as some mended against all manners of the state of the head. Second were more heasts, but also of mended against all manner of paysoil, not onely of other Serpents and venemous beasts, but also of the Scorpion it felf. And thus much for the history of the Scorpion. strayment for the intertaint of the acorbion.

of respect to a local plane to advertise to the local local local local local local local parts of the local local

Ælianus.

His Serpent called by the Gregians Soptale, is likewise termed by the Latinists, Senalis and he fome Scicalia, Picalis, Sciscetalis, and Seyseculus, and by Albertus, Situla, which we have already interpreted a Diplas, but all of them are most manifestly corrupted from Septale, the first Greeten word. And therefore I will not fland to confute them that call it also Cacilia, a blinde worm, beworg. And the sanner of other Serpents) it eateth no Fennell, but this Gaeilla or blinde Worm, cause (arter the maintet of better to be our English Slow-worm. This Saytall is very full of marker we shall afterward demonstrate to be our English Slow-worm. thors upon the back, to variable and delectable, that it possesset the beholders with admiration. and almost bringern them asleep looking thereon; for it is also flow, and moveth softly, wherefore it cannot purity where it would do harm, in fread therefore of celerity, thele naturall foot doe hold them that it doth defire to harm, like as they were stupefied and astonished. And in this brightneffe of the scales, first of all it must lay aside the winter-skin, or else there appeareth not any folmdopr at all. And it is alfo faid to be fo hot and fervide, that it cafteth skin in the Winter, according to this faying of Lucan

Et Soytale Sparfis etiam nunc fola pruinie

Enuvir positura suas.

That is in English thus: None but the Scytall while Winter-frosts abide. Out of bis sported skin and Saalas doth glide.

The outward form or visible proportion of this Serpent, is like that which we have already called a Double-head, and the Latines, Amphibens, except that the tayl hereof is flatter and thicker. The length of this Serpent is like the longest Worms of the earth, and the thickness like the helre or liangle of a loade. And the greatest difference betweet this and the Double-head, is that this goat bit one way, and the Double-head goeth as well one way as another: and the colour herof is like the colour of the other. The generall description of this Serpent is thus expressed by Mender;

Bifronti Smilem reperia Scytalam, Amphibena Pinquior eft tamen, & cauda, que nulla fere exit, Craffior ut quantum folita est comprendere lignum, Aquin an yaningi poine et comprentere uguar Curla manu firidum quoties tenet ipfa ligonem, Tam protica, vagans plunio quam restile caele, Buod facunda genis fue gignic vi foere telus. Neo postquam fuitinio vententi tempore versi, Magna Deum quando grafers ferpentia mater,

Liquerit observam consusta cubila peram. Et nitidos tepido fub fole extriverit arte, Pundentin fo faniculi teneram exedit berban, Sad per opaca morane imi declivia mentie Se tenet, & multo graviter latet obruta simm, Eque alta fua conquinit fibi pabula terra! Nec liget id megno qupiat, findeatque labere Arefcente, filim posis eft depellere faus.

il) 3263 634

Which may be Englished thus The Scylall like the Double-bead then Shalt in feature Studes
Tet is it salter, and tay! that beild no end much thicker is.
"As big as crooked hand is wonted for to winde As big as crooked hand is wonted for to winde
The haft and belve, of digging spake the earth that rifes.
As long is in an that thin crawling women which beavene rain.
Degets on fusifully carth, when howels wasness maybened eras.
And when the Mather-goddelf great leads fatth her, creeping train,
Which is Teers-youth, fresh time of Spring, both calm and fate.
Then leaves it all his wonted bed in rack observed and share and
And in what lin he stretches out, his limbs and share and
Eating the new spring blades of Remailshard, so putting teeth in ure,
In holes, of the declining bills in keeps, both great and smalls.
Where the indeposit sleep of buried nature it doth passes. Today on get out More the indeers for some passes of the pass

The biting of this Serpent is like the biting of the Double-head, and therefore the curting the same manner, wherefore I shall not need to repeat the signs thereof, or the cure in this place. And so I will conclude the story of this Serpent.

of the SEA-SERPENTS.

Mong the manifold kinds of Sea-serpents, as well known as unknown, (whereof some are like Athe Lamprey, some like the Myrm, and many other like the Serpents of the earth, except in their head, as Ariffoile writeth, for that is more like the head of a Conger then a Serpent) it pemiarly hath one kinde, in colour and form not unlike an Bel, in length about three cubits, in the gills and finnes refembling a Conger, but it hath a longer fnout or beak, which is also fortified the grin and with very many small sharp teeth, the eyes not so great, a smooth or pield skin, and hanging over at the back, having no scales, so as it may easily be fleyed. The belly of it is betwixt red and white, and all the body over is fet with spires, so as being alive it is not handled without danger. And this is by Pliny called the Dragon of the Sea, which cometh out of the Sea into the finds, and therein with an admirable celerity and dexterity maketh his lodging place. For the front thereof is sharper then the Serpents of the earth, therefore therewith it diggeth and hideth ifelf in the hole or hollow place which it hath made. This is also called by Pliny Ophidion, but I think it better to follow Aristotle, who doth call it Ophia thalattios, a Sea-serpent, the colour whereof ichlacker or dimmer then the Conger.

There be also Vipers of the Sea, which are in shew little fishes, about a cubit long, having a litthe horn in their forehead, the hiting or fting whereof is very deadly, and therefore when the Ether-men have taken any one of these, they instantly cut off the head and bury it in the fand. but the body they eat for good meat : yet these Serpents are thought to be none other then the Fiftes called Aganci, or Spider-fifthes, faving that they are faid to have a sharp sting in their head. & this a horn, for all Water or Sea-serpents have harder and less heads then the Serpents of the land.

In the Germane. Ocean there is found a Serpent about the bignesse of a mans leg, which in the ravicarryetha sting as hard as any horn, this haunteth only the deepest part of the Sea, yet is it sometime taken by the Fisher-men, and then they cut off the tail, and eat the residue of the body. Yet I will not exprelly define whether this may be called a Sea-Serpent, or a Serpentine-fifth; it may be it is the same that is a Fork-fish, or Ray, which by reason of the tayl thereof, it might give occasion to Albertus to call it a Serpent of the Sea.

There be also Snakes or Hyders in the Sea, for although all Water-ferpents, as well of the fresh, falt and fweet waters may be called Hiders, or Snakes, yet there be some peculiar Snakes, such Ællanus, are those in the Indian Sea, where they have broad tayls, and they harm more by biting with the fharpneffe of their teeth, then by any venom that is contained in them; and therefore in this they somewhat resemble the Snakes of the earth. And Pliny writeth, that once before Persis, upon the coalts of certain Illands, there were feen of thefe Sea-hyders very many, of the length of twenty Solinus. cubits, wherewithall a whole Navy or fleet of thips were mightily affrighted. And the like is reported of three other Islands, lying betwixt the promontory of Carmania and Arabia; and fuch were those also in the African Sea, who are said by Aristotle not to be asraid of a Gally, but will set upon the men therein, and over-turn it. And he himself saw many bones of great wilde Oxen.who had been destroyed by these kinde of Sea-snakes or Hyders.

The greatest River that falleth into the red Sea, is called Sintbm, the fall whereof afar off, feemeth to the beholders to be like winding Snakes, as though they were coming against the passengers, to flay them from entrance into that Land; and there is not only a fight or resemblance of Serpents there, but also the very truth of them, for all the Sea-men know when they are upon these coasts, by the multitude of Serpents that meet them. And so do the Serpents called Grae about Pufis. And the Coast of Barace hath the same noysome premonstration, by occurrence of many odious, black, and very great Sea-serpents. But about Barygaza they are lesse, and of yellow earthy colour; their eyes bloody, or fiery red. and their heads like Dragons. Keranides writeth of a Sea-Dragon, in this manner, faying? The Dragon of the Sea is a fish without scales, and when this is grown to a great and large proportion, whereby it doth great harm to other creatures, the winds or clouds take him up suddenly into the air, and there by violent agitation, shake his body to piecess the parcels whereof fo mangled & torn afunder have been often found in the tops of the Mountains. And if this be true (as it may well be) I cannot tell whether there be in the world a more noble part of Divine providence, and fign of the love of God to his creatures, who armeth the clouds of heavento take vengeance of their destroyers. The tongue of this Sea, Dragon (faith he) is like a Horses tayl, two foot in length, the which tongue preserved in Oyl, and carried about by a man, faleguardeth him from languishing in firmities, and the fat thereof, with the herb Dragon annoynted on the head or fick parts, cureth the head-ache, and driveth away the Leprofie, and all kinde of scabsin the skin.

Here is also the picture of another Sea-serpent, very like to the Serpent of the earth, being three or four cubits long, having a rounder belly then an Bel, but a head like a Conger, and the upper chap is longer, and standeth out further then the nether chap; the teeth grow therein as they do in Lam- Rondoletim. preys, but they are not fo thick, and it hath two small finnes neer the gills like an Eel. The colour of it is yellow, but the beak and belly is of Ash-colour, the eyes yellow, and in all the inward parts it doth not differ from a Lamprey, and there is no man of any understanding, (as writeth Rondehim) but at the very first fight, will judge the same to be a Serpent although the fiesh thereof

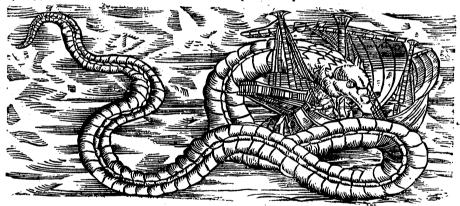

be no more harmfull then the Conger or Lamprey; yet for similitude with other Serpents, I could not chuse but expresse the same in this place;

There be also in the Swevian Ocean or Baltbick sea, Serpents of thirty or forty foot in length, whose picture is thus described, as it was taken by Olaw Magnus, and he further writeth, that these do never harm any man untill they be provoked.

The same Author also expresses likewise the figure of another Serpent, of a hundred and twenty footlong, appearing now and then upon the coasts of Norway, very dangerous and hurtfull to the Sea-men in calms and still weather, for they lift up themselves above the hatches, and suddenly catch a man in their mouths, and so draw him into the Sea out of the Ship: and many times they overthrow in the waters a laden Vessel of great quality, with all the wares therein contained. And sometimes also they set up such a spire above the water, that a Boat or little Bark without says may passe through the same. And thus much for the Sea-serpents.

of the SEPS or SEPEDON.

A Lthough I am not ignorant that there be some which make two kindes of these Serpents, because of the two names rehearsed in the title, yet when they have laboured to describe them severally, they can bring nothing or very little wherein their story doth not agree, so as to make twain of them, or to handle them as under, were but to take occasion to tautologize, or to speak one thing twice. Wherefore Gesser wisely pondering both parts, and after him Garronus, deliver their opinions, that both these names do shew but one Serpent, yet according to their manner, they expressed the truth out of their labours, wherefore I will follow their opinion, and not their example. Sepedon and Seps cometh of Sepsin, because it rotteth the body that it biteth: in colour it netily resembleth the Hæmorrhe, yet it usually goeth by spires and hals-hoops, sor which cause as it goeth, the quantity cannot be well discerned, the pace of it being much swifter then the Hæmorrhe. The wound that it giveth is smarting, entring deep and bringing putresaction, for by an inexplicable celerity, the poyson passeth over all the body, the hair rotteth and falleth from all parts, darknesse and dimnesse is in the eyes, and spots upon the body, like as if a man had been burned in the Sun. And this Serpent is thus described unto us by Nicander;

Ut the Sea Secrepts,

Tam que Sepedonis species sit, qualeque corpus Accipe : diversa tradum ratione figurat. Quin etiam mutila nulla infunt cornua fronti, Et color, birfati qualem eft fectare tapetie, Grande caput, brevior dum currit, cauda videtur: Quam tamen obliquo majorem tramite ducit. Quam tagtet could be magnos nocuosque dolores

Quod fit ab hoc vuln be, magnos nocuosque dolores

Which may be Englished thus;

Excitat, interimens quia, fundit & ipfe venenan Quo fata marcentes tabes depascieur artu. Indeque ficcata refolutus pelle capillus Spargitur, & volitans candentis pappus achante. Praterea fadum turpi vitiligine corpus. Et veluti, urenti maculas à fole videre eff.

Sepedons shape now take, and what bis form of body is, It doth not go as Hamorrhe doth, but traileth diverfly. His powled head of Hamorrhs borns full happily doth mife, And colours are as manifold as works of Tapestry : Great is his head, but running feems the tail but small Which winding, it in greater path draws after to and fro, But where it wounds, by pains and torments great it doth appall, Killing the wounded, infusing poyson so. Whereby confumed are the lean and flender finews, And dryed skin lets bair fall off apace, Like as the windes drive whiles from top of thifile Cardus, Besides the body filth, as with Sun parched, loofeth grace.

Thus doth Nicander describe the Sepedon: now also we will likewise relate that which another Poet faith of the Seps, that both compared together, may appear but one, therefore thus writeth Lucan, upon occasion of one Sabellin wounded by this Serpent.

-Miserique in crure Sabelli Seps stetit exiguus, quem flexo dente tenacem Auulfitque manu, piloque affixit arenis. Parva modò Serpens, sed qua non ulla cruenva Tantum mortis babet : nam plaga proxima circum Fugit rapta cutis, pallentiaque offa retexit. Famque finu laxo nudum est fine corpore vulnus : Membra natant fanie, Jura fluxere, fine ullo Tegmine poples erat : femorum quoq ; musculus omnis Liquitur : & nigra distillant inguina tabe. Diffiluit fringens uterum membrana, fluuntaue Viscera, nec quantum toto de corpore dibet, Effluit in terras favum, fed membra venenum Decoquit : in minimum mors contrabit omnia virus.

Vincula nervorum. & laterum textura, cavumque Pelius & abstrusum fibrie vitalibus omne, Quicquid bumo est aperit pestin : natura profana Morte patet : manant humeri, fortefq; lacerti: Colla caput q: fluunt , callido non osyus Austro Nix resoluta cadit, nec folem cera sequetur. Parva loquor, corpus fanie stillaffe peruftum: Hoc & flamma potest, sed quis rogus abfiulit ofa, Hec quoque discedunt, putresq: secuta medulin Nulla manere sinunt rapidi vestigia fati. Cyniphias inter peftes tibi palma nocendi eft: Eripiunt omnes animam, tu fola cadaver. Mole brevis seps, peste ingens, nec viscera solum, Sed simul offa vorans tabificus Seps.

Which is to be Englished thus; On wretched Sabels leg a little Seps bung fast, Which with his hand from hold of teeth heplucks away From wounded place, and on a pile the Serpent all agast He flaked in fands, to him O woful wretched day, To kill this Serpent is but small, yet none more power balb, For after wound falls off the skin, and bones appear full bare, As in an open bosome, the heart whole body gnaweth, Then all his members (fram in filth : corruption did prepare To make his shanks fall off, uncovered were knee-bones, And every muscle of his thigh resolved, no more did hold, His secrets black to look upon, distilled all Consumptions, The rim of belly brake out sierce, which bewels did insold, Out fell his guts on earth, and all that corps contain, The raging venom still beating members all, So death contracted all by little poyfons main, Unloofing nerves, and making fides on ground to fall: This plague the hollow breast and every vital part Abstrused, where the fibres keep the life in ure, Did open unto death: The life, the lungs, the heart. O death profane, and enemy unto nature. Out flow the shoulders great, and arm-blades strong, Both neck and head gush out in matter, all doth run. No fnow doth melt fo foon the Southern blast among, Nor wax fo fast diffolve by beat of shining Sun. Thefe things which now I freak I de account but small, That corps should run with filthy core, may caused be by flame sh

Tet bones are spared in fire, bere all away they falls Of them and marrow sweet, fate, lets me figuremain.

Among the Cycliph plagues, this fill shall hear the hell,

The south they take, this soul and eacheste hold,

The Seps, though sport the, in special a hell, Devouring bones, the body all undoth.

Thus you hear that more largely expressed by Lucan of the Seps, which was more briefly touched by Nicander of the Sepedon, and all cometh to one end, that both kill by putrefaction. The length of this Serpent is about two cubits, being thick toward the head, but thin and flender toward the tail. The head thereof is broad, and the mouth tharp, it is of many colours, so as some have thought that it could change colour like a Chamæleon. The four under teeth are hollow, and in them lveth the poylon, which are covered over with a little skin.

Paulanias affirmeth that he himself saw one of them, and that Egyptus the son of Elatus, a King of Artadia was slain by one of these. They live in Rocks, in hollow places of the Valleys, and under

fiones, and they fear no Winter, acording to this verse of Pictorius.

Hic byemis calidus frigora nulla timet. Which may be Englished thus; Of Winters cold it bath no fear. For warm it is throughout the year.

First of all after the wound appeareth fome bloud, but that symptom lasteth not long, for by and by followeth matter smelling very strong, swelling tumor, and languishing pain, and all the parts of the body affected herewith become white, and when the hair falleth off, the patient feldom liveth above three or four days after. The cure hereof is by the same means that the poylon of the Viper. the Ammodyte and Horned-serpent is cured withal. And particularly Active prescribeth a spunge Active wet inwarm Vinegar to be applyed to the wound, or elfe to lay the affice of chaffe with the earth upon which they are burned, to the place, and to anoint it with Butter and Honey, or elfe lay unto it Millet and Honey, likewise Bay-sprigs, Oxymel, Purslain, and in their dyet falt fish.

Ariffule writeth of a little Serpent, which by fome are called a facred and holy Serpent, and he faith that all other Serpents do avoid it, and flie from it, because what soever is hitten by it, presently routeth. It is in length (as he faith) a cubit, and it is rough all over, and therefore I take this Serpent to be a kinde of Sepedon. Also Arifforenus faith, that he knew a man by touching this Serpent to die, and afterward that the garment which he wore at the time of the touching of the Serpent, did likewife rot away. And thus much for the Seps and Sepedon.

of the SLOW-WORM.

His Serpent was called in ancient time among the Greciens Tythlops and Typhlynes, and Cophia, because of the dimnesse of the fight thereof, and the deafnesse of the ears and hearing, and vulgarly at this day it is called in Greece . Tepbloti . Tefliti . and Tepblini, and from hence the Latines have taken their word, Cecilia que: cecus Serpens, a blinde Serpent, and it is also called Cerula, Cecula, and Ceriella, as witnesseth Albertus, because the eyes thereof are

noneat all, or very small. The Italians call it Bifa orbala; and the Florentines, Lucignola; the Germans, Scaliger. Bhndenselycher; the Helvetians, En vieux, al' annoilx, and the people of Narbon, Nadels.

It being most evident that it receiveth name from the blindenesse and deafnesse thereof, for I have often proved, that it neither heareth nor feeth here in England, or at the most it feeth no better then a Mole. The teeth are fastned in the mouth, like the teeth of a Chamæleon, the skin is very thick, and therefore when the skin is broken by a hard blow, the whole body doth also break and park alunder. The colour is a pale blew, or sky-colour, with some blackish spots, intermixed at the sides. There is some question whether it hath one or two rims on the belly, for seeing they conceive their young ones in their womb, they have such a belly by nature, as may be distended and stretched out accordingly as the young ones grow in their womb. It hath a smooth skin without all scales. The neither eye-lid covereth all the eye it hath, which is very small: about the head they are more 3th coloured, then about the other parts of the body: The tongue is cloven, and the top thereof tery black. They are in length about a span, and as thick as a mans finger, except toward the tail

Osmaldus.

Of the Snake.

which is more slender, and the female is more black then the male. The passage or place of excrewhich is more nemare, and the temate is most skilled with the young in their belly, the little ones will ments or conception is transverse. If they be killed with the young in their belly, the little ones will ments or conception is trainverse. At they bearing what the young interest metter ones will instantly creep out at their dams mouth, and sometimes (as witnesset Bellonius) in this little Serpent are found forty little young ones. They are in Greece and England, and come not abroad till pent are found forty little young ones. pent are sound sorty sittle young ones. They are in orsee and any art in the abroad till July, and they go into the earth in August, and so abide abroad all harvest, and they love to hide themselves in Corn-fields under the ripe corn when it is cut down. It is harmlesse except being provoked, yet many times when an Ox or a Cow lyeth down in the pasture, if it chance to lie upon voked, yet many times when an oab to a Beaft, and if remedy be not had, there followeth mortality one of these Slow-worms, it biteth the Beaft, and if remedy be not had, there followeth mortality or death, for the poyson thereof is very strong. If it well, it is good to prick the place with a or death, for the poylon thereof is very attende. It is a Triacle made of the brazen bodkin, and then apply unto it Fullers-earth and Vinegar. There is a Triacle made of the brazen bookin, and then apply shade with this fome men are cured of the Plague. And thus Slow-worm, which smelleth like Aqua-vita; with this some men are cured of the Plague. And thus much of this little Serpent.

of the SNAKE.

Here is no reasonable learned man that maketh question, that Anguis in Latine is a general word for all kinde of Snakes and Serpents, and therefore when Virgil writeth of the fury Alette, how the cast a Snake into the bosome of Austa, he first of all calleth it Anguir, a Snake, and presently after Coluber & Vipera, a Serpent, as appeareth by these verses following. Eneid. 7.

Huic dea cœruleis unum de crinibus anguem Conjicit, ing; sinum pracordia ad intima subdit : Vipeream inspirans animam, fit tortile collo Aurum ingens Coluber . -

Which may be Englished thus: To her the Goddesse a Snake made of the Gorgons hair, Which to the bottom of ber breaft and entrails made to flide. Inspiring to her a Vipers soul though she were fair, For chain of gold an Adder bout ber neck did glide.

And this is the leffe to be admired or doubted, feeing the very word Anguis feemeth to be derived of Angulosus, winding or turning, for every kinde of Serpent may be folded or winded up together almost in every fashion. Yet sometimes, as the Grecians use Ophis for one kinde, as Hemiste or Her for Asp, so also is the word Anguis used for one kinde, which we call a Snake, that is, a little Serpent living both in the water and on the earth. Howbeit, as we shall shew afterward, when it is in the water it is cailed Hydrus and Na:rix, and when it is on the land, it is called Cherfydrus.

Among the ancient Pagans, Snakes were accounted the gods of the Woods, and this caused furfins to write this verse following;

Pingite duos angues, pueri, facer est locus.

That is, O ye children, draw the figure of two Snakes, for this place, (meaning the grove of Wood) is a holy place, and facred to the Gods. And in like fort, the Snake in ancient time was facred to Aesculapius, because it was thought to be without venom, and to contain in it many excellent medicines or remedies against other evills, and also a kinde of divine power or help to drive away calamities, whereof I remember that I have read this story in Valerius Maximus.

Rome (faith he) our City was for three years together continually vexed with Peffilence, fo as neither the mercy of God could be obtained for the release of this evil, nor all wit, power, or industry of man put an end unto it. At last by the care and travail of the Priests, it was found in the writing and Books of Sibyll, that unlesse they could obtain of the Epidaurians the holy Snake of Ela-

lapins, there should be no end of that pestilence.

For which cause there were Ambassadours sent to the City of Epidaurus, to entreat at the hands of the Citizens and Priests, that holy Beast or Snake (as was prophanely supposed) and they attained the end of their journey, for the Epidaurians did kindely entreat them, and fent the Snake of Æsculapius, and then (faith he) Tam promptam Epidauriorum indulgentiam numen infins Dei subsculum, verba mortalium cælesti obsequio comprobavit : That is, The very grace and power of God seconded that favourable indulgence of the Epidaurians, and with an heavenly obsequiousnesse allowed and performed the words and writings of mortal creatures, (meaning the Sibyls writings storelaid.) For that Snake (which the Epidaurians never fee but they worship, with as great reverences they would be a suppose that Snake (which the Epidaurians never fee but they worship, with as great reverences they would be a suppose the suppose Esculapius himself; for it never appeareth but for their exceeding great good and commodity) began to flide about the broadest streets and noblest part of the City, gently looking upon every body, and licking the earth, and so continued three days, to the religious admiration of all the beholder, bearing an undoubted aspect and alacrity, for the obtaining and aspiring a more beautiful habitation of the control of the con on: foat last it came to the Isle neer Rome, called Triremis, whereinto in the fight of all the Martin and the fight of all the Martin and the fight of all the Martin and the fight of all the f ners it did ascend and enter, and lodged it self round in that place, where standeth the house of the tus Ogulimus : which story is thus most excellently followed by Ovid in his Metamorphof.

The felk of Rome came hither all by beaps, both men and wives, And she the Nuns that keep the fite of V efta at their lives To meet the God, and welcome him with joyful noise: and as The galley rowed up the fiream, great store of incense was On alters barnt on both the banks, fo that on either fide, The faming of the Frankincenje, the very air did hide, And ulfo flain in Sacrifice full many cattel dyed. Anon's e come to Rome, the boad of all the world: and there The Serpent lifting up himself began his bead to bear Right up along the mast, when the top whereof on hie, He looked tound about a meet abiding place to fpie : The Tyber doth divide it felf intwain, and doth embrace A little Isle Tritemie, for so the people tearm the place, From either side whereof, the banks are distant equal space: Apollo's Snake descending from the mast, conveyed him thither, And taking off his beavenly (bate, as one repaiting hither, To bring our City bealthfulneffe, did end our forrows quite.

Thus faith Ovid: But the truth is, that the Poet did but faign this thing for the excitation and firring up of the mindes of men to Religion and religious worship of the Heathen Gods: and therefore this Snake of Epidaurus was but a fiction, and therefore in the beginning of the History he maketh it to be Efculapita in the likeheffe of a Snake, for in a vision he sheweth how that Efculapital appeared to the Roman Ambassador, and told him that he would appear in that form, saying ;

Pone metwe, veniam, simulachraq: nostra relinquam .

Hunc modo Serpentem, baculumq, neribm ambit, Perspice & usqs notas visum ut cognoscere possis : Vertar in hund, fed major eros tantufq; videbor . In quantum verti calestid corpora pollunt. Which may be Englished thus; Fedr not, for I will come and leave my forine. This Serpent which doth wreath with knots about this staffe of mine. Mark well and take good beed thereof, for into it tranformed will I be But big too I will be, for I will feent of fuch a fixe, As wherein may celestial bodies turn suffice.

But all Poets are fo addicted to faigning, that I my felf may also feem while I imitate them, to fet downfables for truth: and if ever there were fuch a Snake as this, it was Diabolical, and therefore in nature nothing to be concluded from it, and in that place of Rome called Biremis and Triremis, was Esculopius worthipped. And at this day in the Gardons called S. Batt bolomers-Gardens, there is a Marbleftip, on the fide whereof is the figure of a creeping Snake, for the memory of this fact, as

But in the Emblems and documents of the ancient Heathen, it is certain that Æfculapian, and the Snake and the Dragon, did fignific health, and from hence it came to have the name of the Holyfnake, and alfo to be accounted full of medicine. The true occasion in nature, was for that about Phylnut. the Countries of Bononia and Padua, they have a Snake which they call Biffe, and Biffe-angue fanca, and about Padua, Autea, which they fay is harmleffe. And as well children as men, do often take up the same into their hands, with no more sear and dread then they would do a Coney, or any other

tame and meek creature.

By the relation of Pellinus, it is in length five spans and five fingers, the head also compared with the body, is long, and in the neck thereof are two blanches, and betwire them a hollow place, the back part whereof is accenuaced into a thin and tharp cail, and upon either thap they have many teeth, which are sharp, and without poylon; for when they bite, they do no more harm then setch bloud only, and these men for oftentation sake wear about their necks; and women are much terrified by them in the hands of wanton young boys. The back of this Snake, (as writeth Ereftu) is blackish, and the other parts green, like unto Leeks, yet mixed with some whitenesse, for by reason it feedeth upon herb, it beareth that colour. They are also carryed in mens bosoms, and with them they will make knots. For the same Eraftin affirmeth, that he saw a Fryer knit one of them up together like a garter, but when he pulled it harder then the Snake could bear, it turned the head about and bit him by the hand, fo as the bloud followed, yet there came no more harm, for it was cured without any medicine, and therefore is not venomous.

In the Mountain of Maurinmia called Line, the Snakes are to familiar with men, that they wait up- Lea Afric. on them at dinner time like Care and little Dogs, and they never offer any harm to any living thing, except they be first of all provoked. Among the Bygerms inhabiting the Pyrenes, there be Snakes four foot long, and as thick as a mains arm, which likewise live continually in the houses, and not only come peaceably to their table, but also sleep in their beds without any harm, in the night-

Olam.

time they hiffe, but feldom in the day time, and pick up the crums which fall from their tables. Among the Northern people they have household Snakes, as it were houshold Gods, and they Among the Northern people they such their Infants, lodging them in the Cradles with them, as fuffer them both to eat and to play with their Infants, lodging them in the Cradles with them, as fuffer them note to cat and to play what them, and if they harm any body at any time, they account it they were faithful Keepers about them, and if they harm any body at any time, they account it it they were rathful Acepts and happy mischance. But after they had received the Christian faith, Plum piaculum, a very divine and nappy and did no more foster the Serpents brood, in detestation of they put away all these superfictions, and did no more foster the Serpents brood, in detestation of they put away an there imperiations, and and the fimilitude of a Serpent. Yet if it happen at any the Devil, who beguiled our first Parents in the similitude of a Serpent. Yet if it happen at any the Devil, who beguned out attached the Snakes hide themselves in their holes in the earth, and therein time that a house be burned, all the Snakes hide themselves in their holes in the earth, and therein time that a nouse pe purned, and therein thort space they so normally displant short space they so encrease, that when the people come to re-edifie, they can very hardly displant thort space they so encrease, that which their number. Plants in his Amphitryo, maketh mention of two named Snakes, which descended from their number. the clowds in a mower, but this opening and a combe, and therefore I will not expresse the Snakes to we a mane. There is no cause why we should think all Snakes to be without poyson, for the Poet hath not

warned us in vain, where he faith;

Frigidus, ô pueri sugite bino, latet Anguis sub herba: Which may be Englished thus : Fly bence you boys as far as feet can bear, Under this berb a Snake full cold doth lear.

For this cause we will leave the discourse of the harmlesse Snake, and come to those which are no way inferior to any other Serpent, their quantity and fpirit being confidered, wherefore we are to confider, that of Snakes which are venomous and hurtful, there are two kindes, one called the Water-snake, the other the Land-snake. The Water-snake is called in Greek, Hydra, Hydra, Hydrales, Karouros, and Enbydris, in Latine, Natrie, and Lutrie. Munffer calleth it in Hebren, Zeba, and Avicen relateth certain barbarous names of it, as Handrim, Andrim, and Abides , and Kedesudens, Echydrus, and Aftifichon. The Germans call it Nater, Waser nater, and Waser schlange: and they deicribe it in the manner as it is found in their Countrey, which doth not very far differ from them of our Countrey here in England. It is (as they fay) in thicknesses like the arm of a man or childe, the belly thereof yellow, and of a golden colour, and the back blackish-green, and the very breath of it is fo venomous, that if a man hold to it a rod newly cut off from the tree, it will fo infect it, that upon it shall appear certain little bags of gall or poyson. And the like effect it worketh upon a bright naked fword, if it do but touch it with the tongue; for the poyfon runneth from one end to the other, as if it were quick, and leaveth behinde a line or scorched path, as if it had been

And if this Serpent fortune to bite a man in the foot, then is the poyfon presently dispersed all over the body, for it hath a fiery quality, and therefore it continually ascendeth, but when once it cometh to the heart, the man falleth down & dyeth. And therefore the meetest cure is to hang the party fo wounded up by the heels, or elfe speedily to cut off the member that is bitten. And that which is here faid of the Water-fnake, doth alfo as properly belong the Land-fnake, feeing there is no difference betwirt thefe, but that at certain times of the year they forfake the water when it drawth

or falleth low, and fo betake themselves to the land.

They live in the water and in the earth, but they lay their egges on the land in hedges or in dunghils) and especially in those waters which are most corrupt, as in pools where there is flore of Frogs, Leaches, and Newts, and but few fifthes, as in the Lakes about Puteoli, and Noples, and in Emland all over the Fens, as Ramsey, Holland, Ely, and other such like places, and when they swim they best there breast above the water. They abound also in Coreyra, and about Taracina in Italy, and in the Lake No. clek, and especially in Galabria, as the Poet writeth:

Eft etjam illemalus Calabris in faltibus Anguis, Sananmea convolvens sublato pectore terga, Atque notis longam maculofus grandibus alvum, Dui dum amnes ulli rumpuntur fontibus, & dum Vert madent udo terre ac pluvialibus austris,

Stagna colit, ripi(que habitant hie pifeibu airan Improbus ingluviem, ranifque loquacibut explet. Postquam exchausta palus terraque arine debiscus, Exilit in ficcum & flammantia lumina tuquini. Savit agris, afperque fitt, atque exterritat ofth

Which may be thus Englished; Which may be thus Englished;
That evil Snake in the Calabrian coasts abides, Rowling bis fealy back by bolding up the breaft, And with great spots upon large belly glides, When as the Rivers fireams in Fountains all are ceaft. For whiles the moistened Spring with rain from South wind falls, It baunts the Pools, and in the water all black it feeds, In ravening wife both Fish and Frogs do fill his gall, For mby, when Summers drought enforce, then muft it needs Fly to dry land, rowling bis flaming eyes Rage in the fields to quench bis thirft full dry.

There be some Writers that affirm, that there is a certain Rone in a Water Smakes head, which it afteth or vomiteth up when the skin thereof is fleyed from the body, and after it is fo cast up, it and to received into a piece of filk, the vertue whereof it to be proved after this manner; Fill a braffe Caldron or Kettle full of water, and about the same vessel so filled, binde this stone falt, as it were to the handle or bayl thereof, and you shall finde that every day this frone so remaineth bound to the Kettle, that the water will decrease eighteen ounces. And this Krunides affirmeth that he bound to a woman that had the Dropfie, and the was thereby delivered from her difease; for every day he found that her belly did fall the quantity of four fingers, until it came to the natural bigneffe. and then he took it off, for he faith, that if he had not then taken it off, it would also have dreed no the native humiditv.

In like fort, the vertue of this stone is applyed against the theume in the legs, or any flux of the eres, ears or head, but the use of it must not exceed the quantity of three hours at a time. It also driveth out of the body all venomous Worms, and is a special remedy against their biting and stinging. This stone is also called Serpentinus and Dreconites, but it is questionable whether it be generated ing. Instruction and server and Determine, but he is questionable whether it be generated in the head of the Snake, or by their vaporous breath, concurring together in the Spring or Winterfealon. Some of these stones are said to be of a blewish green colour, and the form thereof pyramidal: Albertue saith, he hath seen one of these that was black, and not lightsome, only about the edges of it there was some palenesse apparent, and in the superficies or upper part thereof, there was (as he writeth) a beautiful picture of a Snakes proportion, and the vertue thereof did put to flight venom-

ous Beafts, and also cure their harmful poylons.

Such like things we have already shewed to be in the stone which the Toad is faid to have, but this stone is more likely to be the Ophites, for in the Castle of Tangra, once the seat or habitation of Charles the fourth, there is a Chappel wherein are many precious stones, wrought in the walls and doors, and among divers other these Ophies. But whereas there is a pyramidal form attributed to these stones, I take it therefore that it is the same which Pliny calleth Gloffapetra, for in shew it refered bleth the tongue of a Snake, and the tongue of a Snake being great or broad at the root, and finaller toward the end or tip thereof, is rightly faid to be of a pyramidal form: and among the Germans it is called by a peculiar word, Naterzamen, that is, Snakes-tongue.

And such a kinde of flome as this Snakes-tongue. (as Agricola and forme other Authors write) is

found in a certain earth neer Limburgh in Sawoty. And Comradus Gefter affil meth, that there is a ceruin Town in Germany called Actipos, where there is one of thefe fromes half a cubit long, and thereforeit feemeth that they are not all generated in Serpents or Snakes heads, 'Among the French men this flone is called Sugno, because there be Sergents feen in it twyfing their tails together, or folding

them one within another.

There was wont to be a superfittions way to extract or expresse this stone from out of the Snake, which was done in this manner; First, when they had taken the Snake alive, they did prefently hang brup by the tail, then just under neath her they did make a furfumigation of Laurel, and lo did conjure the Snake, faying; Per Dominum qui te creavit, lapidem tuum quem in capite tenes te inflanter rikne jubeo: This kinde of enchanting charm, I hold not worthy to be translated, and yet let me not be blamed for the relation of it, feeing it is pertinent to this ftory to know all the good and evill about these Serpents. And therefore, not to expresso the same at ath, might argue in me, either ignorance, or filly precisenesse: and again on the other side, to make it vulgar, might bring me into suspicion of some approbation: therefore let the Reader know it from me, but understand it from fome other.

And for mine own opinion, I account no better of these Snake-stones then I do of the Toadflores, concerning which I have already given my opinion in another place. And therefore what here is related of this flore, let it be examined, and then be either received or refused.

Many, and almost infinite are the Epithets which are given to Snaker, whereby their nature is expressed, as Aliger anguir, the winged Snake, black, fierce, blew, greedy, wilde, cold. Gorgonbart, wretten, fliding, deadly, lightfome, spotted, marcial, threatning, purple, wholesome, scaly, terrible, winding, grim, swelling, fearful, venomous, green, infolded or implicit, horrible, history, Martian, Maurian, petilent, retorted, and such other like, as it hash pleased the several Authors writing heres of to see the several Authors writing heres of to aftribe and attribute unto it. Which we will not profecute with any explication, but only leave

them to the Readers pleasure, being only content to mominate them.

There is great account or recknning made of their egges, which they ley in the Samuler times. for first of all they are so glewed and conjoying together, partly with the species and modifields which proceedeth from their mouths, and partly with the spume and fronth of their own body; that aman feeing their heaps, would judge them to be coupled sogreher by force arrificial device. These egge thus knotted together in bour hes, the Letines call Anythum. The Devider or arrient Wifards of England and Scotland. have delivered, that is she Snake hide, these will of their own accord by up into the air and skind. into the air, and then if fome wife man take them by prevention, before they touch the greated again, the Snakes will follow him as fast as any Horse, until he come to some River, into the which they dare not enter.

And the folly of these also proceeded foliates that they were not affiamed to report, that if one of these Anguines or bunches of egges, were exception pieces gold, it would swim in a River sgainst the stream. These they commended unto Princes and Green montes carry about with them in the simulation of the stream. is the time of wars and other contentions, and that therefore when a Reman Knight of Volentiis,

There

was found by Claudim to carry one of these about him, he was by the Emperors commardment

was found by Claudim to carry one of these soons and an analysis and policy of the course of the cou manner; I ney are round and total in evident without, they are covered with a skin or crue, great bunches for tyeor fifty, or a hundred in a clufter without, they are covered with a skin or crue. great punches and whiter then the substance contained within it, which is like matter; or the rotten much harder and whiter then the substance contained within it, which is like matter; or the rotten much parcer and whiter then the authority as big as Bullies, Plums, and feldom bigger , being moft com-Egges of a Hen or Duck, in quantity as pig as numes, rimins, and assisted bigger, being most commonly very round and orbicular. Yet Gener reporteth, that he had one fent him of the proportion of a Lientil, and as great as the fift of a Man, and within every egge appear centain small things, like the tails of Serpents, or Leaches, being in number ten, five greater and five smaller, one folded or the tans of Serpents, of Leaches, the large also little pufules upon the skin or crufts, whereof one doth

or touch the other.

Out of the Egges come the young ones, but I cannot affirm what great affection the old ones Out or these egges come the young ones, but trained to get the every one in that multime bear unto them, or that when many Snakes lay their egges together every one in that multime hath skill to differn her own Egges from the other. For I have been with other my Colleagues or nath sain to uncertainer own begas it the destruction of many thousands of them, and never perceived that the old Snake did with any extraordinary affection fight for their egges, but rather forceived that the old onake and with any satisfaction, what we pleased; which sometimes we brake fometimes feattered abroad upon the dunghill out of which we digged them, and fometimes we cast them into the next River we came at, but never faw any of them recollected again to their former place by the Snakes, although the place were very full of them, and therefore I conclude for mine own experience, that Snakes cannot be perceived to bear any exceeding love in nature to their egges or young ones.

Their ordinary food for the most part, is earth, Frogs, Worms, Toads, and especially Paddocks or crook-backed Frogs, Newts, and small fishes. The Foxes and Snakes which are about the River Nilm are at continual variance, and besides, the Harts are by nature commonenes to all

They are not in venom inferiour to other Serpents, for they infect the waters neer to houfer; and are many times the causes of diseases and death, whereof the Physicians cannot discern. When they bite or fling, there followeth extream pain, inflamation, greenneffe or black neffe of the wound, dizzinessein the head, and death within three days. Whereof dyed Phylottetes, General of the Fleet of

Greece, in Lemnos, Dadalus and Menalippus.

The cure of this evil must be by Origan stamped and laid to the fore with Lie and Oyl, or asses of the root of an Oak with Pitch, or Barley-meal mixed with Honey and Water, and sod at the fire. And in drink take wilde Nofewort, Daffadil flowers, and Fennel-feed in Wine. And it is also flid, that a man carrying about him the Liver of a Snake, shall never be bitten by any of that kinde. And this Liver is also prescribed against the Stone in the Bladder, being drunk instrong drink. And Of Spiders and their several forts.

And first of shose that are commonly called P HA LA NG IES. thus much for this Serpent.

Doctor Bonhams discourse of Spiders.

77.15 1 1950

Tiblis kinde of venomous creature, of the Latines is called Aranem, or Aranea, and of Glore in his Books De nature Deorum, Arancola, and Arancolus. Of the Greetans, Arachine or Arachine, fichius termeth it Stibe; the Hibrers name it Acobiths, Acabith, and Semantille, the Arabites, Sibhs, and Philible; in the German tongue Spin, and Briker; in English, Attercop, Spider, and Spingrish and Philible. of the Brahanders, Spinne; in France, Araigne; in Italy, Ragno, and Ragna; in Spains, Araigne; of the Brahanders, Spinne; in France, Araigne; in Italy, Ragno, and Ragna; in Spains, Araigne; of the Pointains, Pajak, and Pajeczino; of the Hongalan, Pary; of the Barbarians, Roston, and Referent. Isodofe in his twelfth Book faith, that the Spide is termed Araness; because the is both bred and fed in the air; but herein he hath falled into ble error. For if they lived only in the air, and by the air, as he would feem to enforce I married by the standard and supposed they have the standard and supposed the standard and supposed they have the standard and supposed the standard a what end and purpole they should so buffly make and pitch their nets for the ensisting of flies And if they receive their first being and breeding in the air, I cannot see to what purpose lift do sithet

lay egges, or exclude small little Worms after their coupling together.

But we will easily pardon this presumptuous Etymologist, and diver deep into literpressions, with others also of the same humor, whose ordinary custom thus to to dally and play with words. It will be to the same humor, whose ordinary custom thus to to dally and play with words. with them esteemed as good as Statute-law, for the most part. There are many force of Spiders and sall of them have three joynts a piece in their legs.

Efiq; caput minimum toto quoq; corpore parvum eft;
In latere exclet digiti pro crutibut barent In latere extlet digiti pro cruibus barent,
Latera venter babet; de quo tamen illa remittet

Stamina. Of the Spider.

Which may be Englished thus: Little is their head, likewife the body fmall, All over is, and fingers thin upon the fides, In stead of legs, out of the belies flanck do fall : Tet out of which she makes ber web to glide.

All Spiders are venomous, but yet some more, and some lesse. Of Spiders that neither do nor cando much harm, fome of them are tame, familiar, and domestical, and these be commonly the greatest among the whole pack of them. Others again be meer wilde, living without the house abroad in the open air, which by reason of their ravenous gut, and greedy devouring maw, have purchased to themselves the names of Wolss, and hunting Spiders. The least fort of these weave no webs at all, but the greater beginneth to make a small and harsh web about hedges nigh unto the earth, spreading and setting the same abroad in the very entry, and in void places neer their the catting holes, their deceitful nets, observing very diligently the stirring of their deceitful webs, and perceiving them moving, though never so lightly, she maketh no stay, but with all speed possible hastneth her self to the place, and whatsoever she there findeth, she seizeth upon as her lawiul prize.

The most dangerous and hurtful Spiders are called *Phalangia*, if they bite any one, (for they never frike) their poylon is by experience found to be fo perillous, as that there will a notable great fwelling immediately follow thereupon. These kindes of venomous Spiders, are of two fundry fores. for some of them are leffer, and some greater. The leffer fort are very unlike one to another, and of changeable colours, violent, libidinous, hot, stirring, sharp-topped, holding on their pace and way, as it were in jumping manner or leaping-wife: and these I finde to be called by Aristotle in his 11. Book De Animal, Pfullas, or Pulices, and Pitheci or Simii. Of fome they are called Oribates, because they are usually found among Trees that grow upon Mountains. They are also called Hypodromi. because they live under the leaves.

The Phalangium or Phalanse Spider, is unknown in Italy (as Pliny faith) and there are found many forts of them. One fort of them is very like unto a great Pilmire, but much bigger, having also a red head, but all other parts are black, speckled, and garnished with many white spots running all alongst their bodies. This formicarian or Pismire-like Phalana, of Actius is described to have a body much refembling foot in colour, his neck ash-coloured, and his back glistering, as it were with many flurs on it. Nigander calleth it Agroftes, and Actius, Lucos. The Latines tearm it Venator , that is, the Hunter. This stingeth but weakly, without any pain at all, but yet it is somewhat venomous, though not very much. This kinde of Phalane is often found among Spiders webs, where (after the fashion of some Hunters) they beguile and intrap Flies, Gnats, and Bees, Gad-flies and Wasps. And (if Lonicerus write no more then may be warranted for truth,) those great Horse-flies or Ox-flies and Brimsees, that in Summer season vex Cattle, and whatsoever they lay their clowtches on, that they hold fast and destroy; and thus live they by taking of booties and

There is no man (I think) fo ill advised, that will confesse this to be the same creature which Arifollecalleth Pulex, for the body of that by his description is broad, rowling, round, and the parts about the neck have certain lines or cuts: and besides, about the mouth there appear and seem to bud forth three eminencies or standings out.

There is another fort of Phalangium, called by Nicander, Rox, of Actim, Ragion, of Elianm, Rhax, (becauseit is so like the kernel or stone that is found in Grapes,) and this kinde of Spider is of a round figure, black in colour, the body gliftering, and round as a ball, with very short stumped feet, yet neverthelesse of a very swift pace. They have teeth and their mouth is nigh their belly, and when they stir, they gather up their feet very round. In the description of this Spider, Aesius, Elianus and Pliny do wholly consent and agree in opinion, and yet Ælianus was a little besides the way, when he set down Polas macrous, for microus, long feet for short feet; and that this kinde of Spider was only found in Lybia, and not elsewhere.

That kinde of Spider termed of Pliny, Afterion, seemeth to be all one with the former, saving that this is more known by his little white spots made star-wife, and the glistering stripes or rays wherewith his body feemeth to be over-fprinckled. Pliny only mentioneth this, as if Arifotle, Actius, Galen and Avicen, had never heard of it.

The most venomous and hurtful of all these, is that which Nicander calleth Pederos, of colour azure, or bright blew, which hath long, high, and lofty feet on both fides of the body. The Scholiast addeth Dafu and Meteoren, that is, lanuginofum and fublime, fost like cotten or Wooll, and lofty or high, and not sublime lanuginosum, as Lonicerus translateth it. Pliny faith, that this Spider hath a black moffineffe or foft down, although it will fearfe fink into my head, that any Spider that is of an azure or blew colour, hath any foft hairs, or woolly substance of a black colour.

There is another kinde of Phalangium Spider called of Nicander, Dysderi, which name is neither to be found in Ariffotle, Pliny, nor Actius, nor yet in any other ancient Author that ever I could read, which some others call, and that very properly. Sphekion, quast vestarium, because it is so like a red Wasp, saving that it lacketh wings, and this Wasp-like Spider is of a passing deep red colour, and counted far worfer then the blew Spider, although the azure or blew Spider only by

touching doth infect with poyfon, and will break any Crystal glasse, if it run over it though never so speedily, or do but touch it in glancing wise, as Scaliger beareth witnesse.

There are two forts of Phalangie Spiders called Tetragnatha, and the worfer is that which hath half of his head divided with one white line, and another white line running crosse-wise. There is another of these not so hurtful as the former, and this is of an ash-colour, and very white in the hinder-ther of these not so hurtful as the former, and this is of an ash-colour, and very white in the hinder-there is also a Spider coloured as this is, that maketh her web by walls sides for the taking parts. There is also a Spider coloured as this is, that maketh her web by walls sides for the taking of Flies, which as some affirm, hath little or no venom in it at all. Actius saith, that the Tetragnathus of Flies, which as some affirm, hath little or no venom in it at all. Actius saith, two swelling or little is a kinde of balangium, having a broad and whitish body, rough sooted, with two swelling or little bunches standing out in the head, the one somewhat broad, the other standing right forth, so that at the first, one would imagine that it had two mouths, and sour jaws.

the first, one would magnitude the state of the state of

There is to be found in Harvest-time amongst Pease, Beaus, and other sorts of pulse, (when they are There is to be found in Harvest-time amongst Pease, Beaus, and other sorts of pulse, (when they are gathered and reaped by the hand) certain small Spiders called Kantbaridess Eikela, in shew like unto gathered and reaped by the hand) certain small Spiders called Kantbaridess Eikela, in shew like unto Tares, Cantharides or Spanish-sies, of a very red and stery colour, such as we Englishmen call Twinges, Cantharides or Spanish-sies, of a very red and other Beasts do many times die. There is another by eating or licking up of which, both Oxen and other Beasts do many times die. There is another by eating or licking up of which, both Oxen and other Beasts do many times die. There is another kephalokyousers, and Diosovides nameth it Kephalokyousers, because it is so presumptuous bold as to strike at the hands of travellers by the it Kephalokyousers, because it is so presumptuous bold as to strike at the hands of travellers by the it Kephalokyousers, when as either it passes the own in gliding manner by her sine thread, or that she tum-High-ways, when as either it passes do on the support. It is a small creature to see to, keeping on the pace very fearfully, nodding with the head, reeling, and as it were staggering, being great and heavy in the belly, somewhat long of body, and of a greenish colour. It carryeth a sling in the top of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And of her

Whereupon the Scholiast feemeth to infinuate to us, that this kinde of Spider is winged, which no man (as I judge) hath hitherto observed. Ponzettus and Ardoynus do take the Cranocalaptes to be a Tarantule, but herein they are both mistaken, as was Rabbi Mojes before them. The Spider called Sciencephalus, in form differeth but little from the former. It hath a head as hard as a stone, and the lineaments and proportion of the body do much resemble those small creatures which are seen about

Lamps lights, or candles in the night time.

There cometh in the last place to be described, the Phalangie Spider of Apulia, commonly known by the name of Tarantula, taking his denomination from the Countrey of Tarantum, where there are found great store and plenty of them. Ferdinandum Ponzettum imagineth, that it hath but only six sees, and Ardonnus is of the same judgement, and surther saigneth, that it hath a stretched out tail. Rasis calleth a Tarantula, by the name of Spta, Albucasis, Alfari, Rasbis Moses, Aggonsapa, Avicen, Sebigi, Doctor Gilbert, Taranta, therein sollowing Ardonnus, which maketh two sorts of Tarantulas, the one of a brown, the other of a yellow colour and cleer shining, such as are to be sound in Egypt. Pliny (as you read a little before) said that the Phalangium was not known in Italy, but in these days they are sound throughout all the Southern parts of that Countrey, especially night the Sea-shore, as both Harvest-men and Hunters can well testifie by their own would experience.

Possettus was much deceived, when in his third Book and xv. chapter entreating of the Scorpion, he expressly affirmeth the Phalanx to be such a venomous stye. It is a vengible and cruel creature (as Alexander ab Alexandro saith) and to be touched, horrible, venomous and pestilent: and most especially their biting is exceeding venomous in the parching heat of the Summer, but at other seasons of the year not so great. There be many forts of Spiders sound in very cold Countries, but no Phalangies at all; or if there be any, yet have they very little poyson in them, and nothing comparable to them of hotter Climates.

All the forts of Phalangies do lay their Egges in a net or web, (which for the purpose they make very strong and thick.) and sit upon them in very great number, and when their brood is increased to some growth, they kill their dam by their hard embracements, and sing her clean away; and surther, casting off all satherly affection, they many times serve the male with the same suce, if they can come handsomely by him, for he is a helper to the semale in sitting over their egges. They hatch at one time three hundred, as hath been seen by the testimony of Bellonius, in his Book Singul, observed. chap. 68. The Tatanulaes lie commonly lurking in holes, chinks, and chaps of the earth, and with their teeth they bite and wound at unawares, incircumspect. Mowers, and harvest-folks, and rash Huntsmen, who think of no such matter: and therefore they that are acquainted with their sleights, do wear Boots and Gloves on their hands and legs, for their surther defence, so often stehy go forth either to hawking, hunting, or to reaping and mowing, or any such like labour in the common fields.

All these Spiders are venomous even naturally, for that is so setted and deeply sastened in them, as it can by no means be eradicated or taken away. Neither suck they this venom and poysonous quality from plants or herbs, as many men think, which in very truth they never so much as tast of, neither show when one do they purchase this venomous complexion and nature from any naughty, hurtful, and malignant is bitten of quality that is in their meat, by reason their chief food and sustenance is Flyes, Gnats, and Bees; and any Palaangle without question they can suck and draw no such cacochymical juyce from their bodies. If the Formicarian (which I call the Pismire-like) Phalangle do bite any man, there will presently sollow most fear-susceding great tumor upon the wounded place, the knees are loose and seeble, trembling of the heart, and decay of strength do succeed, and sometimes it induceth death it self.

Nicander faith, that they who are bitten of this kinde of Spider, do fall into fuch a profound sleep, as that they will never be awaked, for they have and suffer that which Histories report of Cleopatra Queen of Egypt, who to escape the fingers of Angustum, because she would not be brought to Rome in triumph, caused two Serpents called Asps, to be fet to her breaths, which did sting her to death, whose nature is to give a heavinesse and sleep, without any shrinking or mark in the skin, only putting forth a genile sweat out of the face, as if one were in a trance and hard to be awaked.

The Spider called Agrofi's, maketh but a small wound with her biting, and in a manner without any pain at all, and no ways deadly, unlesse it be but slightly regarded, or that no care be had for the cure in the beginning. The Phalangie that is called Dusderus, which is sashioned like a Wasp, if he hurt any one by his biting, it causeth the same accidents that the azure or blewish-coloured Spider doth, but yet not altogether so terrible and vehement. And besides, the Dusder spider with her poyson, bringeth a wasting and pining away of the whole body by degrees, without any great sense.

If a man be poysoned with that kinde of Spider which is found among pulse, and is (as I said before) like unto Spanish Flies, there will presently arise certain pusules, risings or swellings, much like unto blisters, as if one were scalded with hot water, in which swellings there will commonly be much yellowish matter; besides, the patient is much disquieted, vexed, and too much out of order; the eyes seem to be writhed, deformed, looking asquint on the one side, the tongue saltereth and stammereth, not being able to found their words, or to pronounce directly: their talk is idle, they wander and rove up and down in great perplexity; their heart being tormented, tossed and turmoiled with an extraordinary kind of surious passion.

The Spider that is found in the pulse, called Ervum, which is very like to Tares or Vetches, produceth by his venom the same evil effects that the former doth; and if Horses or other beasts do by chance devour any of them, their bodies are so instanced by means of their unquenchable thirstiness the poyson causeth, that many times they burst asunder in the midst. If the Cranocalaptes wound any man (as Pliny assureth us) it is not long before death it self do succeed. And yet Nivander and Asius hold the contrary, and would make us believe that his hurt is soon remedyed, without any great ado: yet herein they do consent, that if any be hurt with any Spider of this kinde, there will follow a great pain of the head, coldnesse, swimming and giddinesse of the brain, much disquientsses the whole body, and pricking pains of the stomach. But notwithstanding all this (saith Niesmales), the patient is soon remedied, and all these above rehearsed passions quickly appeased and brought to an end.

The Sciencephalm, as it much refembleth the Cranocalaptes Spider in form and proportion, so in his force, effect and violence they are much alike, causing the same symptomes, accidents and passions as the former. The wound that the Spider called Ragion insticteth, is very small, so that a man can hardly discern it with his eyes; but yet if one be hurt therewith, the lower part of the eyes, and the eye-lids wax very red. Besides, the patient seeleth a shivering cold or chilnesse in his loins, with weaknesse and feeblenesse in the knees, yea the whole body is taken with a great quaking cold, and the sinews by means of the violence and rancknesse of the poyson, suffer a Convultion. The parts serving to generation, are made so impotent and weak, as that they are not able to retain the seed, nor yet to contain their urine, which they void forth much like in colour to a Spiders-web, and they seel the like pain as they do which are stung with Scorpions.

Of the the wounding of the Star-spider feeblenesse and weaknesse followeth, so that one cannot stand upright, the knees buckle, sleep and shaking drousinesse feizeth upon the hurt parts: and yet the worst of all is the blewish Spider, for this bringeth dimnesse of the eye-sight, and vomiting, much like unto Spiders and cobwebs in colour, fainting and swounding, weaknesse of the knees, heavy sleeps, and death it self.

If a man be wounded of the Tetragnathian Spider, the place waxeth whitish, with an intolerable, vehement, and continual pain in it, and the member it self witheresth and pineth away even to the very joints. Finally, the whole body by receiving any wholesome sustenance, is nothing at all relieved thereby, yea and after a man hath recovered his health, yet is he neverthelesse disquieted by much watching for a long time after, (as Aetiss writteth.) Nicander in expresse words consessed in the selfeth, that the Ash-coloured Tetragnath, doth not by his biting insuse any venom or like hurt. If the speckled Phalangie of Apulia, which is usually known by the name of Tarantula, do bite any one, there will follow divers and contrary accidents and symptomes, according to the various constitution, different complexion, and disposition of the party wounded. For after they are burt

graph :

by the Taranula, you shall see some of them laugh; others contrariwise to weep, some will clatter by the Taraninia, you man see some or them to hold their tongues, and otherform again you out of measure, so that you shall never get them to hold their tongues, and otherform again you out of measure, to that you main here; this man fleepeth continually, and another cannot be brought to any rest at all, but runneth up and down, raging and raving like a mad man.

nany reit at an, but runnerin up and aways, to be fome great Lords or Kings, and that their authority.

There be fome that imagine themselves to be fome great Lords or Kings, and that their authority. There be tome that imagine the interest of and wide; and for that cause they will seem to charge Empire and signory, extendeth it self far and wide; and so that cause they will seem to charge Empire and lignory, extended it less that all without as they cender their favours, and will others by vertue of their absolute and Kingly authority, and as they cender their favours, and will avoid their displeasure, to see this or that businesseed it and with others again the contrary avoid their dipleature, to lee this of firong imagination they cannot be otherwise disswaded but that concert to much prevailers, that they lie in fome deep dungeon or prison, with bolts and shakels they are taken prisoners, that they lie in some deep dungeon or prison, with bolts and shakels they are taken primoners, that legs can bear, or that their neck and feet lie continually in the about their reet, 10 many of them to be cheerful, quick of spirit, and lively, with dancing, swinging and shaking themselves. With others again you shall have nothing but sadnesse, and heaving and shaking themselves.

ing and making themselves, unaptrieffe to do any thing, as if one were aftonyed, fo that nothing neffe of minde, brown-fludies, unaptrieffe to do any thing, as if one were aftonyed, fo that nothing nette of minde, province and feeling, feemeth to pinch them, being to fee to very but numneffe, and dulneffe of moving and feeling, feemeth to pinch them, being to fee to very

senselesse.

nicience. In conclusion, as drunkennesse to fundry persons is not all one, but much different, according to the diversity of complexions, and natural constitution of the brain: fo neither is the madnesse or frenzy fits of these persons all one that be insected with a Tarantulaes poyson: but some of them are fearful, filent, ever trembling and quaking: and others again are more fool-hardy, rash, preare rearrus, mene, ever, full of noise, doing nothing else but call and cry out; and some few feem to be very grave, constant and stedfast, that will not alter their purposes for a world of wealth. But let them be affected either with this or that passion, yet this is common to them all, as well to one as to another, that they are generally delighted with musical Instruments, and at their found or noise will fo trip it on the toes dancer-like, applying both their mindes and bodies to dancing and frisking up and down, that during the time of any mufical harmony, they will never leave moving their members and limbs, like a Jackanapes that cannot fland fill. And which is more frange, they will use these motions and gestures when they are ready to depart this life, through the lingering stay and vehement cruelty of the poyfons operation: and yet for all this, though they be fo neer unto death. vet if they hear any mulick, they come again to themselves, newly gathering their spirits and strength, and with a greater alacrity, promptnesse of minde and cheer, they foot it as frolickly as ever they did or could have done.

And thus doing and dancing both day and night, without any notorious intermission, and by their continued sweating, the poyson being dispersed into the pores of the skin, and evaporated by infenfible transpiration or breathing out, are at length by this means recovered to their former health and state of body. And if the Pipers and Fidlers cease playing with their musick, though never so little a while before the matter of the poyfon be in some part exhausted, then will they make a recidivation and returning to their former passions and griefs, wirh which they were at first tormented and disquieted. But yet this is the most strange, deserving the greatest admiration of all, that all those persons which are bitten or wounded by any Tarantule, they will dance so well, with such good grace and measure, and sing so sweetly, and withall descant it so finely and tunably, as though they had

spent all their life time in some dancing and singing-school.

Nevertheleffe, Cardan, contrary to all authority and experience, calleth in doubt and question this point, and at last concludeth that they cannot be restored to health again by musick. Wherein he doth marveloufly repugn and contrary, both Falin, Platerus, Theodorus, Zuingerus, Andres, Matibiolus, Bellunenfis, Ponzettus, Paracelfus, and many other famous learned men. Truly, a bare contradiction against fo great authorities, is far unworthy and unbefeeming a man any thing (though never so little) seen or exercised in Philosophy : much more so great a Philosopher and Physitian as Cardan was. Yet sure I am of the opinion, that Cardan did not erte in Philofophy through ignorance, but having a defire to appear more learned, he did ever bend himfelf to impugn that, which he knew the foundest and best part of men did hold and maintain. But this little which I have here spoken, shall serve sufficiently for the discussing of Cardani

opinion. And furely, if the harmonical found and melody of warlike drums and trumpets, hath cured furious, mad, and enraged Horses, and mitigated the pain of their legs and hips, as Asclepiades hath written, I fee nothing to the contrary, but that it may help those persons that are woulded of any Tarantula. The Pope with his Poll-shorn generation, have mustered divers of the Saints together, and have affigned and appointed to each his fundry charge and several office apart, for the one of fundry difeates. As for example, S. Anthony can heal the burning ; S. Roch the Peftilence, notwithfranding that S. Seb offian hath some skill in it also. Saint Cofmus and Damian are good for all biles and swelling difeafes. S. Job for the pocks. S. Appolin for the tooth-ach. S. Petronella can drive away all manner of Agues. And S. Vitus or Vitulus (we may well call him S. Calf) that in times past excelled in the mulical Art, doth direct all Dancers, or fuch as will leap or vault : So that if this Saint be invocated and pacitied with mufical harmony and melodious found of inftruments, he will be an excellent Aportheaty and Doctor for the curation of any that are wounded with a Tarantula. Superfitious people fondly imputing that to the Patron and Proctor formetimes of Musick , which ought rather to be attributed to Musick it felf, and motion of the body. Diescorides

Dioscorides concerning the common bitings of hurtful Spiders or Phalangies, writeth thus: The accidents (faith he) that do accompany the bitings of Spiders, are these that follow: The wounded place waxeth red, yet doth it not swell nor grow very hot, but it is somewhat moist. If the body become cold, there will follow trembling and shaking, the groin and hams do much strout out. and are exceeding diftended; there is great provocation to make water, and ftriving to exonerate nature, they sweat with much difficulty, labour and pain. Besides, the hurt persons are all of a cold sweat, and tears distil from their eyes that they grow dim-fighted therewith. Actius further addeth, that they can take no rest or sleep, sometimes they have crection of the yard. and the head itcheth, other whiles the eyes and calfs of the legs grow hollow and lank, the belly is stretched by out means of winde, the whole body is puffed up, but in especial the face, they make a maffeling with their mouth, and stammer, so that they cannot distinctly be understood.

Sometimes they can hardly void urine, they have great pain in the lower parts, the urine that they make is waterish, and as it were full of Spiders webs, the part affected hath a great pricking and which Dioscorides (as you read a little before) will by no means yeeld to, and it is a little red. Thus far Actius from whom Paulus Aegineta, Aduarius, Ardonnus and some others differ but a little. In Zacombus an Isle in the Ionian-Sea, on the West of Peloponesus, if any there be hurt of a Phalanoium, they are otherwise and more grievously tormented then in any other place, for there the body groweth stiffe and benummed; besides, it is very weak, trembling and exceeding cold. They suffer also vomitting with a spasm or cramp, and inflamation of the virge, besides an intolerable pain in the ears and foals of their feet. The people there do cure themselves by bathes, into which if any found man after that do enter to wash himself, or be drawn into the same by any guile or deceitful means, he will forth-with fall into the same griefs and passions, that the other tick patient endured before he received remedy. And the like to this writeth Diofcorides, in his Chapter of Trifolium afphaltites, in these words following.

The decoction (faith he) of the whole plant being used by way of somentation, bathing or soking the body, ceaseth all those pains which are caused by the biting or stinging of any venomous Serpent: and with the same bathing or somenting whatsoever ulcerous persons shall use or wash himfelf withall, he will be affected and have the fame accidents, as he that hath been bitten of a Ser-

Galen in his Book De Theriaca ad Pisonem, ascribeth this to miracle, accounting it a thing exceeding common reason and nature : but I stand in doubt that that Book was never Galens, but rather fathered upon him by some other man. And yet Ælianus writeth more miraculously, when he affirmeth that this hapneth to some healthy persons, and such as be in good plight and state of body, never fo much as making any mention of ulcer or fore. Thus much of the symptomes, accidents, passions or effects which stick and wait upon those that are hurt by Spiders. And now I come

The general cure, according to the opinion of Dioscorides, is, that first there must, be scarification made upon the wounded place, and that often, and cupping glasses must be applyed and fastened with much flame to the part affected. Absyring counsel is to make a fumigation with Eggeshels first steeped in water, and then being cast on the coals with Harts-horn or Galbanum, to perfume the venomed part therewith. After that to use Scarifications, to let bloud, or to suck the place; or to draw out the venom with Cupping-glasses: or (which is the safest course of them all) to apply an actual Cautery, except the place affected be full of finews. Lastly, to provoke sweat well, either in bed, covering the patient well with cloathes, or it is better by long and easie walking to procure fweating. In some to attain to the perfect curation, you must work both with inward and outward means, fuch as here shall be prescribed and set before your eyes: whereof the most choise and approved I have set down for the benefit of the Reader: and first I will begin with Dioscorides.

Inward Medicines out of Dioscorides.

Take of the feeds of Southern-wood, Anife, Dill, the wilde Cicer, of the fruit of the Cedar tree. Plantain and Trifoly, of each a like quantity; beat them to powder by themselves, before you do mix them: The dose is two drams to be taken in Wine. Likewise one dram of the seeds of Tamarisk drunk in Wine, is very effectual. Some use decoction of Chamapitys, and the green Nuts of the Cypresstree in Wine. There be some which praise the tree of Cray-fishes, to be taken with ashes, milk, and Smallage feed; and this medicine experience hath approved and confirmed, for the ceasing of all pains. Lye made of Fig-leaves is drunk with good successe against all bitings of Spiders.

It is good also to take the fruit of the Turpentine tree, Bay-berries, leaves of the balm, and the seeds of all forts of Carrots: or to drink the juyce of Mirtle-berries, of the Berries of Ivy, or Mulberries, the juyce of Colewort leaves, and of Clives or Goofe-greafe with Wine or Vinegar. A dram of the leaves of Been-trifoly drunk in Wine, the decoction of a Sparagus, juyce of Sen-green, or any opening juyce is good for the same. Some use with very good successe, the leaves of the herb called Balm with Nitre, and Mallows, boyled both leaf and root, and so taken often in a potion. The leaves of the herb called Phalangium, with his flowers and feeds. The feeds of Nigella also ferve to the fame

fingu-

Medicines out of Galen.

Take of Aristolochia, of Opium, of either alike much, four drams, of the roots of Pellitory of Take of Attitionia, of Opinim, of either annual of a Bean. The dole is two Trochifees, to the quantity of a Bean. The dole is two Trochifees, to the quantity of a Bean. The dole is two Trochifees, Spain three drams. Make thereof Processes, of a Rams hoof tempered with Honey, and drunk with with three ounces of pure Wine. The after of a Rams hoof tempered with Honey, and drunk with with three ounces or pure vvine. The aims of all and of Afrologe or Hartwort Wine. Remedies of Diophantes against the bitings of Phalangies. Take of Astrologe or Hartwort Wine. Remedies of Diopponies against the bittigs of along Opium one dram, make thereof Tro-four drams, of Pellitory of Spain as much, Pepper two drams, Opium one dram, make thereof Trotour drams, or reintory of Spanias much, report them in a good draught of pure Wine. Another chifces to the quantity of a Bean, and take two of them in a good draught of pure Wine. Another chilees to the quantity of a Dean, and take two Rue, Rocket-feed, Styrax, Sulphur vivum, of either alike more excellent: Take of the feeds of wilde Rue, Rocket-feed, Styrax, Sulphur vivum, of either alike more excellent: 1 are of the leeds of white tasks them to make Trochifees, as before, with the much fix drams, of Callorsum two drams, commix them to make Trochifees, as before, with the much fix drams, of Castoreum two utants, command that it wine. Another: Take of Myrrhe, Caft. bloud of a Crevish. The Dose is one scruple and a half in Wine. Another: Take of Myrrhe, Caft. bloud of a Crevin. The Dole is one femple and drams, of Galbanum three drams, Smallage-feeds and reum and Styrax, of either one dram, Opium two drams, of Galbanum three drams, Smallage-feeds and reum and Styrax, or either one drain, Opinion to Anife-feeds, of either alike two ounces and a half, Pepper thirty grains; make them up with Wine fo Anile-leeds, or eitner anke two ounces and a nonly epper energy of Spikenard fix drams, of the flower much as is sufficient. Another: Take of Myrrhe five ounces, of Spikenard fix drams, of the flower much as is jumcient. Another: Take of Mayfia four drams, Cinamon three drams, white Pepper of Juness rotundus two drams and a half, Caffia four drams, Confine one drams, white Pepper of Junew rotunum two drams and a nan, Capital and half a feruple, Coffin one dram, make them up one dram and a half, Frankincense one dram and half a feruple, Coffin one dram, make them up one gram and a nant, Frankhiteine one gram and half a long, to be taken either in Mulfe or with Attick Honey: The dose is the quantity of a Hasel nut, to be taken either in Mulfe or water.

Remedies out of Apollodorus.

Take of wilde Cummin two ounces and a half, the bloud of a Sea Tortoise four drams, the rennet of a Fawn or Hare three drams, the bloud of a Kid four drams; make them up with the best Wine, and reserve it to your use: The dose is the quantity of an Olive, in a draught of the best and purest Wine. Another: Take of the seeds of Trifolium Bituminosum, of round Astrologe, the and purest Wine. Another: Take of the seeds of Trifolium Bituminosum, of round Astrologe, the seeds of wilde Rew, the seeds of Ervum dryed in the Sun, of each alike six drams; work them with seeds of wilde Rew, the seeds of Ervum dryed in the Sun, of each alike six drams; work them with seeds of make Trochisces thereof, every one of them weighing four drams: The dose is one Trochisce. Read more in Galen, in his second Book De Antid. where any man may find many for the same purpose, which he had gathered and selected from divers Authors.

Out of Actius, and Paulus Ægineta.

Take of Sulphur Vivum, and of Galbanum, of either four drams, of bitter Almonds excorticated one dram, of the Gum called Benzoin four drams, temper them in Wine, and after their maceration, work them up with fome Honey to be taken nwardly. Being thus prepared, it may likewife be applyed outwardly. Another: Take of Ameor two drams, roots of Flowre-de-luce one dram, or elfe of Saint Johns wort, or Trifolium Biluminofum, drink them out of Wine. Or take of Anife-leeds, wilde Carrets, Cummin, Nigella Romana, Pepper and Agarick, of either one dram, and drink them. Or take the leaves of the Cyprefs tree, or the Nuts beaten in Wine, and three quarters of a pinte of the best Oyl, and give it to drink.

And to this end they do prescribe Bay-berries, Scorpion-grasse, wilde Thyme, Galamint, Chame-pitys, either to be taken by themselves alone, or with Rew and Pepper. Assembly used these that follow: Take of the seeds of Angelica and Calamint, of either alike much, and powned together, to be taken in six ounces of Wine oftentimes in a day. Another: Take of Benzoin, the seeds of the wilde Carret, of dry Mints and Spikenard a little quantity, temper them up with Vinegar: The dos is one dram, with pure water and Vinegar mixed together about five or six ounces. Another more excellent: Take Garlick and eat it, and a bath made of the same with Wine, and likewise all those medicines which do heal the bitings of Vipers, are notable in these cases. Paulus Aegineta commendeth all these very highly, and so doth he the seeds of Agnus Casius, or the leaves of the white Popler.

Out of Nicander.

Take of the purest Turpentine that distilleth out of the Pine-tree, and eat or drink it: for this is a very effectual medicine, which, as Bellonius reporteth, he hath found to be true by experience.

Out of Avicenna.

The fruit of the Myrtle tree, Doronicum, Mastick, Assa Fetida, Dedder, With-winde and his root, the Nut of India, and white Bdellium drunk with Wine. Take of the roots of Aristolochy, roots of Floure-de-luce, of Spike, Pellitory of Spain, the seeds of wilde Carrot, black Hellebore, Cumin, the roots of the true Dassadil, of the fruit of the Carob-tree, the leaves of Dates, top of Pomgranates, Cinamon, of the juyce of Rue, Cray-fishes, Styrax, Opium, and Carpballemum, of either alike, one ounce, all these being powdered, make thereof Trochisces the weight of one dram or four scruples, which is their dose: Take also in Wine the decocion of the

Of the Spider.

the feeds of Trifolium Bituminosum, Cypresse-nuts, and the seeds of Smallage. Besides let him drink the grains or fruit of the Pine-tree, Cumin of Athiopia, the leaves and rinde of the Palne-tree, the seeds of Siler Montanum, black and wilde Cicers, the seeds of Nigella, Southern-wood and Dill, Airologe or Hartwort, the fruit of the Tamarisk-tree: for all these are very effectuall to cure the hurts that come by biting of any venomous Spider.

The juice also of wilde Lettice and House-leek is excellent. The decoction of Cypresse-nuts being boyled, especially with Cynamon, the broth of Crai-fishes, and of Goose-fiesh, and likewise the decoction of the roots of Asparagus in wine and water. Another. Take of Astrologe and Cumin of each three drams to be drunk in warm water: an excellent and approved Antidote. Take of the seeds of Git or Nigella ten drams, Cumin-seed, Daucus-seed (or wilde Carret) of either five drams, Spikenard, Bay-berries, round Aristolochie, Carpobalsamum, Cinamon, roots of Gentian, seeds of the Mountain, Siler, and Smallage, of every one alike two drams, make a Consection with Honey. The dose is the quantity of a Nut with old Wine. A consection of Assa. Take of Assa. Take of Assa. The common dose is one dram, or two at the most in Wine.

Certain other selected Medicines out of Absyrtus, Albucasis, Lulius, Rhazes and Ponzettus.

Take of white Pepper thirty grains, drink it often in a draught of old Wine. Givealso the herb Thyme in Wine. Absyrtus. Let him drink after it a spoonfull of Wine distilled with Balm. Lullus. Take of drie Rue, of Costus, Horsemint, Pellitory of Spain, Gardamornum, of each alike, of Assating feelida a sourth part, Honey so much as is sufficient, commixe them. The dose is the quantity of a Hasel-nut in drink. Albucasis. The brain of a Hen drunk with a little Pepper out of sweet Wine or Vinegar and water mixed together.

A notable Treacle or Antidote against the bitings of Phalangies or venemous Spiders. Take of Tattarum six drams, of yellow Sulphur eight drams, Rue-seeds three drams, Castoreum and Rocket-seed, of either two drams, with the bloud of a Sea tortoise, make an Opiate. The dose is two drams to be taken in Wine. Another. Take of Pellitory of Spain, and the root of the round Ari-stolochie of each one part, of white Pepper half a part, Horehound sour parts, temper them up with Honey, the dose that is to be given is one dram. Another. Take of the roots of Capers, the roots of long Aristolochie or Hartwort, Bay-berries, roots of Gentian, of each a like quantity to be taken in Wine, or let him drink Diassa with sweet strong Wine, Cumin, and the seeds of Agnu Cassu. Another. Take of the seeds of Nigella ten drams, of Dancus and Cumin-seeds, of each alike sive drams, seeds of wilde Rue, and Cypresse-nuts, of either three drams, Spikenard, Bay-berries, round Astrologe, Carpobalsamum, Cynamon, the root of Gentian, seeds of Trisolium Bituminosum, and of Smallage-seed, of either two drams, make a Confection with Honey so much as is sufficient. Give the quantity of a Nut with old Wine. Rbazer.

Out of Plny, Celfus, and Scaliger.

It is good to give five Pifmires to them that are bitten of any Phalangium, or the feeds of Nicella Romana one dram, or Mulberries with Hypociftis and Honey. There is a fecret vertue and hidden quality in the root of Parsley, and of wilde Rue, peculiarly against those hurts that Spiders insect by their venome. The bloud of a Land-tortoyle, the juice of Originum, the root of Behen Album, Vervain, Cinquefoil, all the forts of Sengreen, Cypresse-roots, the Ivy, of Ivy-roots being taken with some sweet Wine, or water and Vinegar mixed and boyled together, are very Speciall in this grief. Likewise two drams of Castoreum to provoke vomiting being relented in some mulse. Apollodorm one of the Disciples of Democritus, saith, there is an herb called Crocides, which if any Phalingium or other poyfonous Spider do but touch, presently they fall down dead, and their poyson is fo dulled and weakned as it can do no hurt. The leaves of the Bul-rush or Mat-rush which are next to the root being eaten, are found to give much help. Pliny. Take of Myrrhe, of Una Taminea, which is the berry of the herb called Ampelos Agria, being a kinde of Bryony, which windeth it felf about trees and hedges like a vine, of some called our Ladies seal, of either alike, and drink them in three quarters of a pinte of sod Wine. Item, the roots of Radish or of Darnell taken in Wine is very effectuall, Celfus. But the excellentest Antidote of all other is that which Scaliger debribeth, whom for his fingular learning and deep conceit, I may tearm Noftri orbis et seculi ornamentum: The form whereof in this place I will prescribe you. Take of the true and round Aristolochia, and of the best Mithridate, for either one ounce, Terra Sigillata half an ounce, of those Flies which are found to live in the flower of the herb called Napellus, in number eighteen, juice of Citrons fo much as is sufficient, mixe them all together. For against this mischief of Spiders, or against any other shrewd turns, grievances, or bitings of any Serpents whatsoever Art, as yet never found out so effectuall a remedy, or so notable an Alexipharmacall. Thus far Scaliger. The juice of Apples being drunk, and Endive, are the proper Bezoar against the venom of a Pholangie. Petrus de Albano. Thus much of inward: Now will I proceed to generall outward medicaments and applications. Five Spiders putrefied in common Oyl, and applyed outwardly to the affected place, are very good. Ashes made of the dung of draught beasts tempered with Vinegar, and used as an oyntment, or in flead of Vinegar, water and Vinegar boyled together, and applyed as before, are proved to be

fingular. Take of Vinegar three pintes and a half, Sulphur vivum two ounces, mixe them, and foment, bath, or foke the wounded part with a Spunge dipped in the liquor, or if the pain be a little affwaged with the fomentation, then wash the place with a good quantity of Sea-water.

Some hold opinion that Achates (which is a precious stone, wherein are represented divers form) whereof some have the nine masts, some of Venu, &c. will heal all bitings of Phalangies, and for this whereor tome have the mine mans, to held at a very deer rate in this Countrey. Pliny. Ashes made cause being brought out of India it is held at a very deer rate in this Countrey. Pliny. Ashes made of fig-tree-leaves, adding to them some salt and wine. The roots of the wilde Panax being beaten or ng-tree-leaves, adding to Barley-meal kneaded together and wrought up with Vinegar. Water to powder, Aristolochie, and Barley-meal kneaded together and wrought up with Vinegar. Water with Honey and falt applyed outwardly for a fomentation. The decoction of the hearb Balm, or with Honey and 1811 applyed to the form of a Pulteffe, and applyed; but we must not forget to the leaves of it being brought to the form of a Pulteffe, and applyed; but we must not forget to the leaves or it being stoughtes to the place agrieved. Pliny. Cut the veins that appear under the use warm bathes, and sometimes to the place agrieved. Pliny. Cut the veins that appear under the use warm pacies, and confine the swelled places with falt and good store of Vinegar: then cause tongue, rubbing and chasing the swelled places with falt and good store of Vinegar: then cause tongue, rupping and change and warily for fear of cold. Vigetim. Theophraftwaith, that practite patient to sweat carefully and warily for fear of cold. Vigetim. Theophraftwaith, that practithe patient to invest carefully and the root of Panax Chironia. Moylen the wound with Oyl, Garlick tioners do highly commend the root of Panax Chironia. Moylen the wound with Oyl, Garlick bruifed, Knot-graffe or Barley-meal, and Bay-leaves with Wine, or with the dregs or Lees of wine, or wilde Rue applyed in manner of a Cataplasm to the wounded place. None. Take of Sulphur Vior wilde Rue applyed in manner of drams and a half, of Euforbium half a dram, Hasel-nuts excorticated two drams, diffolve them, and with wine make towards the curation. Flies beaten to pow. der and applyed upon the place affected. The fish called a Barble cureth the bitings of any veneder and applyed upon the pinte all the first afunder in the middest, and so applyed (as Galen faith) Anoynt mous Spider, if being raw it be slit asunder in the middest, and so applyed (as Galen faith) Anoynt mous spiner, it being taw it Carote, and foment the place affected with Oyl wherein Triflum Bituminosum hath been infused, or bathe it often with Sponges soked in warm Vinegar : then prepare and make ready Cataplasmes of these Ingredients following; that is, of Knot-grasse, scale pare anumant really sales, Cheefill or Bran decocted in Vinegar, Barley meal and Bay-berries, and the leaves boyled in Wine and Honey. Some do also make Cataplasmes of Rue or herb. grace, and Goats-dung tempered with Wine, Cypresse, Marjoram and wilde Rue with Vinegar. An emplaster of Ajciepiades. Take of the seeds of wilde Rue, and Rocket-seeds, Stavesakre, Rosemary feeds, Agnus Caftus, Apples and Nuts, or in Read of these two, of the leaves of the Cypresse. tree, of each alike, beat and temper them all together with Vinegar and Honey. deim. Apply the decoction of Lupines upon the affected place, the eschar being first removed, then anaynt it in the warm Sun-shine, or against the fire with the fat of a Goose tempered with wilde Rue and Oyl, or else of the pap of Barley, and the broth of Lupines make a Cataplasm. Oribasim. The Filberd-nut that groweth in India, healeth the biting of these Phalangies. Avicenna. Goats dung disolved with other convenient Cataplasmes, and Oyl of Worm-wood, and the juice of Figs helpeth much. Kiranides. Apply oftentimes a cold piece of iron to the place. Petrus de Albano. Foment the place very often with the juice of the herb Plantane. Hildegardis.

The artificial Oyl of Balm is singular. Euonymus. A fomentation made of the leaves and salks of Imperatoria called Masterwort, and continued a good space: or else Vervain bruised and samped, the juice being taken in wine, and further, the herb outwardly applyed, is much commended of Turneiser. Beat and stamp herb grace with Garlick and some Oyl, and apply it outwardly. Cellus. There be but a sew particular cures for the bitings of Spiders that Physitians mention; yet some they doe, although the generall be most effectuall. Pliny against the biting of the Fornicaria or Picture-lik Phalangie, that hath a red head, commendeth much another Phalangie of the same surpose, only to be shewed to the wounded patient to look upon, and to be kept for the same purpose, though the Spider be found dead. Also a young Weasel dryed, and the belly thereof stuffed with Coriander-seed, and so kept till it be very old and stale, and drunk in Wine, being first beaten to powder, is likewise good for the same intention.

There is a certain little beaft called Ichneumon, of some it is called Mus Pharaonis, Pharot Moule, and for the enmity unto Serpents, it is called Ophiomachus, (as Bellonius reporteth) being bruideand applyed to the biting of any Wasp-like Phalangie, doth utterly take away the venome of them. It often entreth and searcheth out the seats and holes of venemous Spiders and Phalangiet, and if it finde any of them, she haleth and tuggeth them clean away as a Pismire doth a small grain of Constant if the Phalangie offer any resistance, the Ichneumon sparing no labour, pulleth her the contrary

and if the Phalangie offer any refistance, the Ichneumon sparing no labour, pulleth her the contrary way: and by this strugling and striving, sometimes it so salleth out that the Ichneumon is wearied, and then she breatheth a little, and gathering new strength and courage, setteth again upon the Phalangie with a fresh assault, and woundeth her many times, so that at length she carrieth her to her own lodging there to be devoured.

If the Tarantula have hurt any one, the best remedy is to stirre and exercise the body continually without any intermission, whereas in all hurts that are caused by any other Spiders, rest and quiet-nesse are the best means (as Celsus affirmeth.) But their Antidote is musick and singing.

Christophorus de bonestis counselleth to take forthwith Theriaca Andromachi without any delay.

Christophorus de bonestis counselleth to take forthwith Theriaca Andromachi without any delay.

He also adviseth to take Butter tempered with Honey, and the root of Sastron in Wine. His proper Bezoar (saith he) or the green berries or seeds of the Lentisk-tree. Ponzettus in his book Dev. nie, adviseth to take ten grains of the Lentisk-tree in Milk, or an ounce and a half of the juice of Mullberry leaves.

Muliberry-leaves.
In the increase of the grief, he cureth them with Agarick, or the white Vine: and after much such the increase of the grief, he cureth them with Agarick, or the white Vine: and after much such the increase of the grief, he cureth them with Agarick, or the white Vine: and after much such that it is a such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick, or the white Vine: and after much such that the cureth them with Agarick them with the cureth the cureth the cureth them with the cureth the cureth the cureth them with the cureth the c

Of the Spider.

water of Popy, and the like (Merala faith) they are to be remedied with the Rone of Musicall Infruments, dancing, singing and colours: collecting the three springs I will not contend, but how they should receive any part of help or health from viewing of any colours I do not well understand; considering that the eye-sight of all those that are bitten of a Taramala, is quite taken away, or they see but obscurely, as being mightly deceived in their obserts.

Andress Matthiolus in his Commentaries, upon the fixth book of Dioscorides, Chap. 40. reporteth a very strange story of a certain Hermit, his old friend and acquaintance dwelling steer unto Rome. who cured all chose who were bitten or hurt of any venemous Worms or Serpents, which in this laft place I will infert (although some may say that it is needlesse, and belongesh not at all to this discourse in hand, or else will not beleeve it.) For when as any of the inhabitants in those parts were wounded of any poylonous Serpent, by a Meffenger forthwith fignified the same to the old Hermit; who by and by demanded of the Mellenger, whether he could be content to take or dink any Medicine in flead of the fick patient; which if the other affented to, promifing to take it the Hermit commanded him without any further delay, to pull off his right foot shooe, and to fer his foot on the earth, drawing a line round about the foot with his knife: then he willed him to take away his foot, and within the space of the line so marked, he writ or engraved these worlds following Care Caruze, Sanum reduce, reputata Sanum, Emanuel paratletus. Then immediately he pated away the earth with the fame whittle, so that all the Characters were quite defaced, putting the ame earth into a little earthen veffell full of water, letting it there to long remain, until the earth fink to the bottom: Laftly, he strained the water with a piece of the Messengers shirt, or some other linnen that he wore next to his skin, and being figned with the fign of the Croffe, gave it him to drink . But furely (faith Matthiolw) it was marvellous frange, and a wonderfull thing to confider, how that the wounded patient was perfectly healed, even at that very hour and moment of time, that the Messenger took the aforesaid potion of the Hermit, as it is plainly known unto my felf and to all the people that dwell round about in that Territory or Shire. And thus much of this Heremitical curation by the way.

Now will I come into my path again. A man may finde a great fort both of these, and the like remedies both in Plin, Dioscorides, and other, concerning the hurts of Spiders, but I think I have been a little too tedious; and you may imagine that I do nothing but Ta arachina hyphainein, Aranea rum telus texere: That is, in a frivolous matter and of small moment spend infinite and curious labour; so that I had more need to trave pardon for my long discourse about this subject, wherein though many things may want to the satisfaction of an afflicted and searching head, yet I amburchere is enough to warrant the discharge of my good will, and to repell the censure of the strupulous;

— Nunc inus ad illam Artificem, mens nostra cui est conformis, Arachnem, Quamedio tenera residens in stamme tela Qua ferit carus atrox, trepidet vollitudibus auris Tangitur, urque jono vagus illi bysus als æsits.

Unto Arachne skilfull Mistresse let, us come, To whom conformed seems the minde of man, She sits in middest of web, her tender feet upon:

In English thus;

ne,

whiles she is tost with East-winde now and than,

She trembleth at the noyse of railing winds,

stupon:

As when the humming file hard wagging finds.

Of the Tame or Honfe SPIDER.

A Rishole, that diligent searcher and seeker out of Nature and natural sauses, termeth this kinder of Spider a very gallant and excellent wife creature. King Salomos himself, at whose high wisdome all succeeding ages have and will admire, amongst those four small Creatures, which it wisdom do out first the greatest Philosophers, reckoneth the Spider for one, dwelling (as he saith) it kings courts, and there devising and weaving his inimitable web. The Poets saign that the Spider called Arabhe, was in times past a Mayden of Lydia, who being instructed of Minerva in the canningskill of Embroydery and spinning, grew therein so excellent, and took such a pride in the same, (for you must remember she was a woman) that she shifly denyed, sacing it out in braving wise, that Minerva was never her Instructer, and so arrogant presumptious she was, as that she said not to challenge her Mistresse Goddesse to work with her, if she durst for her ears enter the lift, in all manner of Embroydery, Tapestry-works, and the like.

At which, Mistresse Minerva being netled, and taking the matter in dudgeon, thus to be provoked, and withall reprehending the mayd very that ply for her sawcinesse, in a pelting chase the braketo pieces the wenches imagery work, that was so curiously woven, and so full of variety, with her shitele. The Mayd hereat being fore grieved, half in despair, not knowing what to dee, yielding to passion, would needs hang her self. But Minerus taking compassion upon her, would not have her die forth with, but transformed her into a Spider, hatteing by a fine that there or line.

Atque tea ofice quedem, penile rumen, imprebu, diniby Lexque eadem pana; no fis fecuru futuri, Ditid two generi, ferifado napolibus efto.

In English thus; So live indeed, yet bang, thou woman vile, She said, and let the self same law of punishment Be unto thee and all thy ofspring, while All kindred lafts : fhall not futures thee content.

If any bedefirous to know more of this fable, let him read the famous Poet Ovid, who hathex. It any be desirous to know more of this Metamorphofis, although fomewhat differing from cellently written thereof in the fixth book of his Metamorphofis, although fomewhat differing from cellently written thereof in the lists do write, as Callus Rodoginus, in his 7. book Lellionum Aniiq. this of reiny. The Green besides we was in the Countrey of Actica a certain man called Pholony, Chap. 16. affirmeth, how that there was in the Countrey of Actica a certain man called Pholony, Chap. 10. amrmeti, now that there was the Phalanx, had perfectly learned of Minera the Mili. who had also a Sister named Arachne, and when Phalanx had perfectly learned of Minera the Mili. wno nau and a Shitt manner warlike exercises and offices that belong to a Souldier, and that the had tary Science, and all other warlike exercises and offices that tary science, and an other wat me had likewife infructed his Sifter Asachne in weaving, spinning, and needle-work, they concluded a likewife instructed his Sifter Asachne in weaving, spinning, and needle-work, they concluded a nikewije instructeu ins Silver and Silver and the Goddesse being much displeased with such a shamefull and inmaten between themselves, their fashion, she disfigured them both into the number of creeping cestuous marriage, marring their fashion, she disfigured them both into the number of creeping Creatures, laying this as a just punishment upon them, to be destroyed of their own young ones. reatures, laying time as a june pullifation thefe to be either fables and Canterbury tales, or true. But it is at every mans choice to interpret thefe to be either fables and Canterbury tales, or true

But it is at every mans choice to interpret minde, that Arachne first invented spinning of linnen, historicall narrations: yet most are of this minde, that Arachne first invented spinning of linnen. mitorical narracions: yet more at the medie, which this mayd of Lydia first learned from the Spiders, taking weaving and working with the needle, which this mayd of Lydia first learned from the Spiders, taking weaving and working with the form them for imitation; which no man ought to think to be her first Samplers and patterns from them for imitation; frange, fith the craft of playstering or working things in earth, and the Art. of curing the eyes, was first taken from the Swallowes. The Eagles have raught us Architecture, and men first received the light of Phlebotomie or letting of bloud from the Hippopotamu, which is a beast living in the River of Nilm, having feet like an Oxe, and his back and mane like a Horse, with a winding tayl, and tusked like a Boar. The bird of Egypt called Ibis, first gave knowledge to Physicians how to and cushed that a Boar. The bird of Egyp. Cancer 1997 and Weafels, have taught men many use the Glyster; yea, Dogs, Goats, Harts, Storks, Swallowes and Weafels, have taught men many

medicines for many diseases.

To begin therefore to make an enumeration of their prayles, I will declare unto you, the rich vertues and externall goods of the body, fortune and minde. And first to begin with the good gifts of their bodies. If you will weigh and confider the matter and fubitance of a Spiders body, you shall finde it to be light, partaking much of fire and ayr, (being two of the most nobleand effectuall elements in operation) and having but little earthy dragginesse and drossy refuse. If you behold their figure, they have either a Sphæricall and heavenly, or at least wife an Ovall form, which is next to the Sphæricall, as being the perfecteft of all other. Besides, their substance is thin, fine, gliftering, and fubtile, yea, although they feem now and then to be fatted up with plenty of meat, that they grow as big in bulk as a Walnut, and if the learned Cardan may be credited, they grow otherwhiles as great as a Sparrow: yet for all that, if you cast your eye on then against the light, hanging in their web, she glittereth and shineth on all parts like unto the Chrysolite, which is a kinde of precious stone, shining with a golden colour quite thorow, causing a pleasant reflexion to the eyes, and piercing them with fingular delight.

The colour of a Spider is somewhat pale, such as Ovid a scribeth to Lovers, and when she hangeth aloft in her web, with her legs wide and large spread abroad, she perfectly and lively expresses the shape and proportion of a painted Starre: as if nature had intended to give and beflow on her, not onely the resemblance and counterfeit similitude of heaven, but also the very lustre of the Starres themselves. The skin of a Spider is so soft, smooth, exquisite, pure, clean, and neat, that it farre surpasseth by many degrees, the polished skins of those maids that have the Greensickensse, or those young whores that are so carefull in sparing no cost to preserve their beauties: and it is of such cleernesse and perspicuity, that it will easily represent the visage and physiognomy of any beholder of it, much like unto a fine glaffe. Further, it hath fingers, for all the world fuch as fair Virgins defire to have, that is to fay, long, round, and slender, being also endued with the most exquisite sense of touching that possibly can be imagined, insomuch that it sarre surmounteth any mortall man living, and all other creatures in the world besides, according to that

old and common Verse;

Nos aper auditupracellit, Aranea tallu, Vultur odoratu, Lynx vifu, Simia guftu. Which may be Englished thus; To bear, the Boar, to touch, the Spider me excells, The Lynx to fee, the Ape to talle, the Vulture for the fmells.

It hath also feet, but yet not such a multitude as Scolopendraes have, nor yet none at all, as the meanest rank and fort of Creatures, nor yet fix only, as the common fort of Infects: but it bath eight, a number which the meanest Sophister in Gambridge can resolve, is next to the perfected all numbers, and these feet of the common fort of the perfected of the common fort of the perfect of the common fort of the common all numbers, and these sect confisting of a sesquitertial proportion, which of all Mathematicians is esteemed to be wonderfull and admirable, so that although the hinder be shorter then the fore-less, yet notwithstanding they retain a mutuall harmony, equality, and semblable concordance. Many Philosophers have not deserted as a form that the second as a second as a form that the second as a form that the second as a second as a form that the second as a form that the second as a s Philosophers have not dared to affirm that they are blinde, but they themselves in this popular most blinde. For if they be deprived of their eyes and eye-fight, I would fain be resolved how they could make choice of such apt and convenient places for their hunting trade, and with what guide. Cantain or Directer, they do knit, fasten and tye one thred to another, in such admirable order rank and range, as the excellentest work-men in the world stand amazed at. Or else how they can come to the knowledge when their webs are broken by chance, or have the skill to amend them being either shaken or burst in sunder. Besides, we may all observe by our own experience, that one take a flie, and hold her at the fide of the web, the familiar, tame, or domesticall Spider cloving her, will make all the hafte the can through thick and thin, yea though the be farre off, and will boldly affayl and devour her, and will (as a man may fay) take her out of your hands into her own, which thing I have often feen done. Surely therefore those persons are half blinde, who neither can conceive nor fee, that Spiders can fee.

Now in that a Spider seemeth to some to be an ugly and loathsome Creature, and even at the fift fight to be detefted, in regard it is so mishapen, I will not impute this to any defect or defull that is in their form or proportion, but I rather afcribe it to their exceeding great Melantholy (for this humour is most predominant in them) and to their strange lusting or longing, by reason of naughty humours gathered about the mouth of the stomack, yea, and to their lack of stay and moderation in their lusts and affections. For they are no lesse beholding to Nature for their elegancy, handsome and proper feature, then the Butter-fly, or any other Cut-waste whatsoever, To conclude this poynt, GOD hath given and bestowed upon this strange and admirable body. as strange and admirable a disposition, nature, and constitution of the skin. For a Spider changeth her skin, not once only in a years space, (as Vipers do) but once in the space of a moneth the renewethit, (if the be well fed, and not hunger-starved) and putteth on a new hue and skin, and the

same in all poynts more fresh, exquisite and neat, then the old skin which she cast off.

Amongh the bleffings of Fortune, or rather Fate, I efteem this to be the excellenteft that is conferred upon them, in that they bear about with them an inexhausted matter or substance in their bellves, to make infinite webs, yea, such a matter as can never be consumed, wasted or spent, of which they have such foy son, as they are able to draw out in length and breadth, and to spin and devise innumerable threds and stuffe to make and finish their Cob-webs of, so that it a hundred flies light in them, they are of force sufficient so to entangle and enfnare them all, as they shall never get out again. Furthermore, although they have neither food nor sustenance laid up in Barns or Store-houses, as Pismires have, nor yet any meat set or sowed for them as Bees have, but get their commons only by taking of booties calually, by hunting at all adventures, and by chanceable preys, yet do they fatisfie nature, and expell hunger, by means of that hazardous and fuddain spoyl; and sometimes you shall see them grown very thick, far, and unwieldy, by reason of these good dishes, and fat melles of meat which they can purchase by their own good wary husbandry, or by any means can lay hold on, and catch into their clawes.

Besides, I must tell you that Spiders have not the least benefit of Fortunes favour bestowed upon them, when as being inglutted with Courtly Viands, they have been glad to exchange lodgings with an old Courtier called Podagra, or the Gowt, for it skilleth not whether of these two names you will chuse. For you have heard before, the wife King Solomos to have given them the most prime and chiefest places in Princes Courts, that the might be an absolute pattern and president of wit, wisdome, moderate frugality and vertue, and in divers poynts of regiment they might beour directors for imitation. Further, beginning their Cob webs, they have wholly bent and applyed themselves to their most ingenious weaving trade, they have given themselves to curious and superstitious hunting, to captious taking at advantage, watching and espying their prey, nothing at all fearing any ambuthes, treacheries, traps or treafons, and no whit dreading any affaults, much lesse triumphs: and to speak briefly, the wisest creature of the wisest King, beareth a great froke, domineereth, and hath (I may fay) the fole foveraignty in the most noble, greatest, and stateliest Courts of Princes.

And yet for all these vertues, (fince Solomons time) there have risen up and followed some Princes and Governours, unadvised, desperately naught, and unthrifty, and such as were not well in their wits, and of those it cannot easily be spoken how churlishly they entertained her, how they fent out their proclamations and warrants, to expell the Spider, to cast her down to the earth, tread under foot, undoe and kill, as a night-thief, with beefoms, brooms, brushes and long poles, so that by and by in a trice there flocked certain Furies of hell, (for so I think I may justly term them) rubbing, brushing, spanging, making clean fluts-corners, beating and sweeping together, and whatfoever they found curioully wrought, all that either they swept clean away, or tore all to pieces, so that hardly they could escape the busie beesomes of these quick-sighted and lewd

Surely, miserable was her condition and estate, which in all that abundance of wealth, she only being indigent and bare, detesting idlenesse withall, might not yet be admitted tenant for some short term of time, in some small odde corner, in such large and spacious buildings, nor yet sinde one hole to live at peace in. Again, the great men, the pich majors and penny-fathers, following the example of their Princes and Governours, they in like fort fent packing out of their doors, the Schoolmistresse of all labour, diligence and vertue, and will not permit a web, the very pattern, index, and anathema of supernaturall wildemeto remain untouched.

This same Spider which now we treat of, in times past, (it was when Dogs and Cats could speak, This tame Spider which now we treat on, in the world, they turn all to plain barking took a for now because there are so many languages in the world, they turn all to plain barking took a for now because there are so many sanguages of the following some and so good hap fell into company with my Lady Podagra, long journey into a firange Countrey, and by good hap fell into company with my Lady Podagra, long journey into a strange Country, and by good hardly keep way with the Spider, but lagged although (being none of the best footers) the day in travell, the night approaching although (being none or the ben looters) included ay in travell, the night approach, out lagged still behinde, and having now fpent one whole day in travell, the night approaching that they fill behinde, and naving now ipent one whole them two to betake themfelves to find take up their Inne to lodge in, they refolved betwixt them two to betake themfelves to fundamental them two to betake themfelves to fundamental them. should take up their inne to louge in, they televise to fund y houses; so the Spider entring the Town, took up her lodging in the house of a certain weak dry houses; so the Spider entring the Good that here Tunnes in Townshill Asset here. dry houses; to the spider entring the fign of the three Tunnes in Tower-bill-fireet) where when active (I suppose it was neer the sign of the headen to buckle her file. thy Citizen, (1 suppose it was need the light of the began to buckle her felf to her wonted cording to her usuall manner, hating lewd idlenesse, the began to buckle her felf to her wonted cording to ner muan manner, making leave the wrought work, being suddenly espyed of a comtask, in weaving ner time Tapenty, and company of corner-creepers, spider-catchers, that any of the any reason for her just defence, they to exposulate the matter with her, and not staying to hear any reason for her just defence, they made no more adoe but gave her Jack-drummes entertainment, thrusting her out of doors by the made no more adoe but gave het jackness the could finde it; fo that the lay abroad without head and shoulders, to feek her lodging where she could finde it; fo that the lay abroad without nead and inconvers, to leek the roughly and cold: and all this happened about Saint Nicholas time, doors a whole Winters-night in the rain and cold:

when dayes are at the shortest. nen dayes are at the thortest. Now in the mean space Podagra having none of the best seet, but indeed being somewhat lame. when the could travail no further, the by chance light into a poor Cottage or cabbin of turfs. when the could travail no the Towns end, and yet in this poor fhed fhe could hardly be received, builded with Elder-poles at the Towns end, and yet in this poor fhed fhe could hardly be received, but yet at length, through her incessant solicitation being admitted, the fate down to resher wea. ry bones, so at length, supper being prepared, the tender hearted Lady found course fare, and commons farre shorter and more homely, then ever Lipsius found in Westphalia: the indured all the miseries in the World, that pity it was to see. There was no inselicity, no diffresse, missortune and advertity to be compared unto hers, for there was nothing but a little brown Barley-bread for on the board to sup withall, which this nice piece so much milliked and abhorred, as that at the very fight thereof the was ready to difforge her queafie ftomack, then was there brought fome Cock-crown keal, having no good relish, for they were not seasoned with salt, so that they were in tafte very untoothfome, and when they should drink, they fetcht a little cold water out of a pit or pond, neer adjoyning to the house, in a wooden dish, whereof if Mistresse Podagra had setched but one found carouse, it would have made her run through an Alphabet of faces: but there was no remedy, hunger breaketh stone-walls, and hard need makes the old wife trot, she must either

quench her thirft with that or faft.

Having thus thinly supped, she called for her Chamber, where they shewed her to climbeup a Ladder, (you would have taken it to have been the fleas Ladder) and behinde a corner there was provided a bed stuffed with good Wheat-chaffe in stead of Down, to harden her hide, and under her head a hard Oken-logge, with the Winnow-cloth, and the one end of an old Hop-bag, caltover in flead of a Coverlet, (for the poor man and his wife, thought that none but the Lord of the Town, and women in childe-bed used Pillowes.) But Podagra not knowing how to mend the matter groaned and made a lamentable noyfe, and fetching a thousand fighes the couched her felf down But alas what ill rest she poor heart took that night, and how ill her fost and tender limbs agreed with fuch cold cheer and entertainment, I referre my felf to your secret thought. So soon thereforess the day began to break, the started up, and the Spider and the met together again at the appointed time and place: and first of all the Spider began much to complain of the incivility of the rich Chuffe his hoft the Citizen. Podagra contrary-wife found as much or more fault with the flort and tharp commons, this diet, miferable poverty, and indigency of his poor, bare and lean holl, shewing her black and blew marks and prints, into whose tender skin the boards and planks had made a deep impression. For which cause, being both much discontented, after the matter wis throughly debated betwixt them two, they determined and refolved within themselves, that the night following they would change Hostes and Innes, that is, that the Spider should enter into some poor Cottages, or houses of poor men, and Podagra should bend her course unto Noble and great mens houses, to Kings Courts, and Princely Palaces, to see what good was to be done there. So Podagra not being unmindfull of her word, went with a fine and Snail-like pace to the house of a certain fat, rich, and well monied man, and quietly laid herself down at the set of this corfie Sire: which as foon as the gentle Host cast an eye upon, it is strange to tell with what mildeness, with what allurement and gentle intreaty, with what promptitude and slacrity the was welcomed; they prepared foft pallats of Down for her to lye upon, the Bedleds and the Settles whereon the thould rest, were covered with Pillowes, foft Cushions, and Carpets of Persia, the Kitchen smokes, and all things are in a readinesse to give her a most friendly wellcome. According to the words of the Poet, where he faith;

> Tam dapibus menfas oneraut et pocula ponunt. In English thus; Spread are the tables, and laded with ftore Of delicates, the Cups filled, could receive no more.

Briefly, he was in all points for person and provision such a one as Chaueer in his works describeth his Fraklin to be:

White was bis beard as the Duifie. And of complexion be was fanguine. Well level be by the morrow a fop in wine : To liven in delight was ever bie won, For be was Epicures own fon. 10.32 That beld opinion that plain delight. 2.0.3 Wa very felicity parfire.
An boulholder and that a great was be Saint Julian be was in bie Countree: His brend, bis ale, was always after one, Abetter viended man wie nover none. Without bake-meat was mever bis boufe.

Of fift and fleft, and that so pleateouse, It inewed in his boufe of meet and drink, Of all dainties that men could think. After the fundry feafons of the yeer. So changed be bis meat and bis suppere. Full many a fat Patrich bad he in mue. And many a Bream, and many a Luce in fine. We was his Cooke, but bis fance ever were Poynant and (barp, and ready all bis gere. His table dermannt in bis Hall alway, Stood ready covered all the lone day,

Nav, hither they brought fat and crammed Capons, Pheafants, Quails, Turtle-doves, Larks, and Nightingals. I passe over Turbot or Byrt, Gilt-heads, Sturgion, Salmonds, Soals, and the like. for they were not unfurnished of all these, and of other store of shell-fish, as Lobsters, Crevishes. Oufters, and what foever the Sea yeelded that might by love or money be purchased: for I will not foesk of a great number of River-fifth and Fouls that are to be had about Peterborow, Wittlefey-mare. and those Fennish Countreys, for thither he sent his people to purvay for him all that was rare and dainty. Here was Red-wine, White, Claret, Muscadell, Rhenish, sweet-wines, harsh-wines, wine of Falernum, of the Mands of Creta, Chio, Madera, and those that are called Baleares, lying heer unto the Coast of Spein.

To speak nothing of their rear-suppers, their fine Marchpanes, and curious Consections, made with fundry devices, and exquisite skill of the A pothecary. And to conclude, there was no wanton fare unfought for, no delicate Juncate, no curious trimming and pickedneffe that might gratifie, no fair words, and pleasant enticements fit to draw and allure, nor no delectation whatfoever omitted, that might feem to please this great Lady Podagra, (for you must understand the was none of the courfelt fort of Ladies, whereof there be many now adaies, for all men know the was a Gen-(lewoman born, both by the fathers and mothers fide, as being the daughter of Bacchus and Venus) and all this, I fay, was done to please both her, and her two sweet Silters, Chiragra and Congra, pox take them all three, and fo I will let them go, and come to the Spider, who likewife being directed by some favourable Planet, boldly and luckily trudged to the poor mans house. राष्ट्रिक करा । Harab

Atque ibi miro Dogmate, quidve marem deceat, deceatque maritam Addocet, atque suo sese sudore saginat. Which may be Englished thus;

And there by strange instructions and documents, She teacheth male and female bow to live, That is, both man and wife bow to increase their rents, Whilst she, on her own sweat and fat deth thrive.

But some man may here object and say, I see here no such great blessings of Lady Fortune, more then belides a bare commendation, and good hap in this their exchange of lodging and lodgers. Yes furely, very much, not only because the spendeth her dayes more freely and safely from danger, but also because as out of a high watch-tower, she no longer beholdeth in the houses of poor persons, lavish and needlesse prodigality, banquettings, quastings, rioting, playes, dancing, dicing, and whoring, and a thousand vanities and villanies besides, whereof she knew her self conkious, and a privy wirnesse unto, whilst she lived in the Halls and Bowers of the rich and wealthier fort; who when they had thrust clean from house and home, and for ever banished the Spider, (the true School-mistresse of industry and frugality) straightwayes the lazie Gowt called Podagra, arrefled them. Had it not been better for them (think you) to have granted a dwelling place to a saving, wife, prudent, and harmlesse little creature, then to have given entertainment to such a lafe, blockish companion and guest as the Gowt is? Let not therefore, rich, covetous men wonder, if many times they be cormented with this fore grief, fith they will neither admit true Physitian nor physick, I mean, travail, diligence, industry, moderation, and pains-taking, with the like.

Now to touch the rich and rare gifts and graces of the minde, and other noble qualities and dipolitions of Spiders, I know not whether I should first begin with the commendation of their prudence, justice, fortitude, temperance, their Philambropia, Philoponia, Autarkeia, their humanity and love towards men, their studious industry and love of labour, their contentation as having sufficient, and coveting no more then is allotted unto them. Their wittinesse, policy, quickness and harpnesse of sense, their cleanly peatnesse, with many other vertues, or else her admirable cunning and skilfulnesse in their weaving trade. Their prudence, sagacity, and wittinesse to conjecture things future, appeareth in this one thing, that when great abundance of rain, flouds, swelling and overflowings of Rivers, are like shortly to come to passe, and thereby to threaten houses, they then begin to build their Webs higher by a great deal, then their usuall custome heretofore hath ben. And this is another proof of the same, in that they weave not at all in a clear Sun-shine-

territoria. Territoria

15 17 1

day, or when it is fair and calm weather, when Flies are most busing in flying about to and fro, that they may be the hetter, at leasure to give themselves to hunting and watching after them, to take they may be the hetter, at leasure to light into their riets, forthwith to some upon them for their repast, advantage, and it any chance to light into their repast, and it any chance to light into a down they with their Cobwebs first of all fall and any control of the source of

Again, when houses are ready to drop down, they with their Cobwebs first of all fall, and get them away packing, after their climate to some other surer place and dwelling to red. in. If any thing touch her body that is hard on painfull, she immediately draweth up her legs round on a heap, for this end as Lthink, to feel the lesse pain, and the better to provide foothe health and heap, for this end as Lthink, to feel the lesse pain, and the body a for if any other part be hurr, the facty of her head, the directer and governer of the whole body a for if any other part be hurr, the can easily cure it. Who hath manifested and made known this unto them? Hath any obliden Starcan easily cure it. Who hath manifested and made known this unto them? No cergazer, or sigure, slinger, by the sight and position of the starces shewed its unro shep? No cergazer, or sigure, slinger, by the sight and position of the starces shewed its unro shep? No cergazer, or sigure, slinger, by the sight and softened in the spider, and as that samous Poetstrike hath chew that which is hurtfull, which is dissured into the Spider, and as that samous Poetstrike hath excellently described.

Spiritue intess alit, tetesque infusa per artus eded a la bodita.

Mens agitat molem.

In English thus;

Minde bred within, insused in all limbs, will to reduce the bodies lump, and skins.

Only 10 reduce the bodies lump, and skins.

Furthermore, to food as they elpy: their enemy, to be caught in their nets, they do not first of all bite and prick him to death in any hostile manner, but they seem with their seer gently and soft-ly to stroke him, yeareven to intreat and allure him, with tickling, and si it were expring and colling, until they have throughly infinated him within their clammy and viscous glis, and being ling, until they have throughly infinated him within their clammy and viscous glis, and being at length wearied, simmoiled, and sired with strugling and striving in vain, the filly flie made at length wearied, simmoiled, and sired with strugling and striving in vain, the filly flie made at length wearied, simmoiled, and sired with So having made sure work with one; the hyein her to unable either to get away, sir, or resist. So having made sure work with one; the hyein her to unable either to get away, sir, or resist. So having made sure work with one; the hyein her to be so the sure of her web, observing and prying whether any new preprint the sure of hard significant hours of the web the sure of t

They only fred on the juice of Flies, and the dry Carkafe without any movilure they call away ab unprofitable fluffe to be used about any butmeffe Moreovery because the Female Spide is fometimes greater then the Mule, therefore the chufeth her Randing in the lower part of the Web, that the poor Flies may feem careleffe of her, yet is the very observant, taking great heed to them: for they feeing her hanging below, thinking themselses do fly up into the upper part of the net, but by this means feeking to thun Charybdia, they fall into Scilla, out of the smoke into the fire : for though in regard of her bodies magnitude, the be unwieldy, and very unfit to bestir her self in this hunting office: yet the crafty Male Spider playing Bo-peep, and pretending fome other businesse, though minding another, playing the diffembling Mypocrite, hideh himself in the top of the Web, noting well all occurrents, and being feen of no Body, there he lurkethill fome fish (as we fay) come to his net, and having espyed his prey, being more light, quick, and lively, it is a wonder to fee how diligent, vigilant, and earnestly bent he is to bend his course with all expedition toward this new offered booty; for there he will not fuffer it very long to remain, but descending in a trice, Euro velocite, as quick as a Bee from the upper to the lower part (as I have faid) of the Cobweb, he maketh a very quick dispatch, and having royally featled himself, he referveth and layeth up all his other enemies in one place, hanging them all by one ofhisown threds till fome convenient time to feast himself again withall. Then again when as by reston of long continuence and length of time, the Webs have lost their binding viscosity, and tenacious substance, either the Spider unweaveth them again, or else confirmeth and new strengtheth them afresh as it were, with another new glutinosity, or fast-binding clamminesse. This their work being finished, they either contain themselves in the center of it, or keeping sentinell and warding in the upper part, they hold as it were in their hands a thred drawn from the middelt or center, by which they have easie accesse and recesse to and fro to their beguiling nets; and withall this thred ferveth to another profitable use, for if any prey be intangled, by the light moving and firring of it, they presently feel and perceive it. But yet to make fure work, left she should winde down in vain, or take bootleffe labour about nothing, the draweth back the thred alittle now and then, and by the motion and poize of it, the putteth all out of doubt, being fully skertained of the truth.

Then first, with all celerity possible she hies her to the Center, which thing the silly slies being fast, and having some sense and seeling (as it should seem) that they are taken tardy, and for deeming some hurt, are as quiet as a Mouse in a trap, making no noyse at all, lest either they might be wray or betray themselves, and so be suther enfolden in danger. But alasse in vain doth he avoyd ware, that cannot enjoy peace, and bootlesse doth he shun pain, that hath no means to see warre, this availeth but little, for they are not able with all these fetches to deceive their sharp inquistors, for both with eyes and seet, they finely and quickly run unto them, making a clean riddance and quickly single so them ever the

and quick dispatch of them every one.

But yet it is more to consider what great justice and equity is observed to be in Spiders: For there
is not one of them so ill bent, so make pertly sawcy, and impudently shamelesse, that can be seen to
jay

lay claim unto, or to take away anothers wife or mate: there is none that intermedleth with anothers substance, businesses, on weaving; every one liveth contented by the sweat of his own browes, by their own proper goods and industrious pains-taking procured by their own bodily labour: so that not one of them dare enter his Neighbours freehold, but it is accounted a hainous matter, and very unlawfull, not one dare be so knack-hardy as to break into their friends and sellowes fence and enclosure, but it is even detested as a wicked and cursed deed.

Non its mortales, quos (prob dolor) urget habendi
Tantus amor, domibus domus, arvis additur arvum,
Monitculus monti, maribus mare, sique potessint
Addiderini mundum mundo, suaque omnia dixint.
In English thus;
Then would not mortall men so farre ingaz'd in love to bave
(A death it is to think) house to bouse, and land to land to lay,
Hillock to bill, sea unto sea, to adde they crave,
And if they could, world unto world, and all their own would say.

Again, they spread not their gins and nets to entrap and deceive good Creatures, and such as serve for mans use and benefit, but for Wasps, Horse-slies, or Gad-bees, and Brimsees, or Oxe-slies, that in Summer-time vexe Cattle, for Drones Gnats, and other Flies, which to us are like to Theores, Parasites, Bawds, Panders, and such Merchants that bring whores and knaves together, being Tellwin invite pondus, an unprofitable burthen of the earth, serving to no good use. And besides, being a vermin of singular and incomparable courage, she dare adventure to give the onset upon those young Serpents that are called Lizards, who if they offer to contend and strive against her sury, she quickly enclasses them round about, and very nimbly and eagerly seizeth upon both their lips, biting and holding them together so saft, that she never giveth over till they be dead: and at length having vanquished her enemies, she like another Caese carrieth them in her Cave, or some secret corner.

Now if it happen in this hot bickering, that the nets be either broken, intangled, or platted together, by and by without further delay the falls to mending what was amiffe, to unwinde, foread open, and to fet them again in due order and frame very ingeniously. What say you to this ? That the Spider beareth a deadly feud and mortall hatred to Serpents: for if so be the Serpent at any time lie in the shadow under any tree to cool himself, where Spiders do resort, some one of them levelleth directly at him, descending down perpendicularly to the Serpents head, and with such a violence striketh and dasheth at his head with her beak or snout, that her enemy withall making a whizzing noyfe, and being driven into a giddineffe, turning round, hiffeth, being neither able to break afunder the thred that cometh from above, nor yet hath force enough to escape it. Neither is this spectacle or pageant ended, untill this our champion with her battering, hath sent her life to Pluto, the God of Hell for a prefent. Let men therefore be filent, and cease wondering at the amphitheatricall fights of the Romans, which were made with seats and scaffolds to behold Playes and fights, and where were presented to the Specators the bloudy fights of Elephants, Bears, and Lions, fithence a small Spider dare challenge to the field, and fight hand to hand with a black and blew Serpent, and not only to come down to him in daring wife, but also victoriously to triumph over him, entirely possessing all the spoyl. Who would not marvail that in so small, or in a manner no body at all, which hath neither bones, nor finnewes, nor flesh, nor scarce any skin, there could be fo great force, such incredible audacity and courage, such sharp and hard bitings, and invincible fury? Surely we must conclude necessarily, that this cannot proceed altogether from their valiant stomacks, but rather from GOD himself: In like fort, they dare buckle with Toads of all forts, both of the land and water, and in a fingular combate overthrow and destroy them, which thing not only Pliny and Albertus do recite and fet down for a certain truth, but Erafmuallo in his Dialogue entituled De Amichia, maketh mention of, reporting how a certain Monk lying fast asleep, on whose mouth a foul Toad sate, and yet by the Spiders means was freed from all hurt. Yea, they dare enter the combat with winged and stinged Hornets, having not soft but fiffe bodies, and almost as hard as horn, who although she many times breaketh through their Cobwebs with main strength (as rich men undoe and make a way through Lawes with Gold, and by that means many times scape scot-free) yet for all that, at length being over-mastered, hand to hand in fingle combat, and intangled and infnarled with the binding pattineffe, and tonacious flewish substance of the Web, she payeth a deer price for her breaking into anothers house and possession, yeelding at length to the Spiders mercy.

I will not omit their temperance, a vertue in former ages proper only to men, but now it should seem peculiar to Spiders. For who almost is there found (if age and strength permit) that contentes himself with the love of one as he ought, but rather applyeth his minde, body, and wandering affections to strange loves? But yet Spiders so soon as they grow to ripenesse of age, do choose them Mates, never parting till death it self make the separation. And as they cannot abide Cortivalls, if any Wedlock-breakers, and Cuckold-makers dare be so snappish to enter, or so insolently proud as to presse into anothers house or Cottage, they reward him justly

with condigne punishment for his temerarious enterprize, and flagitious sack: First by their cruell bitings, then with banishment or exile, and oftentimes with death it self. So that there is not any one of them, that dare offer villany or violence to anothers Mate, or seek by any means unlawfully to abuse her. There is such restraint, such strict orders, such faithfull dealing, uprightnesse of conscience, and Turtle love amongst them. Further, if you look into their house-keeping, you shall finde there is nothing more frugall then a Spider, more laborious, cleanly, and fine. For she cannot abide that even the least end or piece of her thred to be lost, or to be placed and set to no use or profit, and they ease and relieve themselves by substitutes, that supply their rooms and take pains for them: for whilest the Female weaveth, the Male applyeth himself to hunting, if take pains for them fall sick and be weak, then one of them doth the work of both, that their merits either of them fall sick and be weak, then one of them doth the Male is busic about Net-maland deserts may be alike. So sometimes the Female hunteth whilest the Male is busic about Net-maland, if the one stand in need of the others help and surtherance.

ng, it the one trains the Female-Spider being instructed of her Parents when she was young and do. But yet commonly the remark of plant in a woung (which custome was amongst us also in times past) begin. neth the Cobweb, and her belly is fufficient to minister matter enough for such a piece of work, whether it be that the nature or fubfiance of the belly groweth to corruption at fun-fet and appointed time (as Democritus thought) or whether there be within them a certain langerous fertipointed time (as Democrates and Arifotle is of opinion, that the matter is outward as it wereacertain Shell or pill, and that it is unwound, loofened, and drawn out by their fine weaving and spintain one or pin, and that is, certain it is, they will not by their good wills lose the least jot of a threds end, but very providently fee to all though never fo little. The love they bear to their young breed is fingular, both in the care they have for their fashioning and framing to good or ders, and for their education otherwise, for the avoidance of idlenesse. For the Male and Female do by turns fit upon their Egges, and so by this way interchangeably taking courses, they do stirre up, quicken, move and encrease naturall and lively heat in them, and although it hath been sun. dry times observed, that they have brought forth three hundred young ones at once, yet do they train them up all alike without exception, to labour, parfimony, and pains-taking, and inure them in good order, to fashion and frame all things fit for the weaving craft. I have often wondred at their cleanlinesse, when to keep all things from nastinesse or stinking, I have beheld with mineeyes those that were lean, ill-favoured, and fickly, to come glyding down from the upper to the lower part of their buildings, and there to exonerate nature at fome hole in the Web, lest either their shop, work-house, or frame might be distained or annoyed. And this is sufficient to have spoken of their politicall, civil, and domesticall vertues: Now will I proceed to discourse of their skillin weaving, wherewith Pallas was fo much offended : for the Scholar excelled her Miltres, and in fine, cunning, and curious workmanship, did farre surpasse hers. First then let us consider thematter of the Web, whose substance is tough, binding, and glutinous, pliant, and will stick to ones fingers, like Bird-lime, and of fuch a matter it is compounded, as it neither lofeth his clamminesse and fast-holding quality, either by ficcity or moysture.

The matter whereof it is made, is such as can never be consumed, wasted, or spent, whilest they live, and being so endlesse, we must needs here admire and honour the never ending and infinite power of the great God: for to seek out some naturals reason for it, or to ascribe it to natural causes, were in my minde meer madnesse and folly. The Autumnals Spiders, called Lupi or Hisi, Wolves or Hunters, are thought to be the most artificials and ingenious: For these drawout a thred finer and thinner then any Silk, and of such a subtilty, that their whole Web being solded together, will scarce be so heavy as one fine thred of Linnen being weighed together. Edwards Monimius hath very finely and eloquently described both the Males and Females, Heptam. Ib. 7. in

these words following;

Ille domum venatu pascit, at ista Maconio graciles orditur tegmine telas. Stanniparus venter, vomissius lanifer, issi Palladiam cumulatque colum, calatosque ministrat. Issim est squam pondus, quod sila trabendo Nellit & intorquet parlit sub tegmine dulla. Illa suam à mediu orditur Dadala telam, Et gracili tenues intendit siamine tralius. Tela iugo junita est, stamen secenit arundo.

Inseritur medium radiu subtegnen acuia, Atque oram à centro panum sibi saminat illum, Pervia tela patet gemina de parte, fetsi Ne concussa euro frangantur stamina, quoque Musca volax tenui stretur sinuamine cessit, Reticuli primam vix muscula contigit oram. Mors abit in tela centrum, ut discrimine paro Vinciat ipse suo peregrinam casse vulutem.

Which may be Englished thus;
The Spider-male by bunting game the houses charge doth feed,
The semale with Maconian art begins to spin sine thred,
Out of Web-breeding helly, breast woolly, upcasting twine,
Whereto the distasse she applies by art of Pallas sine:
To her belongs the pressed weight, which doth the teal out-draw,
Both matter, art, and substance, she doth shield by natures Law.
Like Dadala out of her middest, her web she dath begin,
And stretching out her tender worke, by pressing it full thin:

The which is joyned as in yoke, yet parted by a cane, And planted is the middle roof in a sharp beamy frame. And from the Center draweth a thred like wooll to tye upon. While double work on every part doth fortific her wone: Wherewith the blasts of Eastern winde unbroken web resists. And tender sty infrarled, is fallen into those lists. While scarce upon the edge or brim this little File doth fall, But by and by death selecth her within webs center thrall: And so the stranger winged File with little or no adoe, She overcometh speedily when it the nets comes to.

Of these Cobwebs there is great diversity, variety and difference: for some of them are loose, week, stack, and not well bound; other contrary-wise well compacted, and close couched together, some triangular, othersome quadrangular; and some are made with all sides equall, but yet not right angled or cornered like a quarry of Glasse; others are made of such a form as will best sit the place where they hunt, you shall perceive some of them to be orbicular, if they weave between two trees, and you shall sinde this fashion also among weeds, and oftentimes in Windowes hanging together with many lines and different crosse pieces: so that herein no man can deny but that they shew forth great reason, wisdome, admirable judgement, and much gallant beauty worthy togetto.

Surely Euclides that famous Geometrician, who was Scholar to Socrates, and lived in the time of Ptolemy the first, need not be ashamed to learn from Spiders the drawing of divers of his figures and Geometricall proportions. And Fisher-men also from them have been glad to learn the trade of Net-making. For from whom else could they borrow and fetch such lively representations, and such expresse patterns, then from such a skilfull and industrious School-master. But the strength of the web seemeth to be very strange; which although it seemeth to be the most weak of all other things, yet we see it is able to hold Hornets, and to endure the surious blass of raging windes, and if one throw or cast dust upon it, the same will rather be distended and stretched, then either undone, broken, or felled down.

And yet this is the frangest of all, which many a man would think impossible but that it cannot be called in question, in regard we may daily see and observe the proof thereof cometh to passe, that a Spider should begin to place the one end of her thred on the one side of a little River or Brook, and how she should fasten the other end on the other side of the water, considering that Nature never taught them the art either of slying or swimming. I would sain be resolved of this scruple, by what means they sayl and passe over. Or do you imagine that they jump over, or convey themselves over in a leap? Surely I dare not say so, I much doubt thereof, I will not stand to it.

The next that best deserveth to be marshalled in the second rank and place, for cunning work in weaving and spinning, be those kinde of Spiders who build and labour about the rasters of Houses, in Cellars, shoors, and about boards, planks, and such like, and of these some are wilder, which do sashion and dresse a broad, thick, and plain web in the grasse and fields all about, stretch-

ing out the same like a sayl, or some fine spread Sheet or Curtain.

If you would duely look into their work, and throughly confider the strange trydles of their Looms, the Shittles they use, their Combes to make all clean, the stay of their Looms wherewith they dresse their Webs, their Crosse-lines, the frame, Wouf, their fine spinning-stuffe, and so their whole Cobwebs, you shall therein very plainly behold the singer of God working in his poor and weak Creatures. And questionlesse in this excellent mystery they are able to put down. and farre furmount the Egyptians, the Lydians, Penelope, Tanaquil (who was Wife to Tarquinim Prifem) Amfiris that famous Queen of Persia, Claudiana, Sabina, and Julia, Noble Roman Ladies, and all the Queens of Macedonia, who were esteemed and renowned throughout the whole world, to be the most curious and exquisite in this kinde of faculty, and who in needle-work, Tapestry, and all Embroydery, were thought to be Peerlesse. For these Spiders (even contrary to all reason and Art, as we think) make a firm, strong, and well compacted Web with no lines or threds drawn troffe-wife or overthwart, but only made out and continued fill in length. When their work is perfected and brought to an end, they lay over it and cover it round about with a certain glutinous kinde of Jelly, or flimed juice, by touching of which their prey being entangled, pay full deerly for their ignorant raffinesse, unadvised heed-taking, and lack of fore-sight. Their Web is of the colour of the air, or rather none at all, which easily deceiveth the foolish unwary Flies, and fuch as be quick-fighted, circumfpect, and can efpy things very quickly. For if it did reprefent any notorious and manifest colour, they would provide in time against such dangerous deviics, and take heed of fuch traps aforehand.

The baser and vilder fort of Spiders, and such as be least reputed of, are those that live in boles, Caves, and corners of Houses, and these in respect of the former are slow, slothfull, and lazy, fat, grosse, and big-bellyed corner-creepers, and these spin a very homely, rough, and course three, which they spread abroad, and set before the hollow places and chinks of Walls. These kindes of Spiders have a more heavy and ponderous body, shorter seet, and more unhandsome

Tы

. .

to work or finish any Webbes in their Looms, and as for separating, dividing, picking, carding, or suring their stuffe, they are very Bunglers to the sing mentioned.

futing their itune, they are very bunglets actually, then take any great pairis to feekfare. They apprehead and take their preyes rather cafually, then take any great pairis to feekfare for it, because their hole being great outwardly, feenieth to be a good and convenient lurking-for it, because their hole being great outwardly, feenieth to be a good and convenient lurking-for it, because their for files, to hide themselves in: but being entenged and arrested in the very entry, they are friatched up suddenly by the waschfull Spider, and cerved away into the more very entry, they are friatched up suddenly by the waschfull Spider, and cerved away into the more very entry, they are friatched up suddenly by the waschfull Spider, and cerved away into the more wasch and ward aloft in high inward places of their dens, there so he slaughtered. For they wasch and take them at unaward places of their dens, there so he slaughtered. Birds as lye in wait to intrap and take them at unaward, as Sparrowes, Robin-red-breasts, Wrens, Mightingales, and teledge-Sparrowes, which wares, (as Sparrowes, Robin-red-breasts, Wrens, Mightingales, and teledge-Sparrowes, which wares, (as Sparrowes, Robin-red-breasts, Wrens, Mightingales, and teledge-Sparrowes, which wares, (as Sparrowes, Spiders: and besides, the more easily to beguite the filly slies suspecting

There be certain other forts of Spiders, which as yet I have not described: as for example; there is one (the greatest of all that ever I saw) which spreadeth her actificial nets in the Harvest time amongst the leaves and branches of Roses, and entangleth either any other little Spider that is running away, or else Gnat-flies, and such sike, being caught at unawares, and hanged by that is running away, or else Gnat-flies, and such sike, being caught at unawares, and hanged by that of thred, whom she first pursueth and sayeth hold on with a wonderfull dexterity and quicknesse: and being sast hanged, and so made sure, the there leavest them, for the satisfying of quicknesse: and being sast hanged, and so made sure, the there leavest them, for the satisfying of this Spider is in colour somewhat whinsh, her hungry appetite till another time. The body of this Spider is in colour somewhat whinsh, her hungry appetite till another time. The body of an Oval-figure, the head very little, placed under her belly, being withall crooked or bending like hooks, as is to be seen in the Crab-fish, and

her back garnished with many white spots. er pack garming with the state of Autumnall Lupi, or Wolf-Spider, which in a very thort space of time do grow from the bigneffe of a little Peafe, to a very great bulk and thickneffe. There are alfo found in all places of this Countrey, long-legged Spiders, who make a very homely and diforderly Web. This sinde of Spider liveth altogether in the fields, her body is almost of a round figure, and fomewhat brownish in colour, living in the grasse, and delighting in the company of Sheep and for this cause I take it, that we English men do call her a Shepheard, either for that she keepeth and loveth to be among their flocks, or because that Shepheards have thought shose grounds and feedings to be very wholesome wherein they are most found, and that no venemous or huntfull creature abideth in those fields where they be: And herein their judgement is to be liked, for they are indeed altogether unhurtfull, whether inwardly taken, or otherwise outwardly applied; and therefore because I am tyed within a Teather, and thereby reftrained from all affectionate discourling or dilating unlesse of poysonous and harmfull Creatures, I will come into my path again, and tell you of another certain black Spider, that hath very short feet, carrying about with her an Eggess white as Snow under her belly, and running very swiftly: the Egge being broken, many Spiders creep forth, which go forth with their dam to feek their living al together, and climbing upon her back when night approacheth, there they rest, and so they lodge.

In rotten and hollow trees there are also to be found exceeding black Spiders, having great bodies, short feet, and keeping together with Cheeselips or those greeping vermine with many see, called of some Sower. We have seen also (saith the learned Gesuer) Spiders that were white all over, of a round compact and well knit body, somewhat broad, living in the flowers of Mountain Parsey, amongst Roses, and in the green grasse: their Egges were little, slender, and very long, their mouth speckled, and both their sides were marked with a red line running all alongest. He took them to be very venemous, because he saw a Marmoset or Munkey to eat of them, and by eating thereof hardly to escape with life, yet at length it did well again, and was freed from surther danger, only by powring down a great deal of Oyl into his throat. I my self have also seen son spiders with very long bodies and sharp tayls, of a blackish or dark red colour, and I have noted other some again to be all over the body green-coloured. I will not deny but that there are many other forts of Spiders, and of many more different colours, but I never read, or yet ever sw them: Neque enim nostra fert omnia tellus, The ages ensuing peradventure will finde more.

I will only put you in remembrance of this one thing worthy to be observed, that all wearing and Net-making Spiders, according as they grow in years, so do they acquire more knowledge, and attain to greater cunning and experience in their spinning trade: but carrying a resolute and ready will to keep both time and measure with that Musick which best contents most ears, I will now past to speak of the propagation and use of Spiders, and so I will close up this discourse.

The propagation of Spiders for the most part is by coupling together, the desire and action whereof continueth almost the whole Spring-time, for at that time by a mutuall and often drawing, and easie pulling of their Web, they do as it were wooe one another, then approach they neering, and lastly are joyned with their hippes one against another backwards as Camels do, er together, and lastly are joyned with their hippes one against another backwards as Camels do, for that is the most fit for them, in regard of the round proportion and figure of their bodies. In like fort do the Phalangies joyn together, and are generated by those of the same kinde, (as Arisonle saith:) But the Phalangies couple not in the Spring-season, as the other Spiders doe, but together, at what time they are very swift, quick, nimble, and of most certain hurs, more wards Winter, at what time they are very swift, quick, nimble, and of most certain hurs, more dangerous, and more venemous in their bitings. Some of them after their coupling together, do lay one Egge only, carrying it under their belly, it is in colour as white as Snow, and both Make and Female sit upon it by turns.

Some Spiders do exclude many licele Bigges very like unto the feeds of Poppy, our of which it hath been observed, that sometimes there have been hatched three hundred Spiders at one time, which after their vain and idle plying and sporting together in their web, at length come forth with their Dam, and towards ovening they all trudge home, until each one hath learned, and perfectly attained to the skill to spin his own web, that therein he may spend the residue of his days in more pleasure, case and security. They make exclusion of their young breed in hopping or skipping wise, they fit on their Egges for three days space together, and in a moneths space their young ones come to perfection. The domestical or House-spider, layeth her egges in a thin web, and the wilde-spider in a thicker and stronger, because they are more exposed to the injuries of windes, and lie more open to the rage and sury of storms and showers.

The place and Countrey where they are, helpeth much, and is very available to their generation. There is no Countrey almost, but there are many Spiders in it. For in the Countrey about Arrha, which is in Arabia falix, there is an infinite number of them to be found, and all the Island of Candie swarmeth with Phalangles, Strabs saith, that in Ethiopia there be a great number of Phalangles found, of an exceeding bignesse: although as Pliny saith in his eight Book and 58 chapter, there are neither Wolfs, Foxes, Bears, nor no hurtful creature in it: and yet we all know that in the Isle of Wight (a member of England,) the contrary is to be found, for although there were never dwelling in it Foxes, Bears, nor Wolfs, yet there be Spiders enow.

The Kingdom of Ireland never faw Spiders, and in England no Phalangies will live long, nor yet in the life of Man, and neer unto the City of Grenoble, in that part of France which lyeth next Italy, Gundentius Merula faith, there is an old Tower or Caftle standing, wherein as yet never any Spider hat been seen, nor yet any other venomous creeping creature, but rather if any be brought shither from some other place, they forthwith die. Our Spiders in England, are not so venomous as in other parts of the world, and I have seen a mad man eat many of them, without either death or deaths harm, or any other manifest accident or alteration to ensue. And although I will not deny, but that many of our Spiders being swallowed down, may do much hure, yet notwithstanding we cannot chuse but consesse, that their biting is poysoalesse, as being without venom; procuring not the least touch of hurt at all to any one whatsoever; and on the contrary, the biting of a Phalange is deadly.

We see the harmlesse Spiders almost in every place; they climb up into the Courts of mighty Kings, to be as it were myrrors and glasses of vertue, and to teach them honest prowesse and valuation. They go into the lodgings, shops and Ware-houses of poor men; to commend unto them contenuent, patience, labour, tolerance, industry, poverty and frugality. They are also to be found in rich mens chambers; to admonish them of their duties. If you enter into your Orchard, they are buse in clothing every Tree; if into the Garden, you shall finde them amongst Roses; if you travail into the field, you shall have them at their work in hedges; both at home and abroad, whithersoever you bend your course, you cannot chuse but meet with them, lest perhaps you might imagine, or else complain and finde some saults, that the Schoolmistresse and persect president of all vertue and diligence were in any place absent.

Who would not therefore be touched, yea and possessed with an extream wonder at these vertues and faculties, which we daily see and behold with our eyes. Philes hath briefly and compendiously described their nature, properties, inclinations, wit and invention in his Greek verses, which being turned into Latine, found to this effect.

Araneis natura per quam industria est, Vincus puellarum manus argutids.

Um ventris bumores supervadaneos
Etimplicantes orbium volumina,
Adversa sublegunt iis subtegunta i
Sed liciis hino densiotibus plagas
In aere appendunt, siec unde conspicor
Sejunctia cum sis omnis u medio bastis
Que suctam trabilem operis subtiam.
Es stantinum fallit ligamen luminu

Industrious nature Spiders have.
Excelling Virgins bands of skill.
Superfluous humors of bellies faves
And into webs they weave them fill,
And that without all Weavers combes.
Their folding orbes involled are;
And underneath their woofs as tombes.
Are foread the worthy work to bear,
And hang their threads in air above.
By plagues unseen to the eye of mais,
Without foundation you may provide
All their buildings sirmly stand?

Subtilitatis sub dio disormine.
Firmatur autem densitas subtégninis,
Raras in ambientis oper apris.
Muscis, culicibus, & id genus volantibus
Intensa neciens fraudulenter rélia.
Quod incidis, sejuna pastis hoc famem,
Vitamy, degit hind quietis indigim.
Suspensa centro, cassionique právidens,
Ne sila rumpus, abitinique dissua.
Ne seus rétoros standanis ets irruens.

Which may be Englished thus;

Nor yet clear light to the eyes miss bright

Can see the coupling of their thread,

The thinnesse of the woof in fight,

On pins of air are fairest spread.

On Gants and filly winged Flier,

Which gailefully in nets they take,

They feed their sill when they esp,

And yet their sile mach rest doth white.

They labour too, and do provide

Gainst windes that things that break their swalls,

That bunds from tacklings that het flide,

When greater strength dash them assay.

The History of Serpents.

And although Minerva hath nick-named the Spider, calling her malepert, shamelesse, and sawcie; Martiall, wandring, straying and gadding; Claudianie, rathe, prefumptions, and adventurous; Political Martiall, wandring, straying and gadding; Claudianie, rotten; Virgil, light; and Plantie, unprofitable and nue, hanging and thick; Juvinal, dry; Properties, rotten; Virgil, light; and Planties, unprofitable and nue, hanging and thick; Juvenus, ury, and they were made to ferve and flead us to many excellent uses: good for nothing t yet it is clear, the total this is rather an amplification, then any to that you may plainly gather and perceive, that this is rather an amplification, then any to that you may plainly gattiet and perhaps the fond Bpithets, vile badges and liveries, which these positive or measured truth, concerning the fond Bpithets, vile badges and liveries, which these politive or measured truth, concerning towed on them, as by that which followeth may plainly rehearfed Authors have unworthily behowed on them, as by that which followeth may plainly

The Spider that is called a Wolf, beto the temples, cureth the fits of a Tertian Feaver. Dioscorides. The Spider that is called a Wolf, beto the temples, cureth the fits of a Tertian Feaver. to the temples, curein the first about the neck performeth the same effect, as Pliny reporteth. The ing put into a quill, and so hanged about the neck performeth the same effect, as Pliny reporteth. The ing put into a quin, and to mange and weaveth a thin, a white, or a thick web, being inclosed in a domestical Spider, which spinneth and weaveth a thin, a white, or a thick web, being inclosed in a domeltical Spider, which infinitely and to hanged about the neck, or worn about the arm, driveth away piece of leather, or a Nut-shel, and to hanged about the neck, or worn about the arm, driveth away the fits of a Quartain Feaver, as both Disserties and Fernelss have thought. For the pain in the ears, the fits of a Quartain Feaver, as both Disserties then diffil or drop a little action. the fits of a martain reaver, as over the most of the fire, then diffil or drop a little of this Oyl into Take three live Spiders, boyl them with Oyl upon the fire, then diffil or drop a little of this Oyl into Take three live spiners, boyl them with Oyl into the pained ear, for it is very excellent, as witnesseth Marcellus Empiricus. Pliny steepeth them in Vinegar the pained ear, for it is very excellent, as witnesseth Marcellus Empiricus. the pained ear, for it is very executions, as a superher, and a little thereof to be dropped into the pained and Oyl of Rofes, and so to be stamped together, and a little thereof to be and Oyl of Roles, and to the Rampest Coubt, faith he, the pain will be mitigated, and the fame affirm. ear with a fittle Santon, and without the juyce of Spiders, mixing it with the juyce of Roses, and with eth Dioscorides. Or else strain out the juyce of Spiders, fome wooll dipped in the fame liquor, apply it to the ear.

Soraffus in his Book peri Dakeon writeth, how that the Spider which is called Cranscalaptes, being fifled or choked in Oyl, is a very present help against any posson taken inwardly into the body, as the Scholiast of Nicander reporteth. There be some that catch a Spider in the lest hand, and Beat and framp it with the Oyl of Roses, putting some of it into the ear, on the same side the tooth aketh, and as Pliny telleth us, it doth exceeding much good. Spiders applyed and laid upon their own bitings, or taken inwardly into the body, do heal and help those hurts themselves pro-

What should I talke of the white spots of the eyes, a most dangerous grief? and yet are they clean taken away with very small labour, if so be one take the legs, especially of those Spiders which are of the whitee fort, and stamping them together with Oyl, do make an Ointment for the eys. Pling. The moist juyce that is squeesed out of a house Spider, being tempered with Oyl of Roses, or one dram of Saffron, and a drop or two thereof dropped into the eyes, cureth the dropping or watering of them, by means of a rhume issuing out thereat, or else the moutture of a Spider or his wine being taken by themselves, laying a little wooll on the top of the part affected, worketh the same effect; whereby you may well understand, that there is nothing in a Spider so vile, homely, or for-

didous, that doth not fome good, and serveth to some end. Against the suffocation of the belly, Actius doth counsel to apply a Cerote to the navel made of Spiders, and faith that he hath found it to prevail much in this kinde of passion. Pliny saith, but he yeeldeth no reason for it, that Spiders help the pain and swelling of the Spleen. He writeth also further, that if a man catch a Spider, as the is gliding and descending downwards by her thread, and so being crushed in the hand, and then applyed to the navel, that the belly wil be provoked to the sool, but being taken as she is ascending, and applyed after the same former manner, that any loofenesse or flux is stayed, and restrained thereby. The same Pliny also writeth, that if a man take a Spider, and lay it upon a Fellon , (provided that the fick patient may not know fo much,) that within the space only of three days, that terrible and painful grief will be clean taken away. And besides heassimeth that if the head and feet of a Spider be cast away, and the rest of the body rubbed and bruised, that it

will throughly remedy the swelling in the fundament, proceeding of inflamation.

If any be vexed with store of Lice, and do use a suffumigation made only with Spiders, it will cause them all to fall and come away, neither will there afterwards any moe breed in that place. The fat of a Goose tempered and mixed with a Spider and Oyl of Roses together, being used as an Ointment upon the breasts, preserveth them safely, as that no milk will coagulate or curdle in them after any birth. Anonymus. Yea, that same knotty scourge of rich men, and the scorn of Physitians, I mean the Gowt, which as some learned men hold can by no means be remedied, yet seeleth mingation and diminution of pain, and curation also, only by the presence of a Spider, if it be taken alive, and her hinder-legs cut off, and afterward inclosed in a purse made of the hide of a Stag. Moreover, we fee, (which all other medicines can never do) that all they are freed for the most part, both from the Gowt in the legs and hands, where the Spiders are most found, and where they are most busie in working, and framing their ingenious devised webs. Doubtlesse, this is a rare miracle of nature, and a wonderful vertue, that is in this contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature, or rather esteemed to be so vile, about the contemptible little creature. jech, and of no estimation. Rich men were happy indeed, if they knew how to make use of their

Antonius Pius was wont to fay, that the sharp words, witty fayings, quirks and subtilties of Sophifters, were like unto Spiders webs, that contain in them much cunning Art, and artificial conceit, Of the Spider.

but had little other good besides. If any one be newly and dangerously wounded, and that the miseput usuality feareth a bleeding to death, what is a more noble medicine, or more ready at hand, then table party feareth a bleeding to death, what is a more noble medicine, or more ready at hand, then a thick Spiders web, to binde hard upon the wound, to flay the inordinate effusion of bloud? Que-Athick spiners we were as diligent and greedy to fearch out the true properties and vertues of our dionleffe, if we were as diligent and greedy to fearch out the true properties and vertues of our Monicue, it we would not enforce our felves of our own domestical remedies, which we would buy of others fo dearly, we would not enforce our felves own unmertain after those of forain Countries, as though things fetcht far off, were better with nucle cage, part hand; or as though nothing were good and wholesome, unlesse it came from then our own net take. Surely, unlesse there were some wilde worm in our brains, or that we were bewitched and possessed with some fury, we would not so far be in love with forein wares, or be so bewittened and political water, or belo much befotted, as to feek for greedy new physick and Physical means, confidering that one poor Spiders web will do more good, for the franching of bloud, the curation of ulcers, the hindering of fanies, slime, or slough to grow in any fore, to abate and quench any inflamations, to conglutinate and consolidate wounds, more then a Cart-load of Bole fetcht out of Armenia, Sarcocolla, Sandaratha or that earth which is fo much nobilitated by the impresse of a seal, and therefore called Torra Sigillad, the clay of Sumos, the dirt of Germany, or the loam of Lemnos. For a cobweb adfringeth, refrigerateth, foldereth, joyneth, and closeth up wounds, not suffering any rotten or filthy matter to remain long in them.

And in regard of these excellent vertues and qualities, it quickly cureth bleeding at the nose, the Hamorrhoids, and other Bloudy-fluxes, whether of the opening of the mouths of the veins, their opertions, breakings, or any other bloudy evacuation that too much aboundeth, being either given by it felf alone in some Wine, either inwardly or outwardly, or commixed with the Bloud-stone, Grocus

Martin, and other the like remedies fit for the fame intentions.

The cobweb is also an ingredient into an unguent which is made by Physitians, against the disease called Serpeço, and being bound to the swellings of the fundament, if there be inflamation joyned withall, it consumeth them without any pain, as Marcellus Empiricus testifieth. It likewise cureth the watering or dropping of the eyes, as Pliny reporteth, and being applyed with Oyl, it confolidateth the wounds of the joints : and some for the same intent, use the ashes of cobwebs, with fine meal

and white Wine mixed together.

Some Chirurgeons there be that cure Warts in this manner; They take a Spiders web, rolling the same up on a round heap like a ball, and laying it upon the Wart they then set fire on it, and so burn it to ashes, and by this way and order the Warts are eradicated, that they never after grow again. Mucellus Empiricus taketh Spiders webs that are found in the Cypresse tree, mixing them with other convenient remedies, fo giving them to a podagrical person for the asswaging of his pain. Against the pain of a hollow tooth, Galen in his first Book De Compos: medicam. secundum loca, much commendeth, (by testimony of Archigenes) the Egges of Spiders, being tempered and mixed with Oleum Nardinum, and so a little of it being put into the tooth. In like fort Kiramides giveth Spiders egges for the curation of a Tertian Ague. Whereupon we conclude with Galen, in his Book to Pifo, that Nature as yet never brought forth any thing so vile, mean, and contemptible in outward shew, but that it hath manifold and most excellent and necessary uses, if we would shew a greater diligence, and not be so squeamish as to refuse those wholesome medicines which are easie to be had, and without great charges and travail acquired.

I will add therefore this one note before I end this discourse, that Apes, Marmolets or Monkles, the Serpents called Lizards, the Stellion, which is likewife a venomous Beaft like unto a Lizard, having spots in his neck like unto stars. Wasps, and the little beaft called Ichneumon, Swallows, Sparrows, thelittle Titmouse, and Hedge-sparrows, do often feed full savourly upon Spiders. Besides, if the Nightingale, (the Prince of all finging Birds) do eat any Spiders, the is clean freed and healed of all

In the days of Alexander the Great, there dwelled in the City of Alexandria a certain young maid, which from her youth up, was fed and nourished only with eating of Spiders, and for the same cause the King was premonished not to come neer her, lest peradventure he might be infected by her poyfonous breath, or by the venom evaporated by her sweating. Attertue likewise hath recorded in his writings, that there was a certain noble young Virgin dwelling at Colen in Germany, who from her tender years was fed only with Spiders. And thus much we English men have known, that there was one Henry Lilgrave, living not many years fince, being Clerk of the Kitchen to the right Noble Ambrofe Dudley Earl of Warwick, who would fearch every corner for Spiders, and if a man had brought him thirty or forty at one time, he would have eaten them all up very greedily, such was his delirous longing after them.

of the STELLION.

They are much deceived they confound the green Lizard, or any other vulgar Lizard, for because the Stellion hath a rule e colour: and yet (as Manhiolus writeth) seeing Arifolle hath left recorded, that there are venomous Stellions in Italy, he thinketh that the little white Beast with stars on the back, sound about the City of Italy, he walls and ruines of old houses, and is there called Taraniula, is the Stellion of which he specified the heat there it liveth upon Spiders. Yet that there is another and more noble kinde of Stellion inciently so called of the searned, shall afterward appear in the searned. ciently to called of the learned, fhall afterward appear in ther and more noble kinde of Stellion, the fucceeding discourse.

This Beaft or Serpent is called by the Grecians, Colottes, Afcalobtes, and Galeotes, and fuch a one was This Bean or serpent is caned by the of the house eased her belly into the mouth of Socreter as that which Aristophanes faigneth from the fide of a house eased her belly into the mouth of Socreter as that which Aripophanes largheth from the observed the course of the stars, and motion of the Moon, he gaped, when in a Moon-shine night he observed the course of the stars, and motion of the Moon. he gaped, when in a moon-time ingut he down the Moon. The reason of this Greek name Ascalabotes, is taken from Asoalos, a circle, because it appeareth on the The reason of this Green name estimatories, it because the Howbeit, that seemeth to be a faigned Etymoback full of such circles like stars, as written Perettus. Howbeit, that seemeth to be a faigned Etymoback full of such circles like stars, as written and the burn of t back full of fucil circles like hats, as whether take it, that Alcola fignifieth impurity, and that by reason of the unlogie, and therefore I rather take it, that Alcola fignifieth impurity, and that by reason of the unlogie, and therefore I rather take it, that Alcola fignifieth impurity, and that by reason of the unlogic, and therefore I rather take it, that Alcola fignifieth impurity, and that by reason of the unlogic, and therefore I rather take it, that Alcola fignifieth impurity, and that by reason of the unlogic, and therefore I rather take it, that Alcola fignifieth impurity, and that by reason of the unlogic, and the second of the unlogic in the unl logie, and theretore I rather take it, that Ajouis inguine in the uncleannesse of this beast, it was called Afcalabates, or as Suidas deriveth it, of Colebates, because by the cleannence of this bean, it was cannot represent the walls even as Rats and Mice; or as Kiramider will help and dexterity of the fingers, it climbeth up the walls even as Rats and Mice; or as Kiramider will help and dexterity or the inigers, it commerces are the wall climbeth upon wood and trees. And for the have it, from Calor, fignifying a piece of wood, because it climbeth upon wood and trees. And for the have it, from Calos, lignifying a piece of woodsbecause it elimbeth, but at this day it is vulgarly called fame reason it is called Galeotes, because it climbeth like a Weafil, but at this day it is vulgarly called name reason it is called Galeries, because the state of opinion, that it is also known among them among the Greelans, Lidkoni; although some are also of opinion, that it is also known among them by the words Thamiamithos, and Pfammamythe.

Among the vulgar Hebrews, it is sometimes called Letaab, and sometimes Semmamit, as Munster writeth. The Arabians call it Sarnabraus, and Senabras, a Stellion of the Gardens. And peradventure Guarill, Guasemabras, Alurel, and Gnases. And Sylvatious also useth Epithets for a Stellion. And the general Arabian word for such creeping biting things, is Vasga, which is also rendered a Dragon of the house. In stead of Colotes, Alberius hath Arcolus. The Germans, English, and French, have no words for this Serpent, except the Latine word, and therefore I was justly constrained to call it a Stellion, inimitation of the Latine word.

As I have shewed some difference about the name , so it now ensueth that I should do the like about the nature and place of their abode. First of all therefore I must put a difference betwirt the Italian Stellion or Tarentula, and the Thracian or Grecian, for the stellion of the Ancients is proper to Greela. For they fay this Stellion is full of Lentile spots, or speckles, making a sharp or shrill shricking noise, and is good to be eaten, but the other in Italy are not so. Also they say in Stella, that their Stellions inflict a deadly biting, but those in Italy cause no great harm by their teeth. They are covered with a skin like a shell or thick bark, and about their backs there are many little shining spots like eyes, (from whence they have their names) streaming like stars, or drops of bright and clear water, according to this verse of Ovid;

> - Aptumque colori Nomen habet varis Stellatus corpora guttis. Which may be Englished thus; And like bis spotted biew, fo is his name, The body starred over like drops of rain.

It moveth but flowly, the back and tail being much broader then is the back and tail of a Lizard, but the Italian Tarentulaes are white, and in quantity like the smallest Lizards : and the other Grein Lizards, (called at this day among them Hacont) is of bright filver colour, and are very harmful and angry, whereas the other are not fo, but so meek and gentle, as a man may put his fingers into the mouth of it without danger. One reason of their white bright shining colour, is because they want bloud, and therefore it was an error in Sylvaticus to say that they had bloud.

The teeth of this Serpent are very small and crooked, and whensoever they bite, they flick fast in the wound, and are not pulled forth again except with violence. The tail is not very long, and yet when by any chance it is broken, bitten, or cut off, then it groweth again. They live in houses, and neer unto the dores and windows thereof make their lodgings, and fometims in dead-mens graves and Sepulchres, but most commonly they climbe and creep aloft, fo as they fall down again; Sometimes into the meat as it is in dreffing; and sometimes into other things, (as we have already faid) into Socrates mouth, and when they descend of their own accord, they creep side-long, They eat Honey, and for that cause creep into the Hives of Bees, except they be very carefully stopped, as Virgil writeth;

Nam sape favos, ignotus adedit Stellio.

Many times the Stellion at unawares meeteth with the Honey-combs. They also of haly many times eat Spiders. They all lie hid four months of the year, in which time they eat nothing and twice in the year, that is to fay, both in the Spring time and Autumn, they cast their skin, which they greedily ear to foon as they have stripped it off. Which Theophress and other Authors write, is an envious part in this Serpent or ergeping creature, because they understand that it is a noble remedy against the Falling-ficknesse: wherefore to keep men from the benefit and good which might come thereby, they speedily devouris.

And from this envious and fubtile part of the Stellion, cometh the crime in Wianus called Crimen Stellionatus, that is, when one man fraudulently preventeth another of his money, or wares, or hargain, even as the Stellion doth man kinde of the remedy which cometh unto them by and from

The crime is also called Extortion, and among the Romans, when the Tribunes did withdraw from the Souldiers their provision of victual and corn, it is faid. Tribunes qui per Stelluturas Militibus aliquid abfluiffent, capitali pana afficit. And therefore Rudem relateth a Hiltory of two Tribunes, who for this stellature were worthily stoned to death by the commandment of the Emperor. And all frauds whatfoever, are likewife taxed by this name, which were not punishable but by the doom of the Supream or highest Judge, and thereupon Alciane made this Emblem following.

Stellio, qui latebras & cava bufta, colit, Invidia pravique doli fert [ymbola, picius: Heu nimum nuribus cognita Zelotypis.

... Sit quibus immerfus Stellie, vina bibat. Hino vindicia frequens, degepte pellice vino, Quam forme amillo flore relinquit amans,

Which may be Englished thus; The little Lizard, on Stollion starred in body grain In Secret holes, and groves of dead which doth remain, When painted you it fee, of drawn before the eye, A symbole then you view of deep deceit and our fed enoy : Alas, this is a thing to jealous wives known too well, For wholeever of that Wine, doth drink his fill Wherein a Stellion bath been drencht to death, His face with filthy Lyntile foots all ugly it appeareth, Herewith a Lover oft requites the fraud of concubine, Depriving her of beauties biew by draught of this fame Wine.

The Poet Oxid hath a pretty fiction of the Original of this curfed envy in Stellions, for he writeth of one Abor the fon of Morantira, that received Geres kindely into her house, and gave her hospitality, whereat the faid Abas being displeased, derided the facrifice which his mother made to Ceres : the Goddeffe feeing the wretched nature of the young man, and his extream impiety against the facrifice of his Mother, took the Wine left in the goblet after the facrifice, and poured the fame upon his head, whereupon he was immediately turned into a Stellion, as it is thus related by Ovil.

> Combibit es maculas, & que mode brachia gessit Crura gerit, cauda est mutatis addita membris : Inque brevem formam, ne sit vis magna nocendi, Contrabitur, parvaque minor mensura lacerta est. In English thue: His moush sucks in those spots : and now where arms did stand. His legs appear, and to his changed parts was put a tail, And left it should have power to harm, finall was the bodies band, And of the Lizards poyfonous, this leaft in fhare did vail.

Their bodies are very brittle, fo as if at any time they chance to fall, they break their tails. They lay very small egges, out of which they are generated: and Pliny writeth, that the juyce or liquor of these egges laid upon a mans body, causeth the hair to fall off, and also never more permitteth it to grow agein. But whereas we have faid, it devoureth the skin, to the damage and hurt of men. you must remember, that in ancient time the people did not want their policies and devises to take away this skin from them before they could eat it. And therefore in the Summer time they watched the lodging place and hole of the Lizard, and then in the end of the Winter toward the Spring, they took Reeds and did cleave them in funder, thefe they composed into little Cabinets, and fee them upon the hole of the Serpent; Now when it awaked and would come forth, it being grieved with the thicknesse and fraightnesse of his skin, present out of his hole through those Reeds or , Cabinet, and finding the same somewhat fraight, is the more glad to take it for a remedy; so by little and little it flideth through, and being through, it leaveth the skin behinde in the Cabinet, into the which it cannot re-enter to devout it. Thus is this wily Serpent by the policy of man juftly beguiled, losing that which it fo greatly defireth to possesse, and changing nature, to line his gue with his coat, is prevented from that gluttony, it being sufficient to have had it for a cover

Actius.

Crescen.

Pliny.

Of the Tortoise.

in the Winter, and therefore unsufferable that it should make food thereof, and ear the same in the

Summer,

These Stellions (like as other Serpents) have also their enemies in nature, as first of all they are hated by the Asses, for they love to be about the Mangers and racks on which the Asses feedeth, and hated by the Asses, for they love to be about the Mangers and racks on which the Asses feedeth, and from thence many times they creep into the Asses open Nostrils, and by that means hinder his eating But above all other, there is greatest antipathy in nature betwixt this Serpent and the Scorpion, for it a Scorpion do but see one of these, it falleth into a deep sear, and a cold sweat, out of which it is delivered again very speedily: and for this cause a Stellion putrified in Oyl, is a notable remedy against the biting of a Scorpion; and the like war and differentian, is affirmed to be betwixt the Stellion and the Spider.

We have shewed already, the difference of Stellions of Italy from them of Greece, how these are of a deadly poylonous nature, and the other innocent and harmlesse, and therefore now it is also convenient, that we should show the nature and cure of this poylon, which is in this manner;

Whenfoever any man is bitten by a Stellion, he hath ach and pain thereof continually, and the Whenfoever any man is bitten by a Stellion, he hath ach and pain thereof continually, and the wound received looketh very pale in colour, the cure whereof, according to the faying of Aetiu, is to make a plaitler of Garlick and Leeks mixed together, or elfe to eat the faid Garlick and Leeks, to make a plaitler of Garlick and Leeks mixed together, or elfe to eat the faid Garlick and Leeks, to make a plaitler of Garlick and Leeks mixed together, or elfe apply Nigella Rodrinking after them a good draught of sweet Wine, unmixed and very pure, or elfe apply Nigella Rodrinking after them a good draught of sweet Wine, unmixed and to the wound. But sometimes it of a Faulcon, or a Scorpion to be bruised all to pieces, and laid to the wound. But sometimes it happeneth, that a mans meat or drink is corrupted with Stellions that fall into the same from some happeneth, that a mans meat or drink is corrupted with Stellions that fall into the same from some happeneth, that a mans meat or drink is course the dump and pain in the stomach. Then must the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passege, that the cure be made also by vomits to avoid the poyson, and the cure of the cure be made also by vomits to avoid the poyson and the cure by the cure of the cure by the cure of the cure by the cure of t

The remedies which are observed out of this Serpent are these: Being eaten by Hawks, they make them quickly to cast their old coats or feathers. Others give it in meat after it is bowelled, not them that have the Falling-sicknesse. Also when the head, feet, and bowels are taken away, it is to them that have the Falling-sicknesse. Also when the head, feet, and bowels are taken away, it is profitable for those persons which cannot hold in their urine; and being sodden, is given against the Bloudy-slux. Also sod in Wine with black Poppy-seed, cureth the pain of the loins, if the Wine be

drunk up by the fick patient.

The Oyl of Stellions being anointed upon the arm-holes or pits of children, or young persons, it restraines hall hair for ever growing in those places. Also the Oyl of Stellions, which are sold in Oylolive with Lizards, do cure all boils and wens, consuming them without lancing or breaking. And the assess of the Stellion are most principally commended against the Falling-sicknesse, like as also is the skin or trunck, as we have said before. The head burned and dryed, and afterward mixed with Honey-attick, is very good against the continual dropping or running of the eyes; and in the days of Pliny, he written that they mixed Stibium herewithal. The heart is of so great force, that it being eaten, bringeth a most deep and dangerous sleep, as may appear by these verses:

Mande cor, & tantus profternet corpora fomnus,
Ut foindt possible that absque dolore manus.
Which may be Englished thus;
Eat you the heart, and then such sleep the body will possess,
That hands may from the same be cut away painlesse.

To conclude, the Physicians have carefully observed fundry medicines out of the egges, gall, and dung of Stellions, but because I write for the benefit of the English Reader, I will spare their relation, seeing we shall not need to fear the bitings of Stellions in England, or expect any drugs among our Apothecaries out of them, and therefore I will here end the History of the Stellion.

of the TYRE.

Actorius.

Calius Rho.

Calles Itio

Amatu.

There be some which have consounded this Serpent with the Viper, and taken them both to be but one kinde, or at least the Tyre to be a kinde of Viper, because the Arabians call a Viper Thiron, of the Greek word Therion, which signifieth a wilde beast, and whatsoever the Greekans write of their Echidna, that is their Viper, the same things the Arabians write of the Tyre, and Lonion on compiled a whole Book in the defence of that matter: and from hence cometh that noble name or composition antidotary, called Theriaca, that is, Triacle. But Avicen in the mention of the Triacle of Andromachus, distinguisheth the Triacle of the Viper, from that of the Tyre, and calleth one of them Trobisco Tyri, and the other Trobiscos Vipera. So Gentilis and Florentinus do likewise put a mains of the difference betwixt the Tyre and the Viper, although in many they are alike, and agree to gether.

gether.
This Tyre is called in Latine Tyrus and Tyria, and also among the Arabians, as Sylvaticus writeth,
Eosmari, and Alpsahen. Rabbi Moses in his Aphorisms writeth, that when the Hunters go to seek

these Serpents, they carry with them bread, which they cast unto them, and while the Tyre doth eat it, he closeth his mouth so fast, that his teeth cannot suddenly open again to do his hunting adversary any harm, and this thing (as he writeth) is very admirable at the first, to them that are ignorant of the secret in nature. Galen also writeth so much to Piso of Vipers, and he saith that the Circulators, Juglers or Quacksalvers, did cast certain mazes or small cakes to them, which when they had rasted, they had no power to harm any body.

taited, they take it said to be a Serpent about the coafts of Jeriebo in the Wildernesse, where it hunteth Birds, and liveth by devouring of them and their egs. And a consection of the slesh of this
serpent, with the admixture of some sew other things, taketh away all intoxicate poyson, which
consection is called Triacle. It is also reported, that whereas the Dragons have no poyson of themselves, they take it away from this Serpent, and so poyson with a borrowed venom. For this poyson is very deadly: and there is a tale (which I will not tell for truth) that before the coming and
death of our Saviour Jesus Christ, the same was unremediable, and they dyed thereof, whosever
they were that had been poysoned by a Tyre; but on the day of Christ his passion, one of them
was found by chance in Jesusalem, which was taken asive, and brought to the side of our Saviour
hanging up on the Crosse, where it also sastened the teeth, and from that time ever since, all the kinde
have received a qualistic and remediable poyson, and also their slesh made apt to cure it self, or
other venous.

It is reported that when the Tyrus is old, he casteth, or rather wresteth off his coat in this manner following; First it getteth off the skin which groweth betwixt the eyes, by which it looketh as if it were blinde; and if it be strange to a man, (I mean the first time that ever he saw it) he will verily take it to be blinde: asterward, it also sleyeth off the skin from the head, and so at last by little and little, the whole body, at which sight it appeareth as though it were an Embryon, or skinlesse Scrpent. They keep their egs in their belly, and in them breed their young ones, as the Vipers do, for before they come out of the dams belly, they are in all parts (according to their kinde) perfect creatures, and so every one generateth his like, as do four-sooted Beasts.

I take it by the relation of Gesner, that the Dipsas in Italy is called Tyrm. Also Cardan writeth, that there is a supposed and salle conceit, that with the slesh of this Tyre, mixed with Hellebore and water, is made a confection to restore youth: but the truth is, it rather weakeneth and destroyeth bodies, then helpeth them, and maketh a counterseit or varnished salle youth, but no true youth at all. Thus sar Gardan, and thus much of this Serpent, the other things written of it, are the same that are written of the Viper.

Of the TORTOISE.

The last four-footed Egge-breeding Beast, cometh now to be handled in due order and place; namely, the Tortoise, which I have thought good to infert also in this place, although I cannot finde by reading or experience, that it is venomous, yet seeing other before me have ranged the same in the number and catalogue of these Serpents and creeping creatures, I will also follow them; and therefore I will first expresse that of the Tortoise, which is general and common to both kindes, and then that which is special, and proper to the Land and Sea Tortoises.

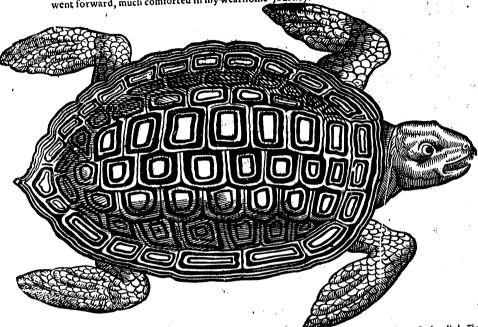

The name of this Beaft is not certain, among the Hebrews some call it Schabhul, some Kipod, and some Homes, whereas every one of these do also signific another thing, as Schabhul, a Snail; Kipod, a Hedge-hog; and Homes, a Lizard. The Chaldeans call this Beaft Thiblela; the Arabians term it Sisewas, also Kausen salabasse, and Halachalie; the Italians call this Testuma, sestion, we tessue; the Inhabitants of Taurinum, tupparia; the Portugals, Gagado; the Spaniards, Galapago, and Tartuga; the French, Tortue, and Tartue; and in Savoy, Boug coupe; the Germans, Schillegot, and Tartue; the Inhabitants of Taurinum, which answereth our English word Shell-crab; the Grecians call it Chelone; and the Latines, Tessue, which words in their several languages, have other significations, as are to be sound in every vocabular Dictionary, and thefore I omit them, as not pertinent to this businesse or History.

There be of Tortoises three kindes, one that liveth on the land, the second in the sweet waters, and the third in the Sea, or salt waters. There are found great store of these in India, especially of the Water-tortoises, and therefore the people of that part of the Countrey are called Chelonophagi; that is, Eaters of Tortoises, for they live upon them: and these people are said to be in the East-part of India. And in Carmania the people are likewise so called. And they do not only eat the slesh of them, but also cover their houses with their shells, and of their abundance, do make them all manner of vessels. Pling and Solinus write, that the Sea-tortoises of India are so big, that with one of them they cover a dwelling Cottage. And Strabo saith, they also row in them on the waters, as in a Boat.

The Island of Serapis in the Red-sea, and the farthest Ocean Islands, toward, the East of the Red-sea, hath also very great Tortoises in it: and every where in the Red-sea they so abound, that the people there do take them and carry them to their greatest Marts and Fairs to sell them, as to kaphiis, to Ptolemais, and the Island of Dioscorides, whereof some have white and small shells. In Lybia also they are found, and in the night time they come out of their lodgings to feed, but very softly, so as one can scarcely perceive their motion.

The History of Serpents.

And of one of these Scaliger telleth this story. One night (faith he) as I was travelling, being overtaken with darknesse and want of light, I cast about mine eyes to seek some place for my lodging, safe and secure from wilde Beasts; and as I looked about, I saw (as I thought) a little hill or heap of earth, but in truth it was a Tortoise, covered all over with mosse: upon that I ascended and sate down to rest, whereupon after a little watching I fell asleep, and so ended that nights rest upon the back of the Tortoise. In the morning, when light approached, I perceived that I was removed far from the place, whereon I sirst chose to lodge all night sland therefore rising up, I beheld with great admiration the face and countenance of this Beast, in the knowledge whereof, (as in a new nature) I went forward, much comforted in my wearisome journey.

The description of the Tortoise and several parts thereof now solloweth to be handled. Those creatures (saith Pliny) which bring forth or lay egs, either have seathers as Fowls, or have scales as Serpents, or thick hides as the Scorpion, or else a shell like the Tortoise. It is not without great caute that this shell is called Scutum, and the Beast Scutellaria, for there is no buckler and shield so hard and strong as this is. And Palladiu was not deceived when he wrote thereof, that upon the same night safely passe over a Cart-wheel, the Cart being loaded. And therefore in this the Tortoise's more happy then the Crocodile, or any other such Beast.

Albert's writeth that it hath two shels, one upon the back, the other on the belly, which are conjoyned together in four places, and by reason of this so firm a cover and shell, the sless that the strength of the strength

Beside, the common nature of other thick-hided creatures. It hath also reins, except that kinde of Tortoise called Lutaria, for that wanteth both reins and bladder; for by reason of the softnesse of the cover thereof the humor is over-fluent; but the Tortoise that bringeth forth egs hath of the cover thereof the humor is over-fluent; but the Tortoise that bringeth forth egs hath inward parts like a perfect creature: and the semales have a singular passage for their excreasing which is not in the males. The egs are in the body of the belly, which are of a party-colour like the egs of Sinds.

Their stones cleave to their loins, and the tail is short, but like the tail of a Serpent.

They have four legs, in proportion like the legs of Lizards, every foot having five fingers or divisions upon them, with nails upon every one. And thus much for the several parts.

They

They are not unjustly called Amphibia, because they live both in the water and on the land, and in this thing they are by Pliny resembled to Beavers: but this must be understood of the general, otherwise the Tortoises of the land do never dare come into the water: and those of the water can breath in the water, but want respiration, and likewise they lay their Egges and sleep upon the day land. They have a very slow and easie pace; and thereupon Pauvius calleth it Tardigrada, and also there is a Proverb, Testudinus incessus for a flow and soft pace, when such a mograda, and also there is a Proverb, Testudinus incessus for a flow and soft pace, when such a mograda, and also there is a Proverb, Testudinus incessus for a flow and soft pace, when such a mograda, and also there is a Proverb, Testudinus incessus for a flow and soft pace, when such a mogradus so the expression is to be expressed. The Tortoise never casteth his coat, no not in his old age. The voyce is an abrupt and broken hissing, not like to the Serpents, but much more loud and diffused. The male is very salacious and given to carnal copulation, but the semale is not so, for when she is attempted by the male, they sight it out by the teeth, and at last the male overcometh, whereat he rejoyceth as much as one that in a hard consist, fight, or battail, hath won a fair Woman; the reason of this unwillingnesses is, because it is exceeding painful to the semale. They engender by riding or covering one another. When they have laid their Egges, they do not fit upon them to hatch them, but lay them in the Earth, covered, and there by the heat of the Sun is the young one formed, and cometh forth at due time without any surther help from his Parents.

They are accounted crafty and subtle in their kinde, for subtlenesse is not only ascribed to things that have a thin bloud, but also to those that have thick skins, hides, and covers, such as the Tortoise and Crocodile have. The Tortoise is an enemy to the Partridge, as Philes and Ellanus write: Also the Ape is as fraid thereof, as it is of the Snail: and to conclude, what soever enemy it hath, it is safe enough as long as it is covered with his shell, and clingeth saft to the earth beneath; and therefore came the proverb, Oikes philos, oikes aristos. That house which is ones friend, is the best bones.

The Poets give a fabulous reason, why the Tortoise doth ever carry his house upon his back, which is this: They say, that on a time Jupiter bad all living creatures to a banquet or Marriage seast, and thicher they all came at the time appointed, except the Tortoise: and she at last also appeared at the end of the season the meat was all spent: whereat Jupiter wondered, and asked her why she came no soone? Then it answered him, Oikos philos, eikos aristos; at which answer Jupiter being angry, adjudged her perpetually to carry her house on her back, and for this cause they fable, that the Tortoise is never separated from her house.

Flaminim the Roman dissivating the Acheans from attempting the Island of Zacynthm, used this argument; and so afterward T. Livims. Caterum sicut Tessudinem, ubi collecta in sum tegumen est, tutam ad omnes islim vidi esse: whi exerit partes aliquises, quadeunque nudavit, obnoxium atque instrument babere: Haud dissimilier volu Achei, clausis undique maris, quod intra Peloponnesum est, termino, ea & jungere volu; & multiputation deste est si semel aviditate plura amplectendi binc excedatis, nuda volu omnia qua extra sint & exposita ad unues islus esse. Thus sar Pluy. That is to say, Even as when the Tortoise is gathered within the compasse of her shell, then is it safe and free from all stroaks, and seeleth no violence, but when so ever she putteth sorth a limb or part, then is it naked, instrm, and easie to be harmed: so is it with you Acheans, for by reason of the inclosed seat of Peloponnesum within the Straights of the Sea, you may well winde all that together, and being conjoyned, as well desend it: But if once your avidous and covetous mindes to get more, appear and stretch it self beyond those limits, you shall lay open your naked infirmity and weaknesse, to all force, blows, and violence what soever. Wherefore the Tortoise careth not for slies, and men with good armour care not much for light and easie adversaries.

Alcinium hath a witty Emblem of a Tortoife to expresse a good huswife, and that the same of her vertues, spreadeth much further then either beauty or riches.

Ama Venus, quenam heo facies ? quid denotat illa Testudo, molli quam pede diva premis ? Me sicessinxit Phidias, sexumque reserri

Loves holy God, what means that ugly face?
What doth that Tortoile fignifie indeed,
Which thou & God Idesse under soft foot dost pace?
Declare what means the sam: to me with speed:

quid denotat illa Fæmineum nostra justit ab estigie, quedq; manere domi,& tacitas debet esse puellas, referri Supposuit pedibus talta signa meis.
Which may be Englished thus;

Such is the shape that Phidias did me frame, And hade mego resemble Womankinde, Te teach them silence, and in house remain, Such pictures underneath my seet you sinde.

There is a manifold use of Tortoises, especially of their cover or shell, and likewise of their slesh, which cometh now to be handled. And first of all, the ancient ornaments of Beds, Chambers, Tables, and Banquetting houses, was a kinde of artificial work, called Carvillus, and this was framed in gold and silver, brasse and wood, Ivory and Tortoise-shels; but, Mode luxuria non fuerit contents a lignory emit estudinem facit: That is to say, Ryot not contented, sought precious frames of wood, and again, the use of wood caused Tortoise-shells to be deerly bought, and thereof also complained the Poet Juvenal, where he saith;

Nemo curabat Rivalis in Oceani fluëu tefindo nataret Clarum Trojugenio fatiura & nobile fulcrum. Yyy2 In English thus: Then none did care for Torsoile in the Ocean flood, To make the noble beds for Trojans blond.

We have shewed already that there are certain people of the East called Chelophage, which live bu eating of Tortoiles, and with their shells they cover their houses, make all their vessels, row in eating of lortones, and with their mens they and make them likewife ferve for many other them upon the water, as men use to row in boats, and make them likewife ferve for many other

But as concerning the eating of the flesh of Tortoises, the first that ever we read that used this But as concerning according as Caliw Bhod: and other Authors writeth. Besides, Aloysus ill diet, were the Amazons, according as Caliw Bhod: and other Authors writeth. Besides, Aloysus Cadamuftus affirmeth, that he himfelf did taft of the flesh of a Tortoile, and that it was white in colour. much like unto Veal, and not unpleasant. But Rassis of a clean contrary opinion, condemning it for very unfavory, and unwholefome, because the taste and temperament thereof is betwirt the Land and the Water, it being a Beast that liveth in both Elements. And in eating hereof the Greeans have a proverb, Chelones kreas he phagein, he me phagein: That is, either eat Tortoile flesh, or eat it not. Meaning that when we eat it, we must eat nothing else, and therefore must be filled suffici. ently only with that kinde of meat; For to eat little, breedeth fretting in the belly, and to eat much entry only with the first according to the observation of many actions, which being done frigit o ignaviter, Chatis, coldly and flothfully to halfs, do no good, but being done acriter & explicate, earnestly and throughly bring much content and happinesse.

But I marvail why they are used in this age, or defired by Meat-mongers, seeing Apiciu in all his Book of Variety of Meats, doth not mention them, and I therefore will conclude the eating of Tortoises to be dangerous, and hateful to Nature it self, for unlesse it be taken like a Medicine, it doth little good, and then also the Sawces and decoctions or compositions that are confected with it, are fuch as do not only qualific, but utterly alter all the nature of them, (as Stephanus Aquam hath well declared in his French discourse of Frogs and Tortoises.) And therefore to conclude this History of the Tortoile, I will but recite one riddle of the strangenesse of this Beast which Tertullian out of Pacuvius maketh mention of, and also in Greek by Mascopulus, which is thus translated.

Animal peregrina natura, fine fpiritu spiro, geminis oculis retro juxta cerebrum, quibus ducibus amressum progredior. Super ventre caruleo pergo, sub quo venter latet albus, apertus & clausus. Oculi non aperinatur, neq; progredior, donec venter intus albus vacuus est. Hoc faturato, oculi apparent insignes, & pergo aditer : Et quanquam mutum varias edo voces : That is to fay, I am a living oreature, of a strange nature, I breath without breath, with two eye behinde, neer my brains do I go forward, I go upon a blew belly, under which it also another white, open and shut, my eyes never open, I go forward until my belly be empty, when it is full, then they appear plain and I go on my journey, and although I ammute or dumb, yet do I make many voyces. The explication of this riddle, will thew the whole nature of the Beaft, and of the Harp called Chelys, For lome things are related herein of the living creature, and some things again of an Instrument of Musick made upon his shell and cover. And thus much for the Tortoise in general, the Medicines I will referve unto the end of this History.

of the TORTOISE of the Earth, whose shell is only figured.

Hese Tortoises which never 1 come in water, either sweet or Salt, clear or muddy, are called by Grecians, Chelone Cherfaie; by the Latines, Cherfina, and Testudines, Terre-Ares, Sylvefires, and Montane; and by Nicander, Orine ; and the French peculiarly Tortue des Boys, a Tortoise of the wood.

These are found in the Desarts of Africa, as in Lybia and Mauritania, in the open fields, and likewise in Lydia in the Corn-fields, for when the

land, their shares turn them out of the earth upon the surrows as big as great Glebes of land, And the Plough-men come to plough their thels of thefe the Husbandmen burn on the land, and dig them out with Spades and Mattocks, even

as they do Worms among places full of fuch vermine. The Hill Parthenius, and Soron in Arcadia, do yeeld many of thefe land Tortoifes. The fhell of this living Creature is very pleasantly distinguished with divers colours, as earthy, black, blewish, and almost like a Salamanders. The liver of it is small, yet apt to be blown or swell with winde, and in all other parts they differ not from the common and vulgar general prefixed description

These live in Corn-fields, upon such fruits as they can finde; and therefore also they may be kept in Chefts or Gardens, and fed with Apples, Meal, or Bread without Leaven. They eat all Cockles, and Worms of the earth, and Three-leaved-grasse. They will also eat Vipers, but presently

Strabo.

after they eat Origan, for that herb is an antidote against Viperine poylon for them, and unlesse they can instantly finde it, they die of the poyson. The like use it is said to have of Rue, but the Tortoiles of the fandy Sea in Africk live upon the fat, dew, and moiltnesse of those Sands. They are ingendered like other of their kinde, and the males are more venereous then the females because the female must needs be turned upon her back, and she cannot rise again without help: wherefore many times the male after his lust is satisfied, goeth away, and leaveth the poor female to be destroyed of Kites, or other adversaries: their natural wildom therefore hath taught them to prefer life and fafety before lust and pleasure. Yet Theorits writeth of a certain herb, that the male Tortoise cetteth into his mouth, and at the time of luft turneth the same to his semale, who presently upon the smell thereof, is more enraged for copulation then is the male, and so giveth up her self to his pleasure without all fear of evil, or providence against future danger: but this herb neither he nor any other can name. They lay Egges in the earth, and do not hatch them, except they breath on them with their mouth, out of which at due time come their young ones. All the Winter time they die themselves into the earth, and there live without eating any thing, insomuch as a man would think they could never live again, but in the Summer and warm weather they dig themselves out again without danger. The Tortoifes of India in their old and full age change their shells and covers, but all other in

the World never change or cast them. This Tortoise of the earth is an enemy to Vipers, and other Sernents, and the Eagles again are enemies to this, not so much for hatred as desirous thereof for Phylick, against their ficknesses and diseases of nature; and therefore they are called in Greek Chelough baget detoi, Tortoife-eating Eagles: for although they cannot come by them out of their deep and hard shells, yet they take them up into the air, and so let them fall down upon some hard stone or Rock, and thereupon it is broken all to peeces, and by this means dyed the famous Poet E/cbplu, which kinde of fate was foretold him, that fuch a day he should die: wherefore to avoid his end, in a fair Sun-shine clear day he fate in the fields, and suddenly an Eagle let a Tortoise fall down upon his head which brake his skull, and crushed out his brains, whereupon the Grecians

wrote:

Aeschulo graphonti, epipeptoke Chelone. Which may be Englished thus; Eschylus writing upon a rock, A Tortoile falling , bis brains out knock.

The use of this land Tortoise, are first for Gardens, because they clear the Gardens from Snails and Worms: out of the Arcadian Tortoiles they make Harps, for their shells are very great, and this kinde of Harp is called in Latine Teffudo, the inventer whereof is faid to be Mercury, for finding a Tortoile after the falling in of the River Nilm, whose flesh was dryed up, because it was lest upon the Rocks, he struck the sinews thereof, which by the force of his hand made a musical found, and thereupon he framed it into a Harp, which caused other to imitate his action, and continue that unto this day.

These Tortoises are better meat then the Sea or Water Tortoises: and therefore they are preferred for the belly; especially they are given to Horses, for by them they are raised in slesh, and made much fatter. And thus much shall suffice for the Tortoise of the earth.

of the TORTOISE of the Sweet-water.

Diny maketh four kindes of Tortoifes, one of the Earth, a fecond of the Sea, a third called Lu. I taria, and the fourth called Swyda, living in Sweet-waters, and this is called by the Portugals, Ca-Lado; and Gagado; the Spaniards, Galapag; and the Italians, Gaiandre de aqua. There are of this kinde found in Helvetia, neer to Zwick, at a Town called Andelfinge: but the greatest are found in the River Ganges in India, where their shells are as great as tuns, and Damascen writeth, that he saw certain Embassadours of India, present unto Augustus Casar at Antiochia, a Sweet-water Tortoise, which was three cubits broad. They breed their young ones in Nilm. They have but a small Milt, and it wanteth both a bladder and reins. They breed their young ones and lay their Egges on the dry land, for in the water they die without respiration: therefore they dig a hole in the earth wherein they lay their Egges, as it were in a great ditch, of the quantity of a Birrel, and having covered them with earth, depart away from them for thirty days; afterwards they come again and uncover their Egs, which they finde formed into young ones, those they take away with them into the water : and these Tortoifes at the inundation of Nilus follow the Crocodiles, and remove their nelts and egges from the violence of the flouds.

There was a magical and superstitious use of these Sweet water Tortoises against Hail, for if a man Ellanne. take one of these in his right hand, and carry it with the belly upward round about his Vineyard, and foreturning in the same manner with it, and afterward lay it upon the back, so as it cannot turn on the belly, but remain with the face upward, all manner of Clowds should passe over that place and never empty themselves upon that Vineyard. But such Diabolical and foolish observations were Palladim. not fo much as to be remembred in this place, were it not for their fillineffe, that by knowing

Yyy3

Ælianus•

them, men might learn the weaknesse of humane wisdom when it erreth, from the Fountain of all them, men migut learn the weakhelle of library) and the most approved operations of Nature : And science and true knowledge (which is Divinity) and the most approved operations of Nature : And fo I will say no more in this place of the Sweet-water Tortoife.

of the TORTOISE of the Sea.

TT were unproper and exorbitant to handle the Sea-tortoile in this place, were it not because it T were unproper and exorption to manufe and the land, wherefore feeing the Earth is the liveth in both elements, that is, both the water and the land, wherefore feeing the Earth is the I liveth in both elements, that is, both the water and nourishment, it shall not be amisse nor improplace of his generation, as the Sea is of his food and nourishment, it shall not be amisse nor improplace of his generation, as the Sea is of his food and nourishment, it shall not be amisse nor improplace of his generation, as the Sea is of his food and nourishment, it shall not be amisse nor impro-

place of his generation, as the Sea is or his 1000 and noutrements, a mind not be aimlie nor improper (I truft) to handle this also among the Serpents and creeping things of the earth.

Pliny callett this Sea-tortoife Mus Marinus, a Mouse of the Sea, and after him Albertus doth so

Pliny callett this Sea-tortoife Mus Marinus, and the Partuagle Tarinruga, and in Garman Marin Sea. Pliny cattern this sea-corcoite dean transformed, the Portugals, Tarturuga; and in Germany, Mee febilikon, likewife. The Arabians call it Asfulbafeb; and the Portugals, Tarturuga; and in Germany, Mee febilikon, which the common Fisher-men call the Souldier, because his back seemeth to be armed and covered which the common Fisher-men call the Souldier, because his back seemeth to be armed and covered which the common runer-men can the Socially on the fore-part: which shield is very thick, strong, and trianwith a thield and neimet, especially on the lost-party of his neck, shoulders, and hips, that tie on gular, there being great veins and finews which go out of his neck, shoulders, and hips, that tie on

d tanen the name to me body. His foresfeet being like hands, are forked and twisted very strong, and with which it fightethand and fasten the same to his body. His foresteet being like nands, are followed and the frequent frokes of Hammers. And taketh his prey, and nothing can preffe it to death except the frequent frokes of Hammers. And taketh his picy, and nothing can plantity, and their feet, they are much like the Tortoiles of the in an enter members eacept their quantant and are also black in colour. They pull in their heads as ocearth, for otherwise they are greater, and are also black in colour. earth, for otherwhethey are greater, and ale and black in collection is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover casion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell or cover shell be a supplied to the compounded of shell be a supplied to the compounde or fnouts are certain eminent divided things like teeth, very sharp, and shut upon the under lip like or moute at contract the confidence of the fharp prickles, and the firength of their hands as the cover of a Box, and in the confidence of the fharp prickles, and the firength of their hands

and backs, they are not afraid to fight with men. Their eyes are most clear and splendent, casting their beams far and near, and also they are of white colour, fo that for their brightnesse and rare whitenesse, the Apples are taken out and included in Rings, Chains, and Bracelets. They have reins which cleave to their backs, as the Reins of a Bugle or Ox. Their feet are not apt to be used in going, for they are like to the feet of Seals or Sea-calves, ferving in stead of Oars to swim withall. Their legs are very long, and fronger in their seet and nails,

They live in Rocks and the Sea-fands, and yet they cannot live altogether in the water, or on the then are the claws of the Lion. land, because they want breathing and steep, both which they perform out of the Water yet Pliny writeth, that many times they sleep on the top of the water, and his reason is, because they le fill unmoveable, (except with the Water) and snort like any other Creature that sleepeth, butthe contrary appeareth, seeing they are found to fleep on the land, and the snorting noise they make is but an endeavour to breath, which they cannot well do on the top of the water, and yet better there then in

They feed in the night-time, and the mouth is the strongest of all other Greatures, for with it

they they crush in pieces any thing, be it never so hard, as a stone or such things: they also come and eat graffe on the dry land. They eat certain little Fishes in the Winter time, at which season their mouth is hardest, and with these Fishes they are also baited by men, and so taken. Paulanius writeth, that in Africa that there are Maritine Rocks called Sceleste, and there dwelleth among a creature called Scynon, that is Zylyron, a Tortoife, and what soever he findeth on those Rocks which is ftranger in the Sea, the same he taketh and casteth down headlong. They engender on the Land, and the semale refisteth the copulation with the male, until he fet against her a stalk or stem of sometree or plant. They lay their Egs and cover them in the earth, planing it over with their breaks, and in the night-time they sit upon them to hatch them. Their Egs are great, of divers colourss, having a hard thell, so that the young one is not framed or brought forth within lesse compasse then a year, (as Ariftoile writeth) but Pliny faith thirty days.

And for as much as they cannot by Nature, nor dare for accident long tarry upon the land: they fet certain marks with their feet upon the place where they lay their Egs, whereby they know the place again, and are never deceived. Some again fay, that after they have hid their Egsin the earth forey days, the female cometh the just fortieth day, not failing of her reckoning, and uncovereth her Egs wherein the findeth her young ones formed, which the taketh out as joyfully as any man would do Gold our of the earth; and carryeth their away with her to the water. They lay sometimes an hundred Bgs, and fometimes they lay fewer, but ever the number is very great.

There is upon the left fide of Hispaniola, a little Island upon the Port Beata, which is called Allus Bellus, where Peter Martyr reporteth ftrange things of many creatures; especially of the Tottoiles, for he writeth, that when they rage in luft for copulation, they come on thore, and there they dig a ditch wherein they lay together three or four hundred Egs, being as great as Goofe Egs, and when they have made an and a king and a looking when they have made an and a king a looking when they have made an and a king a looking when they have made an and a king a looking a looking and a looking a looking a looking a looking and a looking a loo when they have made an end, they cover them with fand and go away to the Sea, not once looking after them: but at the appointed time of Nature, by the heat of the Sun, the young Tortoiles at hatched, engendered, and produced into light without any further help of their parents.

Great is the courage of one of thefe, for it is not afraid to fet upon three men together, but if it can be turned upward upon the back, it is made weak and unrefiftible. And it the head be cut off and severed from the body, it dieth not presently, nor closeth the eyes, for if a man shake his hand Elianus. on and revestion with it wink, but if he put it neer, it will also bite if it can reach it. If by the heat of the Sun their backs grow dry, they also grow weak and inflexible, and therefore they hasten to the water to remollifie them, or elfe they die within short time; and for this cause this is the best way to take them. In the hottest day they are drawn into the deep, where they swim willingly with their backs or shells above the water, where they take breath, and in continuance, the Sun fo hardeneth them, that they are not able to help themselves in the water, but they grow very faint and weak, and are taken at the pleasure of the Fisherman.

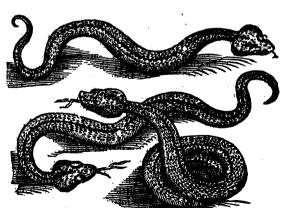

They are also taken on the tops of the water after they return weary from their feeding in the night-time, for then two men may easily turn them on their backs, and in the mean while another casteth a Snare upon them and draweth them safely to the land. In the Phanician Sea they are taken fafely without danger, and generally where they may be turned on their back, there they can make no refistance, but where they cannot, many times they wound and kill the Fisher-men, breaking the nets afunder, and let out all the other Fish included with them.

Bellonim writeth, that there be of these Sea-tortoises two kindes, one long, the other round, and both of them breath at their Nofes, because they want gills, and the long ones are most frequent about the Port Torra in the Red-fea; whole cover is variable, for the males shell is plain and smooth underneath, and the females is hollow. The Turk have a kinde of Tortoile, whose shell is bright like the Chrysolite, of which they make hafts for Knives of the greatest price, which they adorn with plates of gold. In fambolus, an Island of the South, there are also found certain Monsters or living crea- Boemus. tures, which are not very great, yet are they admirable in Nature, and in the vertue of their bloud.

Their bodies are round and like the Tortoife, having two croffe lines over their backs, in the ends of which is an eye and an ear at either fide, fo as they feem to have four ears, the belly is but one, into which the meat paffeth out of the mouth. They have feet round about, and with them they go both backward and forward. The vertue of their bloud is affirmed to be admirable : for whatfoever body is cut asunder and put together, if it be sprinckled with this bloud during the time that it breatheth, it couniteth as before.

The ancient Trogledytes had a kinde of Sea-tortoife, which they call Celtium, which had horns unto which they fastened the strings of their harps; these also they worshipped and accounted very holy. Yet some think that they might better be called Geletum then Celtium; but I think Hermolaus doth better call them Chelisium apotes Cheluos, which fignifieth both a Tortoife and their broad breafts; and with their horns they help themselves in swimming. Albertus also maketh mention of a Tortoile called Barchora, but it is thought to be a corrupt word from Oftra Godermus. These Sea-Tortoiles are found sometimes to be eight cubits broad, and in India with their shells they cover houses, and such use they also put them unto in Taprobana, for they have them fifteen cubits broad. And thus much for all kinde kinde of Tortoiles.

of the VIPER.

Otwithstanding the asse-veration of Suessanus, who will needs exclude the Viper from the Serpents, because a Serpent is called Ophis, and the Viper Echis, yet I trust there shall be no reasonable man that can make exception to the placing of this living creature among Serpents; for that great learned man was deceived in that argument, seeing by the fame reason he might as well exclude any other, as the Snake, Dragon, Scorpion, and such like, who have their peculiar names, besides the generall word Ophis, and yet might he alfo have been better advised, then to affirm a Viper not to be

called a Serpent: for even in Aristotle whom he expoundeth and approveth, he might have found in his fifth Book of Gen. animal. and the last Chapter, that the Viper is recorded, Inter genera opheon: that is, Amongst the general kindes of Serpents, although as we shall shew afterward, it differeth from most kindes of Serpents; because it breedeth the young one in his belly, and in the Winter time lyeth in the Rocks, and among stones, and not in the earth.

The Hibrews as it appeareth, Efa. 59. and Job 6. call it Appenath, and according to Munfier Aphgraim plurally for Vipers, because of the variety of colours, wherewithal they are set all over. The Arabians,

Brafavolus.

Ariftotle.

Oppianus. Plinius.

Plutarch.

Of the Viper

801

Arabians from the Greek word Thereon, fignifying all kinde of wide Beafts, do also call it Thiron, and Arabians from the Greek word a percent, against the call a Alafafral, and Alphai: they also call it that kinde of Viper whereof is made the Triacle, they call a Alafafral, and Alphai: they also call it that kinde of Viper whereor is made the franches Alphe, which seemeth to be derived of the Hebrens, Eofman, (as Leonicenus writeth.) Beside it is called Alphe, which seemeth to be derived of the Hebrens, Eofman, (as Leonicente Willetin.) Delice de arise from the Greek word Opbis. The Greek call the and Afti, which may likewise be conjectured to arise from the Greek word Opbis. The Greek call the and Afti, which may likewise be conjectured to as Echidna, and it is a question whether the vulgar Male peculiarly and properly Echit, and the Female Echidna, and it is a question whether the vulgar Male peculiarly and properly Benn, and the tender of fignific this kinde of Serpent. Bellonius word among the Grecians at this day Ochendra, do not also fignific this kinde of Serpent. Bellonius word among the Circums at this way obtained, as the female Viper. The Germans have many words for a Vithinketh, that it is corrupted of Landing bir a viner, and Viper-nater. The French, une Vipere; the Spaper, as Brandt Schlangen, Ratet-otter, Heck nater, and Viper-nater. The French, une Vipere; the Spaper, as Brandt Schlangen, Ratet-otter, Plant Ratedle South and Comerimes Search per, as Branci Schlaugen, the Iralians, Vipera, Maraffe, Scurito, and fometimes Scorzonei, although niards, Bivora, and Bicha; the Iralians, Vipera, Maraffe, Scurito, and fometimes Scorzonei, although maras, Bruora, and Bicon; although in Italy for all creeping Serpents without feet, and that finke with their teeth.

to their teetil.

There is also about the word Mareso some question, although Leonicenus decideth the matter, and naketh it out of all Controversie, and Rhodiginus thinketh it a very significant word derived from maketh it out of an Controverse, and about Vipers. The Mountebanks do also call Suffit, from Si-the people Marsi, because they carryed about Vipers. the people marji, because they date, the Some will have Nepa to be also a Viper, yet we have shewed bila, the histing voyce which it maketh. Some will have Nepa to be also a Viper, yet we have shewed

that already to lignifie a Scorpion.

The Grecians say, that the Viper is called Echidna, para to echein in eaute ten gonen achrithanaton : beand therefore the Latines do also cause to net own death the because it dyeth by violence of her birth or young: and they attribute call it Vipera, quasi Vi pariat: because it dyeth by violence of her birth or young: and they attribute unto it venom and pestilence, and generally there are few Epithets which are ascribed to the Ser. pent, but they also belong unto this. There is a precious stone Echites, (greenish in colour) which pent, but they also belong and therefore taketh name from it. Also an herb Echite, like Seamnon, seemeth to be like a Viper, and therefore taketh name from it. Also an herb Echite, like Seamnon, and Eshidmon or Viperina. In Cyrene there are Mico, which from the similitude of Vipers are called Echenata. Echion was the name of a man, and Echionida and Echionii, of people; and Echidnon a City beside the Sea Ægeum: Also the Bagle which by the Poets is saigned to eat the heart of Prometheus, is likewise by them said to be begotten betwixt Typhon and Echidna, and the same Echidna to be also the Mother of Coimera: which from the Navel upward was like a Virgin, and downward like a Viper, of which alfo Diodorus Siculus, and Herodotus telleth this ftory :

When Hercules was driving away the Oxen of Geryon, he came into Scythia, and therefell asleep, leaving his Mares feeding on his right hand in his Chariot, and so it happened by divine accident, that whiles he slept they were removed out of his fight and strayed away from him. Afterward he awaked, and missing them, sought all over the Countrey for them; at last he came unto a certain place, where in a Cave he found a Virgin of a double natured proportion, in one part retembling a Maid, and in the other a Serpent, whereat he wondered much, but the told him, that if he would lie with her in carnal copulation, the would thew him where his Mares and Chariot were : whereunto he consented, and begat upon her three Sons, famous among Poetical Writers: Namely, Age. thyrsus, and Southus: but I will not prosecute either the names, or these sables any surther, and so I will proceed to the description of Vipers. The colour of Vipers is somewhat yellowish, having upon their skin many round spots, their length about a cubit, or at the most three palms. The tail curled, at the end very small and sharp, but not falling into that proportion equally by even attenuation, growing by little and little, but unevenly tharped on the sudden from thickneffe to thinneffe. It is also without flesh, consisting of skin and bone, and very sharp. The head is very broad, compared with the body, and the neck much narrower then the head; the eye very red and flaming, the belly winding, upon which it goeth all in length, even to the tail, and it goeth quickly and nimbly : fome affirm that it hath two canine teeth, and fome four. And there is some difference betwixt the male and female; the female hath a broader head; the neck is not fo eminenta shorter and thicker body, a more extended tail, and a softer pace, and sour canine teeth. Again, the male hath a narrower head, a neck fwelling or flanding up, a longer and thinner body, and a swifter pace or motion, fo that in the Pictures proposed in this discourse: the first of them are for the male, and the last for the female & this is the peculiar outward difference betwixt the male and the female Vipers. Avicen faith belides, that the tails of Vipers make a noise when they go or move. Those are taken to be the most generous and lively, that have the broadest and hollowest head like a Turbot, quick and lively eyes, two canine teeth, and a griffle or claw in the nofe or tail; a short body or tail, a pale colour, a switt motion, and bearing the head upward. For the further description of their several parts. Their teeth are very long upon the upper chap, and in number upon either fide four, and those which are upon the neather gum are so small, as they can scarce be discerned, until they be rubbed and pressed; but also it is to be noted, that while they live, or when they be dead, the length of their teeth cannot appear, except you take from them a little bladder, in which they lie concealed. In that bladder they carry poyfon, which they infuse into the wound they make with their teeth: they have no ears, yet all other living creatures that generate their like, and bring forth out of their bellies have ears, except this, the Sea-calf, and the Dolphin, yet in stead hereof, they have a certain griftly cave or hollownesse in the same place where ears should stand. The womb and place of conception (saith Pliny) is double, but the meaning is, that it is cloven as it is in all females, (especially Women and Cows.) They conceive Egges, and those Egges are contained neer their reins or loins. Their skin is fost, yeelding also to any stroke ; and when it is fleyed off from the body, it stretcheth twice so big as it appeared while it covered the living Serpent To conclude, Phyliologue writeth, that their face is somewhat like the face of a man, and from the Navel it refembleth a Crocodile, by reason of the small passage it hath for his egestion which exceedeth not the eye of a Needle. It conceiveth at the mouth. And thus much for the description in

There is some difference among this kind also, according to the distinction of place wherein they live, for the Vipers in Ethiopia are all over black like the men, and in othes Countrevs they differ in colour, as in England, France, Italy, Greece, Afia, and Egypt, as writeth Bellonius. There is fcarce any Nation in the World wherein there are not found some Vipers. The people of Amitte which Herodottes. were of the Grecian bloud, drove away all kind of Serpents from among them, yet they had Vipers which did bite mortally; and therefore could never becured, being shorter then all other kinds of

Vipers in the World.

Likewise in Arabia, in Syagrus, the sweet Promontory of Frankincense, the European Mountaines. Seron, Pannonia, Afelenus, Corax, and Ripham: the Mountaines of Afta, Egages, Bucarteron, and Cerembus, abound with Vipers. Likewise Egypt, and in all Africa they are found also, and the Africans affirm, (in deteftation hereof) that it is not fo much Animal, as Malum natura: that is, A living Creature, as evill of Nature: To conclude, they are found in all Europe. Some have taken exceptions to Crete, because Aristotle writeth, that they are not found there, but Bellonim affirmeth that in Crete also he saw Vipers which the Inhabitants call by the name of Cheudra, which seemeth to be derived from the Greek Echidna. At this day it is doubted whether they live in Italy, Germany, or England, for if they doe, they are not knowne by that name: yet I verily think that we have in England a kinde of yellow Adder which is the Viper that Bellonine faw here, for I my felfe have killed of them, not knowing at that time the difference or similitude of Serpents, but since I have perceived to my best remembrance that the proportion and voyce of it did shew that it was a Viper. The most different kinds of Vipers are found in Ægypt and Afia.

Concerning the quantity, that is the length and greatnesse of this Serpent, there is some difference, for some affirme it to be of a cubit in length, and some more, some lesse. The Vipers in Europe are very small, in comparison of them in Africa, for among the Troglodytes (as writeth Elianus) they are fifteen cubits long, and Nearobus affirmeth as much of the Indian Vipers; Ariftobulus also writeth of a Viper that he faw one, which was nine cubits long, and one hand breadth: & fome again (as Strabo) affirm, that they have seen Vipers of sixteen Cubits long, and Nicander writeth thus of the Vipers

of Afra;

Fert Asia ultra tres longis qui tracibus ulnas Setendant rigidum quales Bucarteron, atque Arduns Aegagus, & celsus Cercaphus intra Se multos refovet.

In English thus;

Such as Affa yeelds in length, as are three elles, In Bucarteron fleepy rough, thefe Vipers flourish, Hard Egagus and high Cercaphus cels, Within their compaffe many fuch de nourifh.

Others there be in Afia fixteen foot long, and some there beagain twenty, as in the Golden Cassiglia, where their heads are like the heads of Kids. There be some that make difference betwixt Echir and Echidna, because one of them when it biteth, causeth a convulsion, and so doth not the other, and one of them maketh the wound look white, the other pale, and when the Echis biteth Scaliger; you shall see but the impression of two teeth, and when the Echidna biteth you shall see Cardan. the impression of more teeth. But these differences are very idle, for the variety of the pain may arise from the constitution of the body, or the quantity of the poyson, and so likewise Elianm. of the colour of the wound, and it is already fet down, that the Echie or Male Viper hath but two Canine teeth, but the other, namely, the Echidna hath four : thus faith Nicander;

Masculus emittit notus color ipse caninos Binos perpetuo monstrat, sed fæmina plures. Which may be englished thus; The Male two canine teeth, whose colour well is known, But in the Female more continually are shown.

But yet the Male hath beside his Canine teeth, as many as hath the Female: and besides the Male is known from the Female, as the same Nicander writeth, because the Female when she goeth, draweth her tail as though she were lame, but the Male more manlike and nimble, holdeth up his head, ftretcheth out his tail, restraineth the breath of his belly, fetteth not up his Scales (as doeth the Female;) and besides, draweth out his body at length.

The Meate of these Vipers are green Hearbes, and also sometimes living Creatures: and namely, Galen. Hore-flies, Cantharides, Pibliocamper, and fuch other things as they can come by, for these are fit and convenient meat for them. Ariffetle writeth, that sometimes also they eat Scorpions, and in Arabia they not onely delight in the sweet juyce of Ballam, but also in the stradow of the same. But above all kinds of drink, they are most infaciable of wine. Sometime they make but little folds, and sometime

Cardan.

Ariftotle.

Aristotle.

greater, but in their wrath their eies flame, they turn their tailes and put forth their double tongue. greater, but in their wrach their cles hade, they live in the hollow Rocks, yet Pliny affirmeth, that In the winter-time as we have faid already, they live in the hollow Rocks, yet Pliny affirmeth, that In the winter-time as we have land an early, that then also they enter into the earth, and become tractable and tangible by the hands of man, for in then ano they enter into the carring for fierce as they are in the hot, and in the Sommer also they are the cold weather they are nothing so fierce as they are in the hot, and in the Sommer also they are the cold weather they are nothing to here a serious. They are most outragious in the Canicular not at all times alike furious, but like to all other Serpents. They are most outragious in the Canicular not at all times alike jurious, out like Coalitational disquiet move up and down till they are dead or daies, for then they never rest, but with continual disquiet move up and down till they are dead or daies, for then they never ren, but white extended their heat. Twice in the year they cast their emptied of their poyson, or feel an abatement of their heat. Twice in the year they cast their emptied of their poyson, or feel an abatement of their heat. emptied or their poyion, or let all abatements and in the spring time when they come skins, that is to say, in the Spring, and in the Autumn: and in the spring time when they come out of their hole or winter lodgings, they help the dimnesse of their eye-fight by rubbing their eyes out or their note or whiter toughts, their copulation and generation, I find much difference among writing on fennel. But concerning their copulation and generation, I find much difference among writing of the state of the sta upon tennel. But concerning their copies to be known, I will first of all fet down the opinion of other ters: wherefore in a matter so necessary to be known, I will first of all fet down the opinion of other ters: wherefore in a matter to incertain, after and conclusion, I will be bold to interpose my men, as well Historians as Poets, and then in the end and conclusion, I will be bold to interpose my men, as well Historians as Poets, and then in the end and conclusion, I will be bold to interpose my men, atwell rintorians as roces, and the state of the Reader. Herodotus in his Thalia writeth, that own judgment for the better information of the Reader. Herodotus in his Thalia writeth, that own judgment for the better information of the couple one with another, the Male cometh and when the Vipers begin to rage in luft, and defire to couple one with another, the Male cometh and when the Vipers begin to rage in luft, and defire to couple one with another, the Male cometh and when the vipers begin to rage in lun, and all who is so insatiable in the desire of that copulation, putteth his head into the mouth of the semale, who is so insatiable in the desire of that copulation, putteth his nead into the mouth of the tall his feed-genital, and fo would draw forth his head again, that when the male hath filled her with all his feed-genital, and fo would draw forth his head again, that when the male that miles her husband, whereby he dieth and never liveth more: but the the hitch it off, and destroyeth her husband, whereby he dieth and never liveth more: but the the biteth it on, and dentoyeth her young in her belly, who every day according to natures inclifemale departeth and conceiveth her young in her belly, who every day according to natures inclifemale remaie departetti and control and ripenesse, and at last in revenge of their fathers death, do likewife nation, grow to perfection and ripenesse, and at last in revenge of their fathers death, do likewife nation, grow to perfection and arterior belly, and by an unnatural iffue come forth into the light destroy their mother, for they eate out her belly, and by an unnatural iffue come forth into the light

Avicenna.

of this world: and this thing is also thus witnessed by Nicander; Cum durum fugiens morfu ignescentis echidua Frendit echin vel ubi fervente libidinis aftu Savo dente sui resecat caput illa mariti: Aft ubi poft vegetam ceperunt pignora vitam,

Fam propinqua adfunt maturi tempora partu. Indignam chari mortem ulciscentia patris, Erofa miferæ nascuntur matrie ab alvo.

When the male Viper gnasheth, avoyding females bite, Whose fiery rage is all on ardent luft, Tet when he burnes for copulation right, Her cruel tooth doth Husbandhead off crush.

In English thus; But yet alaffe, when feeds begins to live, And birth of young ones ripen in her womb, Then they for Fathers death a full revenge de give. Eating forth their wretched mothres ftrong.

Vnto this agreeth Galen, Isidore, Plutarch, Elianus: and Lucan who writeth;

Viperei coeunt abrupto corpore nati That is to fay: The geniture of Vipers blood Engender, breaking bodies good.

Pliny agreeth with the residue for the death of the Male in carnal copulation, but he differeth in this, about the Female, affirming that when the young Vipers grow ripe and perfect in their Mothers belly, the casteth forth every day one for three daies together, (for her number is sometimes twenty) at last the other, impatient of delay, gnaw out her guts and belly, and so come forth, destroying their mother: And here is no great difference, for in the sum and destruction of Father and Mother they all agree, and Saint Ferom, Saint Basil, and Horus do agree and subscribe to the truth of these opinions. Thus we have shewed the opinions of the Ancient and first Writers; now it followeth that we should likewise shew the opinions of the latter Writers, which I will performe with as great brevity and perspicuity as I can. Pierius therefore writeth, that in his timethere were Learned men desirous to know the truth, who got Vipers, and kept them alive, both Males and Females, by shutting them up safe where they could neither escape out, nor do harme, and they found that they engendred, brought forth, and conceived like other Creatures, without death

Amatus Lusitanus also writeth thus. The Male and Female Viper engender by wreathing their or ruine of Male and Female. tails together, even to the one half of their body, and the other half standeth upright, mutually kissing one another. In the Male there is a genital member in that part beneath the Navel, where they embrace, which is very secret and hidden, and against the same is the Females place of conception, as may appear manifestly to him that will look after the same; and therefore all the Philosophers and Physicians have been deceived, that have wrote they have conceived at their mouth, or that the Male perished at the time of engendering, or the Female at the time of her

Theophrafiu he likewise writeth in this manner; The young Vipers do not eate out their way, delivery. Thus faith Amorus. or open with their teeth their Mothers belly, nor (if I may speak merrily) make open their own passage by breaking up of the doors of their Mothers womb, but the womb being narrow, cannot contain them; and therefore breaketh of it own accord: and this I have proved by experience, even as the fame falleth out with the fish called dow: and therefore I must crave pardon of Herodotte, if I affirm his relation of the generation of Vipers to be meetly fabulous. Thus far Theophraftw.

Apollonius also writeth, that many have seen the old Vipers licking their you g ones like other

Thus have I expressed the different judgements of fundry Authors both new and old touching Calius. the generation of Vipers, out of which can be collected nothing but evident contradictions, and unreconcileable judgements, one mutually crossing another. So as it is unpossible that they should be both true, and therefore it must be our labour to search out the truth, both in their words, and in the conference of other Authors. Wherefore to begin, thus writeth in their The Viper amongst other Serpents, almost alone bringeth forth a living creature, but first of all the conceiveth a foft egge of one colour, above the egges lieth the young ones folded up in a thin skin, and some-times it falleth out, that they gnaw in funder that thin skin, and so come out of their mothers belly all in one day, for she bringeth forth more then twenty at a time.

Out of these words of Arffotle, evilly understood by Pliny and other ancient Writers, came that errour of the young Vipers eating their way out of their mothers belly, for in flead of the little thin skin which Aristotle faith they eat thorough, other Authors have turned it to the belly, which was clean from Arifotles meaning. And another error like unto this, is that wherein they affirm, that the Viper doth every day bring forth one young one, fo that if she hath twenty young

ones in her belly, then also she must be twenty dayes in bringing of them forth.

The words of Aristotle from whence this error is gathered, are these, Telles de en mis emera kathon, Titlei de plo be eikofi, which are thus translated by Gaza, Parit enim singulos diebus singulis, plures quam viginti numero: That is to fay, the bringeth forth every day one, more then twenty in number. But this is an abfurd translation, and agreeth neither with the words of Ariffolle, nor yet with his mind, for his words are thefe: Parit autem una die singulos, parit autem plus quam viginti numero That is to fay in English, the bringeth forth every one in one day, and the bringeth forth more then twenty: fo that the sense of these words shall be; that the Viper bringeth forth her young ones severally, one at a time, but yet all in a day.

But concerning her number, neither the Philosopher, nor yet any man living, is able to define and fet it down certain, for they vary, being sometimes more, and sometimes fewer, according to the nature of other living creatures. And although the Viper do conceive egges within her, yet doth the lay them after the manner of other Serpents, but in her body they are turned into living Vipers, and so the egges never see the sun, neither doth any mortal eye behold them, except by accident in the diffection of a female Viper when the is with young. I cannot also approve them that do write, that one, namely the Viper, among all Serpents, bringeth forth her young ones alive, and perfect into the world, for Nicander and Grevinus, do truly affirm, with the constant consent of all other Authors, that the horned Serpent called Ceraftes, of which we have spoken already, dothlikewise bring forth her young ones alive. And besides, Herodotus writeth of certain winged-Serpents in Arabia, which do bring forth young ones as well as Vipers, and therefore it must not be concluded with apparent falfhood, that onely the Viper bringeth her young ones perfect into

The like fable unto this, is that general conceit of the copulation together, betwixt the Viper and the world. the Lamprey; for it is reported that when the Lamprey burneth in lust for copulation, the forsketh the waters, and cometh to the Land, seeking out the lodging of the male Viper, and so joyneth herselse unto him for copulation. He againe on the other side, is so tickled with desire hereof, that forfaking his own dwelling and his own kind, doth likewife betake himfelfe unto the Waters and Rivers fides, where in an amorous manner, he hiffeth for the Lamprey, like as when a young man goeth to meet and call his Love; fo that these two creatures, living in contrary elements, the earth and the water, yet meet together for the fulfilling of their lufts in one bed of fornication. Upon which Saint Bafill writeth in this manner: Vipera infestissimum animal eorum que Sommer cum murena congreditur, &e. that is to say, the Viper a most pernicious enemy to all living creeping things, yet admitteth copulation with the Lamprey, for he forfaketh the Land, and goeth to the water-fide, and there with his hiffing voyce, giveth notice to the other of his presence, which she hearing, inflantly for saketh the deep waters, and coming to the Land, fuffereth herself to be imbraced by that venemous beaft. Also Nicander writeth thus thereof in his verses.

> Fama est, si modo vera, quod bec sua pascua linquat, Atque eat in siccum cogente libidine littus, Et cum Vipereo coiens serpente gravetur, Which may be englished thus; Fame faith (if it be true)that fhe ber feed for akes, I mean the shore, and goes upon dry land. Where for her lust the Viper -male she takes, In fleshly coiture to be ber husband.

But this opinion is vaine and fantasticall, as Pliny and divers others have very learnedly proved, for the Lamprey cannot live on the Land, nor the Viper in wet places, besides the waters: and therefore, besides the impossibility in nature, it is not reasonable that these will hazard their own lives, by forfaking their own elements for the satisfaction of their lufts, there being plenty of either kinds to work upon, that is to fay, both of female Vipers in the Land, to couple with the male, and male Lampreys in the water, to couple with the female.

Although I have else-where confuted this error, yet I must here again remember that which is faid Attnough I have the which is fable is this; the male Lamprey is exceeding like a Viper, for they want already. The occasion of this fable is this; the male Lamprey is exceeding like a Viper, for they want already. already. The occasion of this book one one by chance feeing in copulation with his female, did rafily feet, and have long poules, which fome his likeneffe, as afore-faid; and therefore they devised a name judge it to be a Serpent because of his likeneffe, as afore-faid; and therefore they devised a name jor it, calling it Myrus, which some have made a kind of Viper, and others a Snake: but Andreas for it, calling it Myrus, which some have made a kind of Viper, and others a Snake: but Andreas hath notably proved against Archelaus, that this Myrus neither is nor can be any other then the hath notably proven against stress, that neither Vipers ingender with Lampreys, nor yet male Lamprey: and to the world by the female Vipers kill the male in copulation, or that the young ones come into the world by the destruction of their dams.

Alianus.

Strabo.

in the next place we are to confider, the antipathy and contrariety that it observeth with other In the next place we are to betwixt it and others. First of all therefore it is certain and well creatures, and the amity also betwixt it and others. First of all therefore it is certain and well creatures, and the annity and betwixt man-kind and Vipers, for the one alwaies hateth and feareth known, what great enmity is betwixt man-kind and Vipers, for the one alwaies hateth and feareth known, what great country is an take a Viper by the neck, and spit in his mouth, if the spittleslide the other: wherefore, if a man take a Viper by the neck, and spit in his mouth, if the spittleslide down into his belly, it dieth thereof, and rotteth as it were in a confumption. Vipers also are enemies downinto ins very seather to Oxen, as Virgil writeth, Pesti acerba bonum pecorique aspergere virus: that is, a sharp plague of Oxen, casting his poyson upon all other Cattel. They are also enemies to Hens and Geese, as Onen, canning in wherefore in ancient time they were wont to make fure walls for the custody of their pullen against Vipers. They are likewise enemies to the Dormouse, and they hunt very greet their punen against vigen whereof Epiphanius in a discourse against Origen writeth thus; When dily after their young ones, whereof Epiphanius in a discourse against Origen writeth thus; When the Viper cometh to the nest of a Dormouse, and findeth there her young ones, she putteth out all their eies, and afterwards feedeth them very fat, yet killeth every day one, as occasion of hunger ferveth ; but if in the mean time a man , or any other creature do chance to eate of those Dormice, whole eies are fo put out by the Viper, they are poyfoned thereby. And this is a wonderfull work in nature, that neither the little Dormice receive harme by the poyfon, but grow fat thereby, nor yet the Viper be poyfoned herfelf while the eateth them, and yet a man or beaft which is a stranger unto it, dieth thereof.

All kind of Mice are as much afraid of Vipers, as they be of Cats, and therefore whensoever they heare the histing of a Viper, instantly they look to themselves and their young ones. There is a kind of harmelesse Serpents called Parea, whereof I have spoken before in his proper place, which is an enemy unto Vipers, and that same which is harmlesse unto men, killeth them. Albeitwalfo telleth a flory of a Viper that climbed up into a tree, to the nest of a Magpye, where upon the old one was fitting, this poore Pyedid fight with the Viper, untill the Viper took her fast by the thigh, fo as the could fight no more, yet the ceased not to chatter and cry out to her fellows to come and help her, whereupon the male Pye came, and feeing his female fo griped by the Viper, he ceased not to peck upon his head untill the braines came out, and so the Viper fell down dead.

This story is also alledged by Cardan.

The Scorpions and the Vipers are enemies one to another, for at Padua a Viper and a Scorpion (for the trial of this matter) were both included in a vial, where they continued fighting a little while, but at last they both died by one anothers poylon. The Tortoyse of the earth is also an enemy to the Viper, and the Viper to it, wherefore if it can get Origan, or wild-Savory, or Rue, it eateth thereof, and then is nothing afraid to fight with the Viper , but if the Tortoyle can find none of thefe, then they die incontinently by the poylon of the Viper, and of this there hath been

triall , as both Aristotle and other Authors affirm.

And as there is this contratiety betwixt Vipers and other living creatures, fo there is betwixt them and Plants of the earth, and this bleffing God in nature hath bestowed upon many beasts, that when they feel themselves to be hurt by one herb, they know another to cure them; as forexample, Garlick is poyfon to the Viper, and therefore having tafted thereof the dieth, except the eat some Rue. A Viper being strook with a Reede once, it amazeth her, and maketh her fenfelesse, but being flook the second time, she recovereth and runneth away: and the like is reported of the Beech-tree, faving that it stayeth the viper, and she is not able to go from it. But most marvailous is the antipathy betwixt the Viper and the Yew-tree, for it is reported by Mercuriall, that if you lay fire on the one fide, and a peece of Yew on the other fide, and then place a viper in the middle betwixt them both, she will rather chuse to runne thorow the fire, then to go over the branches of

Gallen.

Ælianw

The Viper is also afraid of Mustard-seed, for it beeing laid in her path, she flieth from it, and if the taste of it, the dieth. There is an herbe called Arum, if the hands or body of a man be anointed with the juyce of the root thereof, the viper will never bite him; the like is reported of the juyce of Dragons, expressed out of the leaves, fruit or root. It is also said, that if a viper do behold a good Smaradge, her eyes will melt and fall out of her head. But above all other plants in the world, the Viper is most delighted with Vetches, and the Savyne tree, for in Italy (as Cardan with teth) there was once seen a great number of Vipers about a Savyne Tree, and many of them did

Diescorid. Rafis,

There is no love betweene this Serpent and other creatures, fave onely to his own kind, and there climbe up and down upon that Tree. fore there are two things memorable in the nature of this favage Serpent, the one is the love of the male to the female, and the other of the female to her young ones. It is reported by Saint Ambrote and Saint 8600 about 18600 and and Saint Befill, that when the male miffeth the female, he feeketh her out very diligently, and with a pleafing and flattering noyle, calleth for her, and when he perceiveth the approcheth, he salleth up all his venome, as it were in reverence of matrimonial dignity. The female on the other side, maketh much of her young ones, licking and adorning their skins, fighting for them unto death. maketu must be and beafts. For this occasion and some medicinal uses, the Arabians counted both against men and beafts. both against the Arabians counted Vipers holy Serpents, for by reason (as we have said already) that the Vipers do haunt the Bal-Vipers many thereof there be plenty in that countrey, they hold them for holy keepers of that prefom-trees, wherefore they never kill them, but at the time of year when the Balfom is ripe, they come unto the trees bearing in their hands two woodden rules, which they finite one against they come unto the trees bearing in their hands two woodden rules, which they finite one against they come unto the noise whereof the Vipers are terrified and driven away, and so the Trees are freed another, by the noise whereof the finite thereof a chain and the finite thereof a chain and the finite thereof a chain and the finite thereof and the finite the finite thereof and the finite thereof and the finite thereof and the finite thereof and the finite the finite the finite thereof and the finite thereof and the fin another, by the Inhabitants to take the fruite thereof at their pleasure.

Now for a finuch as we read that Porm King of India fent many great Vipers for a gift unto Auguhow to take the meanes whereby Vipers are fafely taken without doing any harme. Wherefore Ariffete writeth, that they are very much defirous of Wine, and for that cause harme. When people fet little vessels of wine in the hedges and haunts of Vipers, whereunto the the Country reality drink themselves tame, and so the Hunters come and kill them, or else so vipers to are without danger of harm. Pliny reporteth, that in ancient time, the Martike them, as they are without danger of harm. take them, did hunt Vipprs, and never received harm of them, for by a fecret and innate vertue, fant in Living and ferpents are afraid of their bodies, as we have already shewed in other places. Yet all vipers and fourfe to Pife, writeth that the Marfiant in his time had no fuch vertue in them, as he had often tried, fave onely that they used a deceit or sleight to beguile the people, which was in this manner following.

Long after the usual time of hunting Vipers, they use to goe abroad to take them, when there is no courage nor fcant any venom left in them, for the Vipers are then eafily taken if they can be found; and them fo taken, they accustome to their own bodies, by given them such meats as doth evacuate all their poison, or at the least-wife doth fo stop up their teeth, as it maketh the harm very [mall : and fo the simple people being ignorant of this fraud, and feeing them apparently carrying Viners about them, did ignorantly attribute a vertue to their natures, which in truth did not belong unto them. In like manner there were (as hath already in another place been faid) certain Iuglers in Italy, which did boaft themselves to be of the linage of Saint Paul, who did so deceitfully carry themselves, that in the presence and fight of many people, they suffered Vipers to bite them without any manner of harm.

Others again when they had taken a Viper, did drown her head in mans spittle, by vertue whereof the Viper began to grow tame and meek. Besides this, they made a certain oyntment which they fet forth to fale, affirming it to have a vertue against the biting of Vipers, and all other Serpents, which oyntment was made in this manner. Out of the oyl of the feed of Wild-radish, of the roots of Dragons, the juyce of Daffadil, the brain of a Hare, leaves of Sage, Sprigs of Bay, and a few fuch other things, whereby they deceived the people, and got much money: and therefore to conclude, I cannot find any more excellent way for the taking and destroying of Vipers then that which is already expressed in the general discourse of Serpents.

Wedoread that in Egypt they eat Vipers and divers other Serpents, with no more difficulty then they would do Beles, fo do many people both in the Baftern and western parts of the New-foundlands. And the very felf-same thing is reported of the Inhabitants of the Mountaine Athor, the which meatthey prepare and dreffe on this manner. First they cut off their heads and also their tailes. then they bowel them and fait them, after which they feethe them or bake them, as a man would feethe or bake Eeles, but sometimes they hang them up and dry them, and then when they take them downagain, they gat them with Oyl, Salt, Anyseedes, Leeks and water, with some such other observations. Whose diet of eating Vipers I do much pity, if the want of other food constrain themthereunto; but if it arise from the insatiable and greedy intemperancy of their own appetites. I judge them eager of dainties, which adventure for it at such a market of poyson.

Now it followeth that we proceed to the handling of that part of the Vipers story, which concerneth the venom or poison that is in it, which must begin at the consideration of temperament of this Serpent. It is some question among the learned, whether a Viper be hot or cold; and for anfwer hereof it is faid, that it is of cold constitution, because it lieth hid, and almost dead in the Winter-time, wherein a man may carry them in his hands without all hurt or danger : and unto this opinion for this felf same reason, agreeth Galen. Mercuriall maketh a treble diversity of constitution among Serpents, whereof the first fort are those that with their wound do infuse a mortal poyfon that killethinftantly, and without delay : a fecond fort are those that kill, but more leafurely, without any fuch speed: and the third are those whose poyson is more slow in operation then is the second, among which he assigneth the Viper. But although by this slowness of operation he would inforce the coldness of the poyson, yet it is alwaies to be considered, that the difterence of Vipers, and of their venom, arifeth from the place and region in which they are bred, and also from the time of the yeer wherein they bite and wound, so that except they fortune to hurt any one during the time of the Canicular daies, (in which feason their poylon is hottest, and themselves most full of spirit) the same is but weak, and full of deadness. And again it is to be confidered, whether the Viper harm in her mood and fury, for anger doth thruft it forth more fully, and causeth the same to work more deadly.

Like-

Zzz

Likewise the Region wherein they live, begetteth a more lively working spirit in the Serpent, and therefore before all other, the Vipers of Numidia are preferred, because of the hear of that Countherefore perore an other, the special transfer of poylon, for those that live in the woods and eat Toades, are not fo vigorous or venemous, but those that live in the mountaines, and eat the eat 10 anes, are not to vigorous poyfonful and deadly. And therefore Cardan relateth a flory, which he faith was cold him by a Phanician, that a Mountain-Viper chafed a man fo hardly, that he which ne fatth was told fill by a swallen, that he was forced to take a tree, unto the which when the Viper was come, and could not climbe up to utter was forced to take a tree, unto the fame upon the Tree, and by and by after, the man in the tree dyed, by the fa vour and fecret operation of the fame.

But of the Arabian Vipers which haunt the Balfom-trees, I have read, that if at any time they But of the Arabian vipers which had the pricks of yron, voide of poison, because while they fack in bite, they onely make a wound like the pricks of yron, voide of poison, because while they such in the juyce of that tree, the acerbity and ftrength of the venom is abated. About the Mountain Helion in Greece, the poison also of Vipers is infirme and not strong, so that the cure thereof is also ready and in Greece, the ponon and of vipers poison, I can say no more then Wippim hath said, that it is of it easie. But yet for the nature of Vipers poison, I can say no more then Wippim hath said, that it is of it eatie. But yet for the nature of vipers points, and his reason is, because he saw a combat in a glasse betwirt 2 self and in it selfe considered, hot: and his reason is, because he saw a combat in a glasse betwirt 2 viper and a Scorpion, and they both perished one by the others poison. Now he saith that it is granted, the Scorpion to be of a cold nature, and his poison to be cold; therefore by reason of the anted, the Scorpion to be of a cold nature, and his poison to be cold; tipathy whereby one died by the malice of another, it must needs follow that the Viper is hot, and her poison likewise of the same nature. For a Serpent of a cold nature, killeth not another of the fame nature, nor a hot Serpent, one of his own kind, but rather it falleth out clean contrary, that the hot kill those that are cold, and the cold Serpents the hotter.

All the Vipers that live neer the waters, are of more mild and meek poison then others. If there be any fuch, but I rather beleeve there be none, but that the same Author which wrote of the Vipers of the water, did intend Serpents of the water. But concerning the poison of Vipers, there is no. thing reported more strange then that of Vincentius Belluacensis, who writeth, that if a man chance to tread upon the reynes of a Viper unawares, it paineth him more then any venome, for it spreadeth it self over all the body incurably. Also it is written, that if a woman with child chance to passe over a Viper, it causeth her to suffer abortment; and the Mushroms or Toade-stooles which grow neere

the dennes and lodgings of Vipers, are also found to be venemous.

The Scythians also do draw an incurable and unresistable poison out of Vipers, wherewithall they anoint the sharp ends of their darts and arrowes when they goe to warre, to the end that if it chance to light upon their adversary, he may never any more do them harm. They make this poilon in this manner. They observed the littering places and time of the Vipers, and then with strength and Art, did take the old and young ones together, which they prefently killed, and afterward fuffered them to lie and rot, or foake in some moist thing for a season ! then they took them and put them into an earthen pot filled with the bloud of some one man; this pot of mans bloud and Vipets they stopped very close, so as nothing might issue out at the mouth, and then buried or covered it all over in a dunghil, where it rotted and consumed a few daies, after which they uncovered it again, and opening it, found at the top a kind of watery substance swimming, that they take off, and mixe it with the rotten matter of the Viper, and hereof make this deadly poison.

We have shewed already, that there is outwardly a difference betwixt the biting wound of the Male and the Female Viper, for after the male hath bitten, there appeareth but two holes, but after the Female hath bitten, there appeareth foure; and this is also a great deal more deadly then is the biting of the male, according to the verses of Nicander where he faith ,

Porro ex Vipereo quod nor is germine pejor Famina : que veluti majori accenditurira, Sie vehemente magis fert noxia vulnera morfu, Et plus gliscenti se cauda & corpore volvit, Vnde citation hac illos mors occupat artm.

But of the Vipers brood the female is the worft, Which as it were with greater wrath doth burn: (curft And therefore when she bites, makes bodies more ac- Whereby a speedier death doth life 'rid out.

Which may be englished thus; Inflickting burtful wounds, to vebemency turnd. Rowling her bulke and taile more oft about,

But Avicen is directly contrary to this opinion, and faith, that as the bitings of male Dragons are more exitiall and harmful then are the females, fo is it betwirt the biting of the male and female Viper. This contrarictie is thus reconciled by Mercuriall, namely, that it is true, that the wounds which the female maketh by her biting, being well confidered, is more deadly then the wounds which the male giveth : yet for the proportion of the poison which the male venteth into the wound he maketh, it is more deadly then is the feniales : fo that with respect of quantity: they both fay true which affirm either the one or the other. But which foever is the greateft, it skilleth not much, for both are deadly enough, as may appear by the common fymptoms and fignes which follow, and also

Mulbiolim reporterh a history of a Country-man, who as he was mowing of graffe, chanced to cut a Viper clean afunder about the middle, or some-what nearer the head, which being done, he food ftill, and looked upon the dying differered parts a little while, at last, either presuming that it had no power left to hurt, or thinking it was dead, he took that part in his hand where upon the head was; the angry Viper feeling his adversaries warm hand, turned the head about, and bit his finger with all the rage, force, and venom that it had left, fo that the bloud issued out. The his tinger with all the 1984, defend and the state of the bloud filled out. The man thus bitten for his boldnesse, did hastily cast it away, and began to suck the wound, putting man thus bitten for his boldnesse, be had done but a live land. man trius pitterness. Which when he had done but a little while, he fuddenly fell down dead.

nand to his instance this, is related by Amatus Lufttanus of another, which more boldly then wifedid adventure to take a live Viper into his hand upon a wager of money, but as the other, fo ly, and adventures, for the angry Viper did bite him as did the former, and he sucked his wound this paid for his rashnes, for the angry Viper did bite him as did the former, and he sucked his wound

as did the Country-man, and in like manner fell down dead. By both which examples, we may well see the danger of the Vipers poison, so that if once it some into the Romack, and touch the open passage where the vitall parts goe in and out, it never some into the industry, and out, it never flags faith well, that fometimes it killeth within stayeth long but death followeth. Wherefore Active faith well, that fometimes it killeth within the space of seven houres, and sometimes again within the space of three daies, and that respite of time feemeth to be the longest, if remedie be not had with more effectual speed.

The fignes or effects of the Vipers biting, are briefly these, first there issueth forth a rotten matter, fometimes blou dy, and fometimes like liquid or molten fatnesse, fometimes again with no colour at all, but all the flesh about the fore swelleth, sometimes having a red, and sometime a pale hiew or colour upon it, iffuing also forth a corrupted mattery matter. Also it causeth divers pate men to arife upon the flesh as though the body were all scorched over with fire, and spec-

dily after this, followeth putrefaction aud death.

The pain that cometh by this Serpents wounding, is so universal, that all the body seemeth to be fet on fire, many piciful noyfes are forced out of the parties throat by fenfe of that pain, turning and crackling of the neck, also twinckling and wrying of the eyes, with darknesse and heavinesse of the head, imbecillity of the loynes, fometimes thirfting intolerably, crying out upon his dry throzte, and again sometimes freezing at the fingers ends, at least so as he feeleth such a pain. Moreover, the body sweating a sweat more cold then snow it self, and many times vomiting forth the bilious tumors of his owne belly. But the colour going and coming is often changed, now like pale lead, then like black, and anon as green as the rust of brasse, the gums flow with bloud, and the Liver it felf falleth to be inflamed, fleepinesse and trembling possesset the body and several parts, and difficulty of making urine, with Feavers, neezing and shortnesse of breath.

These are related by Actim, Aegineta, Grevinus and others, which work not alwaies in every body generally, but some in one, and some in another, as the humors and temperament of nature doth lead, and guide their operation. But I marvail from whence Plate in his Symposium had that opinion that a man bitten and poisoned by a Viper, will tel it to none, but onely to those that have formerby tasted of that misery: for although among other effects of this poison, it is said that madness, or a distracted mind also followeth, yet I think in nature there can be no reason given of Platoes opinion, except he mean that the patient will never manifest his grief at all. And this howfoever also is consuted by this one story of Grevinue. There was (as he writeth) a certain Apothecary which did keep Vipers, and it happened one day as he was medling about them, that one of them caught him by his finger, and did bite him a little, fo as the prints of his teeth appeared as the points of needles. The Apothecary onely looked on it, and being busied, either forgot, or (as he said afterward) selt no pain for an hours space: but after the hour, first his singer smarted and began to burn, and afterward his arm and whole body fell to be fuddenly diftempered therewith, fo as necessity constrayning him, and opportunity offering it self, he sent for a Physician at hand, and by his good advise. (thorow Gods mercy) was recovered, but with great difficulty; for he suffered many of the former paffions and fymptoms before he was cured.

Therefore by this story, either Plato was in a wrong opinion, or elfe Grevinus telleth a fable, which Icannot grant, because he wrote of his own experience, known then to many in the world, who would quickly have contradicted it : or else if he had consented to the opinion of Plato, no doubt

but in the relation of that matter, he would have expressed also that circumstance.

Thus then we have, as briefly and plainly as we can, delivered the pains and torments which are cauled by the poison of Vipers; now therefore it followeth, that we also briefly declare the vertue of fuch Medicines, as we find to be applied by diligent and careful observations of many learned Physicians, against the venom of Vipers. First of all they write, that the general rule must be observed in the curing of the poison of Vipers, which is already declared against other Serpents: namely, that the force of their poison be kept from spreading, and that may be done either by the present extraction of the poison, or else by binding the wounded member hard, or else by cutting it off, if it be in finger, hand or foot.

Galen reporteth, that when he was in Alexandria, there came to the City a Countryman which had his finger bitten by a Viper, but before he came, he had bound his finger close to the palm of his hand, and then he shewed the same to a Physician, who immediatly cut off his finger, and so he was cured. And besides he telleth of another country-man, who reaping of Corne, by chance with his fickle did hurt a Viper, who returned and did raze all his finger with her poisonfull teeth. The man presently conceiving his own peril, cut off his own finger with the same sickle, before the poifon was spred too far, and so was cured without any other Medicine.

Sometime it hapneth that the bite is in such a part that it cannot be cut off, and then they apply a Hen cut in funder alive, and laid to as hot as can be, also one must first wash and anoint his mouth with oyl, and so suck out the poison. Likewise the place must be scarified, and party fed and dieted with old Butter, and bathed in milk or Seawater, and be kept waking, and made to walk up and down.

Nicander.

Paufanias.

In Vivera.

It were too long, and also needlesse, to expresse all the medicines which by naturall meanes are prepared against the poison of Vipers, whereof seeing no reasonable man will expect that at my hands. I will onely touch two or three cures by way of history, and for others, refer my Reader to Physitians, or to the Latine discourse of Garonus. In Norcheria, the country of that great and famous Gentilis who translated Avicen, there is a fountaine, into which if any man be put that is flung or bitten by a Serpent, he is thereof immediatly cured; which Amatus Luftanus approveth to be or ditten by a serpent, he is the state of the servery natural, because the continual cold water killeth the hot poison. The same Author writeth that when a little maid of the age of thirteen yeeres, was bitten in the heel by a Viper, the legge being first of all bound at the knee very hard then because the maid fell distract, first he caused a Surgeon to make two or three deeper holes then the Viper had made, that so the poison might be the more easily extracted, then he scarified the place, and drawed it with cupping-glasses, whereby was exhausted all the black blood, and then also the whole leg over, was scarified, and blood drawn out of it as long as it would run of it own accord. Then was a plaister made of Garlick, and the sharpest Onions rolled, which being mixed with Triacle, was laid to the bitten place. Also the maid drank three daies of Treacle in wine, and foure houres after a little broth made with Garlick,

The second day after the abatement of the pain, he gave her the juyce of Yew-leaves falling. which he commendeth as the most notable Antidote in this kind, and so made a second plaister which lay on three days more, and in the mean time the drank fasting every day that juyce of Yewleaves, whereby her trembling and diftracted estate was abated, but from the wounded place fill flowed matter, and it looked black. Then the four next daies, the faid matter was drawn out by a linnen cloth, wherein was Goates dung, powder of Lawrell, and Euphorbium in Wine, all mixed together, and afterward he made this ointment, which did perfectly cure her, Rec: of long Ari-Relochii two ounces, of Briony and Daffadil one ounce, of Galbanum and Myrrhe, of each one ounce. with a convenient quantity of oyle of Baies and Waxe. This applied to the bitten place in a linner cloth, and tentures twice a day, did perfectly recover her health within a month.

Ambroftus Paraus cured himselfe, with binding his finger hard that was bitten, and applying to it Triacle diffolved in Aqua vira, and drunk up in lint or bumbaft : and he adviseth in ftead of old Triacle, to take Mithridate. Gestier saith, that he saw a maid cured of the eating of Vipers slesh, by being constrained to drink Wine abundantly. Theophrastus and Asclepiades do write, that many are cured by the found of good Musick, as the like is already shewed, in the cure of the poison of the Phalangium : and no marvail, for Ilmenias the Theban affirmeth, that he knew many in Basia, that were cured of the Sciatica, by hearing of the musical sound of a good pipe.

Of the Medicines which may be made of the Viper.

He eating of Vipers is an admirable remedy against the Leprosie. And being prepared after 1 that fort as was mentioned immediatly before in the former Scation, they are ministred to the fick person sitting in the sun, yet his bead must be well covered or shadowed. Neither indeed to cat Vipers once alone, for twice is sufficient, but it must be done often, fith it is without danger, and moreover bringeth great commodity. And let the Vipers be new, and taken out of moist places, for those which are bred neer the Sea, are very thirfly and dry. The broth also of fod Vipers, is for fuch persons good supping meat.

The flesh of Vipers is in temperature apparantly hot and dry, and purgeth the whole body by fweat; here-upon many fore tormented with Leprofic, by eating and drinking them have been

Averroes faith, the flesh of Tyrus clenfeth Leprosie, because it driveth the matter thereof to the skin, and therefore they that drink it, fall first into the passion of Tyria, that is, the pilling of the skin, and after are cured of it.

Chuse the Vipers of the Mountain, especially being white, and cut off their heads and tailes at once very speedily, and then if the iffue of blood be plentiful, and they continue alive, and wallow to and fro a long time, these are good. After their beheading, let them be made clean and sod, and let the difeased party eat of them, and of their broth.

And by the drinking of wine wherein a Viper dieth or liveth, certain have been cured accidentally, or by an intent to kill them.

The Leaper must first drink the broth of Vipers decocted, in manner as afore-said, then let him eat the flesh, no otherwise then as mutton or sowles, which daily men dine with, bur fasting and in the morning this flesh must be eaten, half a Viper at once, and sometime a whole Viper, according to the firength of the party difeased. After the eating whereof, he must not eat or drink in the space of fix houres : but if he doe fweat, it is most expedient that in his sweat he look to himself very carefully. And the skin is wont to flea off from the Leaper, as it usually befalleth Serpents,

A min may easily see the slesh of Vipers to be hot and dry, when they are dressed as Bels. And that they purge the whole body thorow the skin, thou mayest learne even by those things, which my felf being a young man, had experience of in our Countrey of Afia, which thing feverally and in order I shall relate.

A certain man infected with the difeafe which men call Elephas, that is, Leprofie, for a time converfed still with his companions, till by his company and conversation, some of them were infected with the contagion of the difeafe, and he now became lothfome to fixell, and filthy to fight. Building therefore a cottage for him neer the Village, on the top of a bank, hard by a Fountain, there they place this man, and daily bring to him fo much meat as was sufficient to sustain life. But at the riing of the Dog-ftar, when by good hap, Reapers reaped not far from that place, very fragrant Wine was brought for them in an earthen veffel: he that brought it, fet it down neer the Reapers. and departed; but when the time was come that they should drink it, a young man taking up the and department of their manner having filled a boul, he might mingle the Wine with a competent measure of water, he poured the Wine into the bowl, and together with the Wine fell out a dead Viper.

wherefore the Reapers amazed thereat, and fearing left if they drank it, they should receive fome harm thereby, chose rather indeed to quench their thirst by drinking water : but when they departed thence, of humanity and in piety, gave the Wine to this Leper, supposing it to be better for him to die, then to live in that misery. Yet he when he had drunk it, in a wonderful manner was refored to his health; for all the fourf of his skin fell off as the shales of tender shelled creatures and that which remained, appeared very tender, as the skin of Crabs or Locusts, when their outward thell is taken away.

Another example by a chance not much unlike, hapned in Mysia, a Countrey of Asia, not far from our City. A certain Leper went to wash himself in Spring-water, hoping thereby to receive some benefit. He had a maid-fervant, a very fair young woman, importuned by divers futers: to her the fick man committed both certain other things pertaining to the house, and also the store-house, When they therefore were gone into the room, to which a filthy place and full of Vipers adjoyned, by chance one of them fell into a Veffel of Wine there negligently left, and was drowned. The Maid esteeming that a benefit which Fortune offered, filled that Wine to her Master, and he drank it, and thereby in like fort as he that lived in the Cottage, was cured.

These are two examples of experiment by casual occasion. Moreover, I will adde also a third, which proceeded from our imitation. When one was fick of this disease, in minde more then the common fort Philosophical, and despising death, took it exceeding grievously, and said it were better once to fuffer death, then to live so miserable a life : and drinking Wine so mingled with poyson, he became a Leper; and afterward we cured his Leprosie by our accustomed medicines.

Also a fourth man took Vipers alive, but that man had only the beginning of this disease; therefore our care and industry was very speedily to restore him to health : wherefore having let him bloud, and by a medicine taken away melancholy, we bad him use the Vipers he had taken, being prepared in a pot after the manner of Eels. And he was thus cured, the infection evaporating through the skin.

Laftly alfo, a certain other man very rich, not our Country-man, but of the middle of Thracia, admonished by a dream, came to Pergamus, where God commanded him by a dream, that he should daily drink the medicine which was made of Vipers, and outwardly he should anoint his body, and not many days after, his disease became the Leprosie: And again also, this infirmity was afterward cured by the medicines which God commanded.

Matthew Grady fed Chickins and Capons with the broth and flesh of Vipers mingled with bread, Galen. till they cast their feathers, purposing by them to cure the Leprosie.

A certain Noble-woman in this City, infected with this malady (the Leprofie) after divers in- Hellidem. fortunate attempts of many, came to my hands, in whose cure, when generous medicines availed nothing, at last, with consent of her husband, I purposed to try her with Vipers slesh: whereupon a female Viper being cleanfed and prepared after that fort as Galen prescribeth in his Book De Theriaca, mingling the flesh of the Viper with Galangal, Saffron, &c. I sod her very well : then I took a Chicken, which I commanded well to be fod in the juyce and broth of the Viper. And lest the should take any harm thereby, I first ministred unto her Mithridate, then the Chicken with the broth, by eating whereof she said she felt herself better : Which when I faw, I took another male Viper, whom I fod alone without adding any other thing, and the broth thereof I ministred to her three days, whereupon she began to sweat extreamly, the sweat I restrained by syrup of Violets and pure water. After six days, scales fell from her, and she was healed. Moreover, the foon after conceived a man-childe having been barren before the space of for-

Antonius Musa a Physician, when he met with an incurable Ulcer, he gave his patients Vipers to Pliny. eat, and cured them with marvailous celerity. When the servants of Craterus the Physician fell into a strange and unusual disease, that his stesh fell from his bones, and that he had proved many medicines which profited him nothing, he was healed by eating a Viper dreffed as a fish.

Vipers fiesh if it be fod and eaten, cleareth the eyes, helpeth the defects of the finews, and repres- Porphyrius. feth fwellings.

They say they that eat Vipers become lousie, which is not so, though Galen affirm it. Some adde Dioscorides. them to live long who eat that meat, to wit, Vipers. Ifogonis affirmeth the Cirni, a kinde of Indians, to live an hundred and forty years. Also he thinketh the Ethiopians, and Seres, and the Inhabitants of Mount Ather to be long lived, because they eat Vipers flesh.

The Southans cleave the head of the Viper betwirt the ears, to take out a flone, which they fay Pliny. the devoureth when the is affrighted.

The heads of Vipers burnt in a pot to ashes, and after beaten together with the groffest decoction of bitter Lupines, & spred as an ointment on the temples of the head flayeth the continual rheume of 2223

Faventin.

Some extend and dry whole Vipers, and after beat them to powder, and minister them in drink against the Gowt. Others about the rising of the Dog-star, cut off the head and tail of Vipers. and burn the middle, then they give those ashes to be drunk 21. days, so much at a time as may be taken up with three fingers, and so cure the swelling in the neck. Joynts pained with the Gowt, are profitably anointed with Oyl wherein a Viper hath been fodden, for this cureth per-

The making of the Oyl of Vipers, is described in these words; Take three or four Vipers, cut of their extream parts, the head and the tail, in length four fingers, divide the rest into four gobbets and put them in a pot open above and below, which pot must be put into another greater pot; then the mouth of them muit be well shut with clay, that they breath not forth; then put them into a Caldron full of feething water, and there let them continue boiling two hours in those pots : then will distil a liquor from the Vipers, which were in the pot open above and below, with that Oily liquor anoint the members of the party molested with the Palsie, for by a secret property it cureth the grief of that disease.

Of Triacle and Trochuks of Vipers.

Galen.

Theriace or Triacle, not only because it cureth the venomous biting of Serpents, but also because the Serpents themselves are usually mingled in the making thereof, fitly is so named of both significations. Here also we will insert something concerning Trochuks of Vipers, which are mingled in the making of Triacle.

Triacle is very ancient, and hath always very carefully, and not without ambition, been refined by the Physitians, till Andromochus Nero his Physitian, added the flesh of Vipers, as the full accomplishment of this drug. The flesh of Vipers alone is mingled in Triacle, and not the flesh of other Serpents, because all the rest have something malignant more then Vipers. Vipers are thought to have lesse

poyfon in them then other Serpents. Vipers for Triacle must not be taken at any time, but chiefly in the beginning of the Spring, when having left their dens, they come forth into the Snn-shine, and as yet have not poylon much

Take female Vipers, for we must take heed how we take male Vipers for the confection of Antidotes. For Trochuks all Vipers are not convenient, but those which be yellow, and of the yellow, the females only.

Vipers great with young you must refuse, for being pregnant, they are more exasperate then

themselves at other times.

Of Vipers be made Trochifces, which of the Grecians are called Theriaci, four fingers being cut off at either end, and the inwards taken out, and the pale matter cleaving to the back-bone the reft of the body must be boiled in a dish in water, with the herb Dill, the back-bone must be taken out, and fine flowre must be added. Thus these Trochuks being made, they must be dryed in the shade, apart from the Sun-beams, and being so prepared, they be of very great use for many medicines.

The use of Triacle is profitable for many things, for not only by his own nature it availeth against the biting of venomous creatures and poylons, but also it is found by experience, to help many other great infirmities. For it easeth the Gowt and pain in the joynts, it dryeth fluxes, it very much profiteth men molested with the Dropsie, leprous and melancholick persons, those that have Quartane Agues, or the Jaundise, those that have a weak voice, or that spet bloud : those that are troubled with aking reins, with Dysentery, with the stone, with short breath, with passion of the liver or milt, with choler, with heart-ach, with the Falling-ficknesse. It driveth all kinde of Worms out of the bowels It is the most soveraign remedy of the Plague.

Even to them that are in health the often use of it is wholesome, for it promiseth long life, and firm health, it confumeth excrements, it ftrengtheneth natural actions, it quickeneth the wit, and tharpeneth all the fenfes; it preferveth the body from poyfon and other offences, and maketh it fearse subject to danger by such casualties; it begetteth good bloud, it corrupteth the the air, waters; neither alone doth it deliver from instant diseases, but also preserveth from those that be imminent.

Of EARTH-WOR MS.

Ethough there be many and fundry forts of Worms which do contain in them fome poylonous Doctor Rese. A quality, yet for all that, at this time my purpose is to discourse especially of Earth-worms, bams discourse whereof some are bred only in the earth, and others among plants, and in the bodies of living of Worms. creatures. Worms of the earth are termed by Plaute and Columella Lumbrici, peradventure as being derived a Lubricitate. They are called also Terra Intestina of the Latines, as well because they take their first beginning and breeding in the very bowels and inward parts of the Barth, as because being preffed and squeeled betwixt the fingers or otherwise, they do void forth excrements after the fashion of living beafts that have intrails in them. The Greeks call them Gegentera; Hefychius calleth them Embulous: Brunfelfius Otho in his Phyfick Lexicon writeth, that they are usually called in the Cilician tongue Gaphagas, fetching the derivation of the word parà To gaian phágein, for they feed upon earth. Of the Englishmen they are called Meds, and Earth-worms; of the French, Vers de Terra; of the Germans, Eert wurm, and Erdwurmem, Melet, Ode Regenwurm; of the Belgians, Pier-wuorm, or Rengenwuorm; of the Italians, Lumbrichi; of the Spaniards, Lumbrizes; of the Polonians, Glissi; of the Hungarians, Galilza: of the Arabians they are called Charatin. Manardus in his second Book and 40. Epistle writerh that in times past they were called Onisculi, and Nisculi.

There are found especially two forts of Earth-worms, which are either greater or leffer. The greater Earth-worms are somewhat long almost like in proportion and shape to those round Worms which do breed in mens bodies. They are half a foot long at least, and being stretched out in length they are found to be a foot long, they are of a whitish colour, and sometimes though seldom of a bloudy hue: and for the most part they are all adorned with a chain about their necks, or rather they feem to wear a certain collar, wherein there is a little bloud contained, and they lack eyes and eye-fight, as all forts of Worms do.

They breed of the flime of the earth, taking their first being from putresaction, and of the fat moisture of the same earth they are again fed and nourished, and into earth at last are resolved. When there falleth any showre of rain, then this kinde of Worm creepeth suddenly out of the earth, whereupon old Euclio in Plantus being very careful of his pot of Gold, speaketh aptly to his Drudge Strobilus in these words:

Foras, foras Lumbrice, qui sub terra erepsisti modo. Qui modo nusquam camparebas, nunc autem cum compares, peris. Which may be Englished thus : Away, away thou Worm, late from the earth crept out, Safe thou wast unseen, but feen, life fails I doubt.

In Aulularia.

Here Euclio very properly termeth his Bondman Strobilus, a Worm because not being espyed of his Master before he suddenly came sneaking out from behinde an Altar where he was hid, much like a Worm, that in moift weather iffueth out of the ground. Those little heaps which are cast up and lie shining and wrinckled before the mouth or edges of their holes, I take them to be their miery excrements: for I cold never as yet finde other excrementitious substance, drossy matter, or other feculency, but only bare earth in them, whose alimentary juyce and moisture being clean exhausted, they cast out the remainder, as an unprofitable burthen, nothing fit for nouriffment. At the entrance of their doors, which yet fleadeth them to some commodious use, for stopping and damming up their holes that the rain cannot so easily soke in, they are by these means safely desended from many anoyances and dangers, that otherwise might light upon

Their delight is to couple together, especially in a rainy night, cleaving together untill the morning: and in the same they are not folded round about one another like unto Serpents, but are fraightly closed together fide-wife, and thus do they remain flicking close the one to the other. They fend forth a certain froathy slime or jelly when that they joyn together. They do ever keep the middle part of their body within the earth, I mean their hinder-parts; yea even in their mutual joyning together, neither are they at any time so fast glewed and closed, but with the half firring and motion of the ground that can be imagined, they are straight-ways severed, withdrawing themselves speedily into their lurking holes. In rainy weather they are whiter a great deal then at other times, unleffe it be when they couple together, for then they appear very red. I my felf about the midft of April, did once open a thick female Worm, and within the flesh I found a certain receptacle ringed round about, and filling up the whole cavity of the body, having a thin membrane or feat enclosing it, and in this aforesaid store-house the earth which she had sed on, and wherewith the was fultained, was held and contained. Her egges were found to be in a fafe place above the receptacle, next to the mouth, there were many of them on a heap together, being all of a whitish colour.

The leffer Earth-worms for perspicuities sake, we with Georgiu Agricola will name Ascarider : and these are often found in great numbers in Dung-hills, Mixens, and under heaps of stones. Of this fort some are red, (which we Englishmen call Dugs) and these be they that Anglers and Fishers

Avicen.

Galen. Actius. do so much desire, for Fishes will greedily devour them, and for that end they with them do bait their

There be some others of these lesser Earth-worms that are somewhat of a blew colour, other-There be some others of these tail: whereupon they have purchased the name of Yellome again are yellow only about the necks, withall very fat. Some others there be that low tails. Some again are ringen about the commonly be more lank and flender of body then the have neither chains nor rings, and these commonly be more lank and flender of body then the have neitner chains nor rings, and there will be the males. These Worms do specially breed in Autumn, or at tormer, and there I judge to be the there is but little moisture in the earth, and this is Arifolles opinion. Both kindes do live long in the water, but yet at length for want of fustenance there they mon. Both kindes do live long in the with a kinde of reaching and thrusting forwards, for we cannot die. They move from place to place with a kinde of reaching and thrusting forwards, for we cannot die. I ney move from place to place with the die of the properly fay that they do either rowl or tumble. Olympio in Plantu would go about to make a simple property lay that they do that Worms did eat nothing but very earth, because he used these words to Ghalinus;

Post autem nis nife ruri tu ervum comederie : (for thus Lambine readeth) Aut quast Lumbricus terram. In English thus; And afterward thou nought but Tares shalt eat, Or elfe like Worms , the earth shall be thy meat.

But by earth here in this place, he understandeth not pure earth; and such as is without any other mixture, but rather the fat, juyce, and moisture of the same. And this is the reason, that Earth-worms are not to be found in all foils alike, as in barren, fandy, ftony, flard, and bare grounds, but only in fat, gravelly, moift, clammy and fertile. And for this respect England hath many Worms, because both Countrey and soil are very moist: and this moisture whereon they seed must not be falt, fowre, tart, or bitter, but fweet and toothfome: and therefore it is, that Lucretine in his fecond Book writeth, that Worms are bred most when it showreth, as in rainy seasons and moist weather.

> Quatenus in pullos animaleis vertier ova Cerminus aliinum, vermefq; effervere terram Intempestivos cum putror capit ob imbres. In English thus; Even as in time of rain, we fee Birds Egges their young forth hatchs And Worms in heat of gendering be When they clouds rot do catch.

And to this opinion of Lucretius, Nicander feemeth to lean, when he affirmeth, that these In Theriaca. Worms are nourished altogether of the earth that is moifined with long rain, or with some smoaking shower: for making a difference between the Serpent Seytale, and the Amphibens, he thus writeth;

> Steileies pachetos, tes elminthos pelei ogros He cai entera ges oia trephei ombrimos aia. Id eft. Manubrii ligonis latitudo, longitudo verò et que Lumbrico, Aut terra intestinie . qua imbribu irrigata terra alit. That is to fay ; As broad as haft of Spade, his length like little Worm. And fed with dreary earth, moist by clouds and rainy form.

The greater fort of Earth-worms live in the bowels of the earth, and most of all in an open free air, and where there is some repair and confluence of people. Every morning they withdraw themselves into their secret holes and corners within the ground, fencing the entrance of them with their excrements they have voided forth, in a fair and Sunshine weather: but in rainy weather they use to stop the mouths of their holes with some stalk or leaves of herbs or trees, being drawn a little inwardly into the earth. They feed upon the roots of those Plants which have any fweet juyce or moisture in them; and therefore one may many times finde them amongst the roots of common Meddow-graffe: and they do live for the most part by the fat moisture of the earth, yet will they also greedily devour crums of white Bread unleavened, as I have often feen. In the Spring time, they first appear to come forth from the bowels of the earth, and all the Winter they lie hid in the ground, but yet if it be a very tharp and pinching cold Winter, and a dry Summer follow, for lack of moisture they do almost all die.

Belides, if you dig into the earth, or make a great motion, trampling, or hard treading upon ed; as for example, the juyce of Wall-nut-trees, the water wherein Hemp either feeds or leave Larth-worms.

are foaked, or been laid to rot in common lye, and the like, they will iffue out of the earth foeedily. and by this means Fisher-men and Anglers do take them.

In like manner, they cannot endure Salt, or aromatical things, nor by their good will come neer them, for but touching any of these they will draw themselves on a heap, and so die. Worms are found to be very venomous in the Kingdom of Mogor, and the Inhabitants there do stand in fo great fear of them, that they be destroyed and slain by them when they travel any journey; and thereforethere they use ordinarily to carry Beesoms with them to sweep the plain ways for fear of further hurt. Georgius Agricola faith, that the little Worms called Afcarides, are not all of one colour: for some are white, some yellow (as I remembred a little before) and others again are very black : and many of these in tilling the earth are cast up by the plough, and many found in divers places all on a heap together. These be they that destroy corn-fields, for by sharing or biting the roots the fruit dyeth.

Some say, that those Worms do most mischief to corn-grounds, which in some places of Italy the neople term Zaccarole, and these are thick, almost a finger long, being naturally of a very cold conflittion of body; and therefore they never use to come forth of the earth, but when the weather is passing hot, for then will they come forth, even to the surface of the ground, as it is notably set down, by the famous Poet Homer :

Ovi,amo.l.3.

– à quo ceu fonte perenni, Vatum Pieriis labra rigantur aquis. In English thus: By whom, as by an everlasting filling Spring, With Muses liquor, Poets lips are bath'd to fing.

Homer very fitly compareth Harpalion when he fell down dead amongst his companions, to a filly Worm, when as feeking to escape by flight out of the battel, he was wounded to death by Meriones, shooting an arrow or steel dart into his hanch or hip, his verses be these;

> Meriones d'apiontos tei chalkere oiston, Kai rebale gloucon kata dexion autar oiftos, Antikron kata kuftin up' ofteon exeperesen: Exomenos de cat' authi philon en chersin etairon, Thumon apopneion, ofte fcolex epi gaia Keito taobeis cod' aima melan ree, deue de gaian. Meriones autem in abeuntem misit eream sagittam, Et vulneravit conam ad dentram, ac fagitta E regione per vestcam sub os penetravit: Residens autem illic obarorum inter manus sociorum Animam efflans, tanquam vermis super terram Jacebat extensus: sanguisq; effluebat, tingebat autem terram.

That is to say;
But as he went away, behold Meriones With brazendart, did his right hip-bone wound, Which neer the bladder did the bone through pierce : In friends deer bands, he died upon the ground. So Aretobt upon the earth as Worm be lyed, Black bloud out flowing, the same bedyed.

Mark well the flendernesse of this comparison, whereby he would give us to understand the base estate, and faint heart of Harpalion. For in other places having to write of noble, valiant, and magnanimous persons, when they were ready to give up the ghost, he useth the words Sphadazein, Bruthein, and the like to these, secretly infinuating to us, that they sell not down dead like impotent Cowards, or timorous abjects, but that they raged like Lions, with grinding and gnathing their teeth together, that they were blafted, benummed, or fuddenly deprived of all their lives and senses, &cc. But herethis pusillanimous and sordidous minded man Harpalion, seemed to be difgraced by his resembling to a poor Worm, being peradventure a man of so small estimation, and vile condition, as that no greater comparison seemed to fit him. It seemeth he was a man but of a faint courage, and very weak withall, because firiking and thrusting with his Spear or Javellin at the Shield or Target of Airides, he was not able to ftrike it through. But although this amous Poet doth to much feem to extenuate and debase a weak Worm : yet others have left win their writings such commendations of their singular use and necessity, for the recovery of man health (then which no earthly thing is more pretious) and have fo nobilitated the worth of these poor contemptible Creatures, as I think, nature as yet hath scarse given any other simple Medicine, or experience found out by tract of time, nor knowledge of plants by long study hath revealed; nor Paracels by the Distribucions of his Limbeck thath made known to the world, any fetret endued with fo many vertues and excellent properties against fo many diseases : and for proof hereof, it shall not be beside the purpose to examine and describe the rarest and most probable that are recorded amongst the learned. BarthEarth-worms do mollifie, conglutinate, appeale pain, and by their terrefirial, and withall water ish humidity they do contemper any affected part, orderly and measurably moderating any excellent the state of the s ish humidity they do contemper any excesse whatsoever. The powder of Worms is thus prepared: They use to take the greatest Earth-worm whatsoever. The powder of Worms is Mode, suffering them there to remain for whatloever. The powder of worlds is the ferring them there to remain for a certain time, that can be found, and to wrap them in Mosse, fuffering them there to remain for a certain time, that can be found, and to wrap them in whom from that clammy and filthy flimyneffe, which outthereby the better to purge and tienne this is done, they prefle hard the hinder-part of their bo. wardly cleaveth to their bodies. When all this is done, they prefle hard the hinder-part of their bo. wardly cleaveth to their poules. When an entry their excrements, that no impurity fo neer as is possible dies neer to the tail, squeesing out thereby their excrements, that no impurity so neer as is possible

The History of Serpents.

may be recained in them. ay be retained in them.
Thirdly, they use to put them into a pot, or some sit vessel with some white Wine, and a little salt, and fraining them gently between the fingers, they first of all cast away that Wine, and then de and itraining them gently between the ingers and after the washing of the Worms, they must also take away some they pour more Wine to them, and after the washing of the Worms, they must also take away some they pour more Wine to them. of the Wine, for it must not all be poured away (as some would have it) and this must so often be of the Wine, for it must not all be possing clear without any filth or droffinesse, for by this done and renewed until the wine sevil quality is clear loft and spent. Being thus prepared, they way their slimy jelly, and glutinous evil quality is clear loft and spent. Being thus prepared, they way their many jenty, and glutinous evil quantity of long till they may be brought to powder, which are to be dryed by little and little in an Oven, fo long till they may be brought to powder, which being beaten and fearfed, it is to be kept in a Glasse vessel far from the fire by it self. A dram of this powder being commixed with the juyce of Marigolds, cureth the Epilepsie, with some sweet Wine as Museadel, Bastard, or the Metheglin of the Welchmen. It helpeth the Dropsie. With white Wine as Manjoaurs, Battala, of the with new Wine, or Hydromel the Stone; Ulcers of the Reins and Blad. and myrrie, the January, which also the belly, helpeth barrennesse, and expelleth the Secondine, it asswageth the pain of the hanch or hip; by some the Sciatica; it openeth obstructions of the Liver driveth away Tertian Agues, and expelleth all Worms that are bred in the Guts, being given and taken with the decoction or distilled Water of Germander, Worm-wood, Southern-wood, Garlick, Scordum, Centory, and fuch like.

The decoction of Worms made with the juyce of Knot-graffe, or Comfery, Salomons Seal, or Sarasius compound, cureth the disease tearmed by Physitians Diabetes, when one cannot hold his w ater, but that it runneth from him without flay, or as fast as he drinketh. A Glyster likewisemade of the decoction of Earth-worms, and also taken accordingly, doth marvellously asswage and appeale the pain of the Hemorrhoids. There be some that give the decoction of Earth-worms to those perfons that have any congealed or clotted bloud in their bodies, and that with happy successe. The vertue of Earth-worms is exceedingly fet forth, both by the Grecians and Arabians, to encrease Milkin

Hieronymu Mercurialis a learned Physician of Italy, adviseth Nurses to use this confection following in case they want milk, always provided that there be not a Fever joyned withall. Take of the Kernels of the fruit of the Pine-tree, sweet Almonds, of each alike, one ounce, seeds of Fennel, Parsley, and Rapes, of either alike one dram, of the powder of Earth-worms washed in Wine, two drams; with Sugar so much as is sufficient, to be given the quantity of a dram or two in the morning, and after it drink fome small Wine, or Capon-broth boyled with Rape-seeds and Leeks. Against the Tooth-ach the same powder of Earth-worms is proved singular, being decocted in Oyl, and dropped a little at once into the ear, on the same side the pain is, as Pliny witnesseth, or a little of it put into the contrary ear, will perform the same effect, as Diescorides teftifieth. And thus far of Earth-worms taken into the body, and of their manifold vertues, according to the evidence and testimony of Dioscorides, Galen, Actius, Paulus, Egineta, Myrepsus, Pliny, and daily experience which goeth beyond the precepts of all skilful Masters; for this is the Schoolmistris of all Ans, as Manilius in his fecond Book hath written :

> Per varios usus artem experientia fecit, Exemplo monstrante viam. In English thus; Experience teacheth art by use of things, When as example plainest way forth brings.

Being also beaten to powder, and outwardly applyed, they do close and solder up wounds, and conglutinate finews that are cut, and confolidating them again in the space of seven days, and to perform this cure the better, Democritim adviseth to keep them in Honey. The alles of Barthworms duly prepared, cleanfeth Sordious, flinking and rotten Ulcers, confuming and washing away their hard lips, or callous edges, if it be tempered with Tar and Simblian Honey, as Play atfirmeth. Diosorides saith, that the Honey of Sicilia was taken for that of Simblia in his time. Their ashes likewise draweth our Darts or Arrows shot into the body, or any other matter that sticketh in the flesh, if they be tempered with Oil of Roses, and so applyed to the place affected. The powder also cureth Kibes in the heels, and Chilblanes on the hands, as Marches testifieth, for hurts that happen to the finews when they are cut in pieces, Quintum Serenus hath thee verfes ;

> Profuerit terre Lumbricos indere tritos, Queis vetme & rancens sociari anungia debet.

It is good (faith he) to apply to finews that are diffected. The powder of Earth-worms mixed and wrought up with old, rammifh, and unfavory Barrows greafe, to be put into the grief. Mar-Mu Empirion, Besides the powder of Barth-worms and Axunger, addeth further. Grounswell. and the tender tops of the Box-tree with Olibanum : all these being made up and tempered together to make an Emplaster, he counselleth to be applyed to sinews that are laid open, cut afunder. or that have received any puncture, or fuffer any pain or aking what foever. Pliny faith, that there cannot be a better medicine found out for broken bones, then Eirth-worms and field Mice dryed and pulverifed, and so mixed together with Oyl of Roses, to be laid in the form of an emplather upon the part fractured. Yea; to affwage and appeale pain, both in the joynts and in the finews of Horses, there hath not been found out a more notable Medicine, as we may well perceive by the writings both of Ruffim, Absyrtm, and Didymm : whereupon Cardan hath observed that all pains what foever may be mitigated by their apt using. Carolin Cluston faith, that the Indians do make an excellent unguent of Earth-worms against the disease called Eryspelas, being a swelling fill of heat and rednesse with pain round about, commonly called S. Anthonies fire : And thus it is

They first take Barth-worms alive, feeding them either with the leaves of Maza, or else with fine Meal, until by this means they grow fat, afterwards boiling them in an earthen veffel, fremembring ever to fcum the same) they do ftrain them, boyling them yet again, to the consistence afmost of an emplaister, which if it be rightly prepared is of a yellow colour. And this Medicine may well be used for any burning or scalding. My purpose is not to vouch all those authorities I might, concerning the admirable Nature and vertue of Earth-worms: for fo I think I might alledge fix hundred more, which is not meet to be inferted in this place. I will therefore now paffe to their qualities and medicinal uses for irrational creatures.

Pelaronius much commendeth Earth-worms as an excellent medicine for the Bots or Worms that arein Horses, and in the bodies of Oxen and Kine, affirming that the best way is to put them alive into their Nofthrils, although without question it were far better to conveigh them into their maws by the means of some horn. Tardinus adviseth to give the powder of Eirth-worms with some hot flesh, to Hawks when they cannot exonerate nature (or how Faulkeners tearm it, I know not) For that (faith he) will loofen their bellies. Moles do also feed full favorly upon them, and if they fall adigging, it is strange to see with what sudden hast and speed then poor Worms will issue out of the ground. In like fort Hogs and Swine (as Varro writeth) by their turning up the mud, and rooting in the earth with their fnowts, do by this means dig up the Worms, that they may eat

Albertus Magnus faith, that Toads do feed upon Worms. Bellonius faith, that Lizards and Tarentinus, that the Sea-fish called Gryff, or Grample, doth greedily devour them, and finally experience it self witnesseth, that Frogs, Eels, Gudgeons, Carps, Breams, Roches, and Trowts, do satisfie their hungry guts by feeding upon them. Ariftotle in his eight Book De Nat. Animal. Cap. 2. describeth a certain Bird that liveth in the waters, which Gaza interpreteth Capella, though the Philosopher calleth it Aim, and some have called it Udbellus, that liveth for the most part upon Worms: yea, Thrushes, Robin-red-breasts, Mun-murderers, and Bramblings, Hens, Chassinches, Gnat-snappers, Bull-finches, and all forts of Crows will feed upon them; and therefore it is that there be more Crows in England, then in any other Countrey in the world, respecting the greatnesse, because here the foil being moist and fat, there is abundance of Earth-worms serving for their food, as Polyderus Virgilius in his first Book of the History of England, (which he dedicated to King Henry the eight) hath excellently delivered.

The people of India, if we will credit Minardus, do make of these Worms divers juncats, as we do Tarts, Marchpanes, Wafers, and Cheefe cakes, to eat instead of other dainties. And the Inhabitants of Well-India do devourthem raw, as France Lopez testifieth. The people of Europe in no place that ever I heard or read of, can endure them to be fet on their Tables, but for medicinal uses only they desire them. Plantus useth in stead of a proverb this that followeth;

Nunc ab transenna bic turdus Lumbricum petit.

It is an allegory taken and borrowed from a gin or fnare wherewith Birds are taken: by which Chrisa'us the bond-man bringing certain Letters to Nicobelus an old man, fignifieth and giveth warning, that the weak old man was by the reading of the letter no otherwise ensured, intangled, and deceived, then some Birds are taken by subtile and crasty sleights. For Transenna is nothing but a deceitful cord stretched out to take Birds, especially Thrushes or Mavisses withall, and Worms is their proper food, which while they endevour to entrap, they themselves are deceived and taken. Surely I should not think that those Fishers and Anglers be very wife, who to take Worms, use to pour lye or water into the earth wherein Hemp, Southern-wood, Centory, Wormwood, or Vervin have been long foaked, or any other strange moisture, causing them by this mean to iffue forth out of the earth, for the Earth-worms by this kinde of dealing being made more bitter, unfavoury, and unpleasant, no fishes will once touch or tast them, but rather seek to avoid them. But contrarywise, if they will let them lie a whole day in Wheat-meal, putting a little Honey to it, and then bait their hooks with them, they will be fo sweet, pleasant, and delectable, as that the unwary Fish will sooner bite at it, then at Ambrofia, the very meat of the Gods.

In Bacchide.

there

Earth-worms do also much good to men, ferving them to great use in that they do prognofipartn-worms and another by their fodain breaking or iffuing forth of the ground; and if cate and foreten rainy weather by it is a great fignit will be calm and fair weather the next none appear above ground over-night, it is a great fignit will be calm and fair weather the next none appear above ground overlying the heart observed this as a general rule, that if day. The ancient people of the world have ever observed this as a general rule, that if day. The ancient people of the world, and in haste by heaps, as if they had bored it through Worms pierce through the earth violently, and in haste by heaps, as if they had bored it through Worms pierce through the earth violently, and infallible token of Rain shortly after with some little Auger or Piercer, they took it for an infallible token of Rain shortly after with some little Auger or Piercer, they took it for an infallible token of Rain shortly after with some little and made moist, and shortly after the sound of the so with some little Auger or piercer, they took and, distained, made moist, and moved with an to fall. For the Earth being as it were imbrued, distained, made moist, and moved with an to fall. For the Earth being as it were thindred, and partly also a vaporous air, it yeeldeth an imperceptible motion, partly the South winde, and partly also a vaporous air, it yeeldeth an eatie passage for round Worms to winde out of the inward places of the Earth, to give unto eatie pattage for round worth to minister fore of fat juyces, or fattish jelly, wherewich they are altogether delighted.

ther delignted.

Somethere be found, that will fashion and frame Iron after such a manner, as that they will Some there be round, that will take of any feel, after this order following. They take of Earth-worms bring it to the hardnesse of any feel, after they are bruised together. bring it to the narunelle of any acces, after they are bruifed together, the water is put into two parts, or reading roots one parts into parts, or reading a Limbeck to be diffilled, or effectake of the diffilled water of Worms I. iij. of the juyce of Raddiff a Limbeck to be untilted, or Iron being often quenched in this water, will grow exceeding hard.

Another. Take of Earth-worms l. ij. distil them in a Limbeck with an easte and gentle fire, and Another, Take of Goats bloud fo much as you please, temper your Iron in this distilled water. Another, Take of Goats bloud so much as you please, temper your from in this until at you plane, adding to it a little common falt, then bury them in the earth in a pot well glafed and luted for adding to it a little common falt, then bury them in the earth in a pot well glafed and luted for adding to it a itere common late, then diftil after this the fame bloud in Balneo; and to this diffilled liquor, add thirty days together. Then diftil after this the fame bloud in Balneo; and to this diffilled liquor, add fo much of the diffilled water of Earth-worms. Another. Take of Earth-worms, of the roots of Apple-trees, of Rapes of each a like-much, diffil them apart by by themselves, and in equal poror Appie-tiees, or taspers, and afterwards equally mixed, quench your Iron init, as is faid be tions of this water fo diffilled, and afterwards equally mixed, quench your Iron init, as is faid be

It shall not be impertinent to our matter we handle, to add a word or two concerning those worms that are found and do breed in the fnow, which Theophanes in Strabe calleth Oips but because it may feem very strange and incredible, to think that any worms breed and live only in the Snow, you shall hear what the Ancients have committed to writing, and especially Strabo his opinion concerning this point. It is (faith he) received amongst the greater number of men, that in the from there are certain clots or hard lumps that are very hollow, which waxing hard and thick, do contain the best water as it were in a certain coat; and that in this case or purse there do breed worms. Theophan s calleth them Oripas, and Apollinides, Vermes.

Arifforle faith, that living creatures will breed also even in those things that are not subject to putrefaction; as for example, in the fire and fnow, which of all things in the world, one would take never to be apt to putrefie, and yet in old Snow Worms will be bred. Old Snow that hath lyen long, will look somewhat dun, or of a dullish white colour, and therefore the Snow-worms are of the same hiew, and likewife rough and hairy. But those Snow-worms which are found to breed when the air is somewhat warm, are great; and white in colour, and all these Snow-worms will hardly fir, or move from place to place. And Pliny is of the fame judgement, and the Author of that Book which

Lib 11. 6.35. is intituled De Plantis, falfely fathered upon Aristotle. Yet some there be that denying all these authorities, and rejecting whatsoever can be objected for confirmation thereof to the contrary, do foutly maintain by divers reasons, that creature cannot breed in the Snow : because that in Snow there is no heat, and where no quickning heatis, there can be no production of any living thing. Again, Ariffolle writeth that nothing will come of Ice, because it is (as he saith) most cold: and hereupon they infer that in all reason, nothing likewife can take his beginning from Snow; neither is it credible, that husbandmen would fo often wish for Snow in Winter to destroy and confume Worms, and other little Vermine, that else would prove so hurtful to their corn and other fruits of the earth. And if any Wormsbefound in the Snow, it followeth not straightways that therein they first receive their beginning, but rather that they first come out of the earth, and are afterwards feen to be wrapped up, and lie on heaps in the Snow.

But by their leaves these reasons are very weak, and may readily be answered thus; that whereas they maintain that nothing can breed in the Snow, because it is void of any heat at all, hereinthey build upon a falle ground. For if we will adhibit credit to Averboes, there is nothing compounded and made of the three Blements, that is absolutely without heat. And Arifiale in his fift Book De Generatione Animalium, telleth us precisely , that there is no moisture without heat. His words are Ouden hugron onen thermou. Now Snow is a compact, and fast congealed substance, and fomewhat moift, for although it proceedeth by congelation, which is nothing elfe but a kinde of exficcation, yet notwithstanding, the matter whereof it first cometh is a vapour, whose nature is moift, and with little ado may be turned into water.

I must needs say that congelation is a kinde of exficcation, but yet not simply: for exficts. tion is, when as humidity goeth away, it putteth forth any matter, but in Snow there is no humidity that is drawn out, but it is rather wrapped in and inclosed more ftrongly, and sit were bounded round. Furthermore Ariffotle in his first Book of his Meteors faith, that Snow is Name congelata, a clowd congelated or thicked together, and that in Snow there is much heat. And in fift Book De Generatione Animalium, he further addeth, that the whitenesse of the Snow is cauch by the air, that the air is hot and moift, and the Snow is white; whereupon we conclude that Snow is not to gold, as some would bear us in hand. I well hold that nothing will take his Original from Ites, in regard of his excellive coldnesse, but yet from is nothing high so cold as thee. on then allette hinderance and let is found to exceed of cold, which is nothing to effectual or forcible as in Ite, and the cold being proved to be far leffer, there can nothing be alleadged to the contrary, but that it may putrefie in ... of 2 11 1.1

Now in that Snow is such an enemy to Worms, and many other small creatures, as that for the most part it destroyers them, yet it followeth not, that the reason of Aristotle is quite overthrown; because (as we daily see) that those creatures which live in the air, will for the most partibe suffocare and die in the water; and contrariwise, those that live in the water, cannot endure the aid . Yet hereupon it followeth not, that if they be choked in the water, that none at all will live in the water, and the fame reason is to be alleadged concerning the air. Therefore ir is no marvail if those Worms that first breed in the earth, and live in the earth, be killed by the Snow: yet it necessarily followeth not, that no living creature can take his first being either from orinthe frow. But if it can, as Ariftotle witnesseth, it is so far unlikely that the same Snow should bethe deltroyer of that it first was bred of, as I think rather it cannot live separately, but of necesfits in the same Snow; no otherwise then fishes can live without water, from which they first spring and had their beginning.

And to this opinion leaneth. Theophrasiu, in his first Book De Causis Plantarum, whose words be thele. Apania gar pha n tai ta zoa, kai ta phuta kai diamenonta, kai genomena, en tou oiksiois topois: For all creatures (faith he) what foever feem, both plants to remain, and to be generated and bred in their own due and proper places. And after this he addeth and urgeth a little further, Aparthe men hapo touton; from his own home and special particular place of abode, nothing can suffer, suffain harm, or be corrupted. And in his fift Book De cauf. Plan. he fetteth it down more perspicuously, how that Worms which are bred in some special trees, being afterward translated and changed to other trees, where they never came before, cannot possibly live. Wherefore it is more consonant to reason, and more agreeable to common sense, to affirm that those Worms which are found folded and rolled up in the Snow, to have beenfirst bred in the same Snow, rather then to have iffued

Neither are we to make any queltion or scruple concerning their food; for there is no doubt, but the mother from whence they proceeded, will provide sufficient nourishment for her own children. For as we faid a little before, the Snow is no simple thing, but compacted and concrete together of many, and of this nature ought every aliment to be. Julius Cafar Scalieer is of this minde, that Worms are ingendered and brought forth in the very Snow, because there is in it much air and spirit, which afterwards being heated and brought to some warmth together, may cause them to generate; for it is the nature and quality of Snow to make fat the earth, of which fattish moisture or Jelly, there may (heat being joyned) be produced a living creature.

There be some that do constantly hold, that in the midst of certain stones, of which they use to make Lime, there do breed divers creatures, of very different kindes, and fundry proportions and shapes, and likewise Worms, with hairy backs, and many feet, which are wont to do much hurt to Furnaces and Limbeckils where they make Lynie. Yet Cafalvinus in his first Book De Metal. chap. 2. thinketh the contrary, affuring us that in Metal-mines, Quarries of Marbie, and other stones, there can never any living body be found. And yet in Rocks of the Sea, within the hollow places and rifts of the Rones, they do commonly finde certain small living things called Dadi'i.

I do not doubt, what foever he faith to the contrary, but that many creeping, and other living creatures, may be found both in the secret Mines of stone, and sometimes also amongst Metals, although it be seldom seen. And for confirmation hereof, I will alleadge one example happening not many years fince in our own Countrey. At Harlestone a mile from Holdenby in Northamptonshire, there was a Quarry of free stone found out, of which they digged for the building of Sir Christ ober Hattons house, where there was taken up one being a yard and a half square every way at the least, and being cloven asunder, there was sound in the very midit of ita great Toad alive, but within a very short space after, comming to the open ar, it died. This stone amongst others, was taken very deep out of the earth, it was split and cut asunder by one whose name is Lole, an old man yet living at this day, it was seen of hive hundred persons, Gentlemen and others, of worthy repute and esteem, the most part of them living at this hour, whose attestation may defend me in this report: and surely if Toads may live in the midit of stones. I can see no reason but that Worms may there be found, but as yet I could never see it.

In the year of Grace 970, at what time Romusldus the son of Sergius a young Monk, was advanced by the Nobility of Ravenna to be their Archbishop, there followed a great death and murtein among Earth-worms: after that again ensued scarsity and death of all fruits of the earth, 45 Carolus Sigonius in his Chronicle of the Kingdom of Italy declareth. Henry Emperor of Rime, the son of the Emperour Henry the third, as Cramzius hath written, when he took his voyage into Italy, being suddenly stayed of his intended course, with an Army sent against him by Matild, that he should passe no further then Lombardy, yet having taken Mutina, Agaa

there appeared a strange and uncouth fign in the air, for an innumerable company of Worms, there appeared a strange and uncount light in the air, being so thick that they might be fauller and thinner then any Files, did file about in the air, being so thick that they might be touched with any small flick breadth, and sometimes with the hand, so that they covered the touched with any small sick breadth, and darkned likewise the air two or three miles. touched with any imai fifth of walls, and darkned likewife the air two or three miles in length, face of the earth one mile in breadth, and darkned likewife the air two or three miles in length. face of the earth one mile in orealth, and fome Christian Prince should go into the

In the year of our Lord God one thousand one hundred and four, there were seen divers In the year of our Lord one in fuch an infinite multitude, that they darkened the fiery and flying Worms in the air, in such an infinite multitude, that they darkened the fiery and flying Worms in the sir, in luth an infinite configuration they darkened the light of the Sun, feeming to deprive mens eye-fight thereof; and shortly after this monfrom and unnatural wonder, there followed other strange and seldom-feen prodigious fights on the and unnatural wonder, there to now form of troubles, and raging whirl-winde of War and bloud the shortly after ensued, the event thereof did plainly manifest.

A Physical Index, containing plentiful Remedies for all Diseases incident to the Body of Man, drawn from the several Creatures contained in this First Volum.

THE

THEATER

INSECTS:

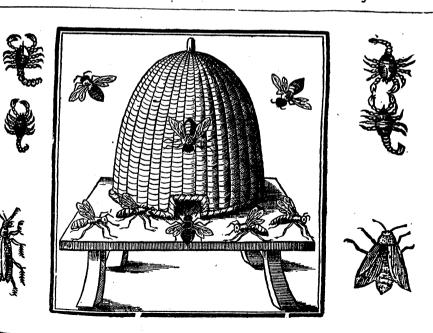

OR,

Lesser living Creatures.

AS,

BEES, FLIES, CATERPILLARS, SPIDRS, WORMS, &c. a most Elaborate Work.

By THO. MOUFFET, Doctor in Physick.

LONDON, Printed by E. C. 1658.

To the Noble Knight, and the Kings chief Physician, Dr. WILLIAM PADDY: Theodore Mayerne, Knight, Baron of St. Albons, and Companion to the chief Physicians in the Court of Britain, wisheth much health.

Our Countryman Mouffet, a notable ornament to the company of Physicians, a man of the more polite and solid learning, and well experienced in most Sciences, had formerly entituled this work of Insects to the ever famous Elizabeth, (who was wife above her Sex, valiant, born to reign well, and ruled so many years by the Votes of her Subjects, and by her own un-

dertakings and actions, that were fo successfeful that they were envied at) it was begun by others, but augmented by him, polithed, and as it now comes forth exactly perfected, and he thought it no indignity to Dedicate to the greatest Princess the miracles of Nature, which are most conspicuous in the smallest things; which testifie the infinite power of the supreme Creator of all things, and raise the mindes of Princes who are the children of the most Highest, to the cause of all causes, that they may in all places acknowledge the presence of the Deity, and his bountiful hand in his fingular direction in respect of them, and his influence that acts by election, and may adore him with an humble, as with a grateful minde; fo weighing by reason the degrees of proportion, that he is most obliged who hath received most. The Author before he could accomplish this purpose, died; he was worthy to have lived longer for the advantage of Art and Learning. Thus the Book was left after his death to his Heir, who had a smaller estate than suited with the name of his Father, or his merit required, and his many watchings and labours sustained for the publick good, in curing of the fick, justly deserved. Fortune is blinde and will hardly favour those that are the best but against her will, as if it were disagreeing and dissonant that there should be any commerce between Pluto with Apollo, Minerva and Mercury. Elizabeth being departed this life, and fames then holding the reins of the British Empire piously and juftly, and ruling peaceably amongst the storms that at that time shook all Europe, having weeded out by his Majestick Scepter, and by the providence of his soul which was prudent even to miracle, all Monsters, which endevoured to shake the foundations of the Kingdome by Treason, Deceit, Wickedness, Lust, and Wrath. The Overicers of this Orphan left in a very poor condition, were resolved to Dedicate this learned Work to this Noble Heros, who was no less famous for his Learning than for a concourse of all Virtues that met in him: but great poverty at home, delayed the bulinels, and hindred this windy intention from taking effect, and the off spring from coming to the light. So the Book lay for a long time in obscurity under the custody of the friends of the Author departed, until such time as it was offered to me by Darnellas, who was formerly his Apothecary, and a very honest man, who wished well to his Mafter being dead, and was very defirous of his glory; so it lay for some years in my Study cast aside in the dust among Worms and Moths; truly it was no fault of mine, but of the Printers who were so greedy of Money, that though in many Countreys linvited them by my Letters, and did solicit them to receive the Orphan, yet they refused (as they said) to take upon them an unthankful business; they were not pleased with the benefit of a noble Art, unless it would pay more than the fraight. O the times wherein the pains of learned men are valued at the price the work will be fold for, and the money that must be laid out for ink and paper, or by the depraved pinion of the vulgar (who commonly applaud what is worft) and not by the effence of thing it felf, or dignity of the subject, or the solid explanation of the same! Then tre was an Epistle prefixed to the beginning which men call Dedicatory, which being it was to carry the name before it of one of the foresaid Princes, the Edition seemed to come anh unseasonably after they were both dead. Perchance some other man would have acht at this occasion, to have brought it to King Charles, the great Son of a great Fa-Ffff 2

ther, under whose foreunate reign in his Kingly person, all Kingly virtues run together in troops, each striving to have the upper hand) and kneeling down before his Majesty, would have offered unto him, in hopes of a reward, another mans Works walf'd with a false cover of commendations, or obscured with the great smoke of courtly eloquence. But I have no fuch genius, for though I have not lived hitherto unwelcome to Princes, yet I have learned by long practile, that we must use their favour soberly, and never to abuse their ears or eyes, and though you do know easie envour ionerry, and never to come into their presence, yet importunity is alwaies unseasonable. and especially that which hires mercenary Muses for money to set them forth, which are branded with marks of infamy. Do not think that I detract so much from this Work that I think it not worthy to carry the name of a King in the Prontispice, and might live in publick under the protection of so ambitious an Inscription; but I held it no less than facriledgeto name the childe in stead of another of my own accord, or to bring a deaf person upon the stage, as to what concerns the exposition of the Argument, and with other birds feathers in the very entrance of the work foolishly and vainly to pride my self: yet that the Book might come forth every way complear, and that the Reader who is a lover of the custome may not desire an Epistle, or complain that there is one wanting, according to my manner (wherewith I honour great men with the honour that belongs unto them, but my friend I respect above all, and that continually) I would prefix to this Natural and Physical History the famous name of some man, who by the common confent of the Learned, is well acquainted with both, and who is joyned unto me by no ordinary alliance, who is dear to all good men, and eminent for his own endowments, which office of Reverence and good will may testifie to posterity, in what esteem such men are with me, who are intrinsecally furnished with the real tineture of manifold learning, but chiefly with that of the most noble Art of all, which I practife: so I have made choice of thee alone among & many, that thou may it be to me in itead of them all, Noble Man, my dearest friend Paddy, who art Knighted by the wifest Monarch Fames, who never did any thing vainly, who adorned thy Virtues by thy Titles, and thy Titles bythy Virtues, as our Thoring hath written of thee. Thou art he who after the wicked Paricide of Great Henry, formerly my most milde Master (which shall for ever convey the said memory of his age to posterity) when I was called by the most Serene Fames from the French Court by his own Letters, and by a guide appointed to conduct me into Britain, and was immediately honoured with the title of Companion of the chief Physicians, didft not look upon me with bleer and swoln eyes, with the viperous venome of envy; but thou didft entertain me, being a stranger, candidly, and with a cheerful countenance, (as it becomes one of noble Birth) contrary to that of Horace, who accuse the Britains divided almost from all the world, of fierceness toward strangers. After that, in the many meetings we had amongst sick people, and in my practise in Physick, when I pleafingly hearkned to the opinions of those that consulted, weighed them, and as it belonged to my place, concluded what was to be done, thou didft hear me without brawling or contradiction, which is the imbred evil custome of some unworthy Physicians; and thou didft very often approve of my opinion, as confonant to reason. In the famous Colledge of London, (where as thou wert alwaies most worthy, fothou wert of ten Prelident) when I was by the votes of the chiefest, and first of all by thy suffage made a Colleague, according to the Kings Character for my place at Court, thou didle willingly suffer me to have the next place to our President : I farther add, that thou didst never oppose thy self to the many petitions or commendations that were offered by me to our most excellent Colleagues, but thou didst alwaies afford me thy ear to hear me, and thy hands to help me. Lastly thou didst alwaies praise me being absent, and as far as it was in thy power, of thy own accord, from the imbred motion of thy noble minde, thou did defend my good name privately wounded by the calumnies of envious men, and torn by malice, (which is the condition of good, and of the greatest Princes) by that authority which thou hast amongst thy own Countreymen of what condition for ver, and thou wouldst not suffer this scab of backbiting to proceed any farther. O most excellent Man! what shall I repay unto thee, who as a true Philosopher, hast no desire of vain glory, and such things as make a great shew and are vulgarly praised, sought for, and defired by other men, are now esteemed base with thee . My grateful minde, and most full of love towards thee, commands me to offer this small token to thee in telli-

The Epiftle Dedicatory:

mony thereof, which accept freely and willingly, and fuffer that by this fincere gift, that wicked faying may be disamulled, that men of one profession cannot endure one the other. God the best and the greatest hath granted unto thee long life, by a prosperous aspect of the Stars, for the good of thy Citizens, whose health thou hast preserved and restored by thy care for very many years effectually hitherto, that posterity must justly acknowledge that thou hast lived long, worthy not only of a Garland of oak, but a Statue of gold alio, (if our times would afford such honour). Now thou well deserving Captain, discharged by age, thou Champion freed by reason of years with a token of honour, thou condueror of monsters, that daily spring up with too truitful an increase for the destruction of mankinde,, dwellest with thy felf, thy foul yet sustaining thy dry body veelding to walling time by degrees very eafily, which being defiled with no conditions of henorison, sees the Haven, and is almost come into it; thy minde being abstracted from the lad yexations, of humane life: and what time thou hast to spare from divine Meditations, penetrating into all Nature, and the fecrets of things, thou doft expatiate into the pleasant green, Gardens of various natural Philosophy. Behold here is a most exquisite Garland for thee gathered out of the most secret Orchard of our great Parent, which will not only feed the eyes, but willilead the fingular acuteness of thy wit, which thou aboundest with into her most hidden places. Thou being an excellent Anatomist, I beseech thee try if thou canft diffect Infects, the great Staggrite being thy guide, who did not disdain to fearch into the parts of Animals. Thou shalt finde in the little body of Bees a bottle which is the receptacle of Honey sucked from flowers, and their legs loaded with Bitumen which sticks fast to make wax. Also in the tail there is a horny sting full of revenging poylon, that is ready to draw forth as foon as the Bee please, but the King of the swarm is said to want one, for there naturally belongs to the supreme power, who can overthrow all when he will at his pleasure, and there ought to be an imbred gentleness, whence it is that Kings by their proper attribute are called Fathers and Pastors of the people. In Gnats you shall observe their founding trumpet that will suck bloud out of Animals, and will draw out moisture through the joynts of the most solid wood, and wine-vessels. How wilt thou be pleased to see the small proboscis of Butterflies wreathed alwaies into a spiral line, after they have drawn forth nutriment from flowers, their extended large wings painted by natures artificial pencil, with paints cannot beimitated; to which the very Rain-bow is scarse comparable;

Which right against the Sun athousand colours showes.

What a pleafant spectacle will this be when the artificial hands carefully and carioufly guide the most sharp pen-knife, and very fine instrument by direction of the fight! To behold the pipe of the Grashoppers that live upon dew, and the organs of the shril found they make, that in the heat of the Dog-da es importunately beats upon the ears oftravellers, which are so framed, that their concave belly is made vaulted under the Disphragm, over which is extended a cover of a thin and dry membrane, like to a Drum, which lets in the air by an oblique turning, which being beaten by the regular and succeffive motion of their wings, and stomach, coming in at a strat passage, and presently dilated, beating against the rough-cast wals of the hollow place, and refracted, makes a found. To see the horns of the great Beetles, that are like to Stags horns, and with harpest points are able to make wounds, and the muscles that move them, and tye them on exceeding fast. The Rhinoceros is of the kinde of great Beetles. The swelling purse which is the matter of the filk, and is wound back again into many turnings, by Silk-worms which are chief of all Caterpillers, of divers forms and colours; in which after the time destinated for the concoction of their food, which is gathered chiefly from Mulberry-leaves, a tenacious glew or jelly is reserved, untill such time as their ventricle swelling, and nature affecting to attain her end, the Worm by degrees belcheth forth her spittle, the thred whereof growing firm by the air (which is provided to make garmenis for great men) this little creature dispenseth through her very narrow claws, and pinning with the motion of her head and or half her body, with the kembing of it by the help of her forefeet; she first disposeth it for the strengthning of her clew of yarn, ind after that upon her own sepulchre where she must receive her transmutation. How the Spider thrufts out her excrements by her lower parts of her body, which is drawn

Ffff 3

forth into a web, of which the poor creature frames nets with great labour, which are necessary to lustain her life, and with her long legs that end in sharp clawes, she knits them into knots; being continually obnoxious to repair her work. In the uppermost cases of the green Locusts which feed upon hedges, there are two scales that are hard as torn, the mutual rubbing together whereof by the ministration of the air beaten with their fofter wings, make a very sharp found. The head of all of this kinde is armed, their hinder legs are hard, dry, long, by the vehement thrusting whereof against some firm object, with the help of their most strong tendons, they will cast their body a great way, being equally ballanced, and is heavy enough for the proportion of it, like an arrow coming forth of a bow, as it happens to Fleas that leap with a huge force. But which is yet more, besides their pincers which are as sharp as keen rasors, where is a direct pisfage from their mouth to their tail; the pylorus is compassed sout with toothed bars, that answer one the other with a thorny gomphosis, wherewith they destroy whole fields with devouring fore-teeth, like chizels, and grinde them as it were in a mill, and very fuddenly they void it forth again 3 their hunger never ceases until the vile creatures have confumed whole Countreys which God is angry with, divine revenge commanding them, and brings to nought that people, who ridiculously threaten heaven with destruction. You shall see the sharp spears that arm the mouth of the Spiders Phalangia, and by the small wounds they make, a strange venome enters, and penetrates into the center of the body, and flicks fast to the deepest marrow, lasting so long in the subject that receives it as the cruel beast lives, and is exasperated periodically at certain hours, troubling the phantalie of the persons wounded, which is abated with colours objected like to this Spider; yet it ceaseth not to rage, until musick causeth them to dance, and provokes them to sweat abundantly, whereby the paroxysm is dissolved, which the day following returns at the same hour. You shall behold the internal fire of Glow-worms fastned to their tails, and the torches of the Indian Cocuia that shines in the night, and overcomes Cimmerian darkness. And moreover, if you take lenticular optick Glasses of crystal, (for though you have Lynx his eyes, these are necessary in searching after Atoms) you will admire to see the dark red colour of the Fleas that are curasheers, and their back sliffe with briftles, their legs rough with hair, and between two foreyards there stands a hollow trunk to torture men, which is a bitter plague to maids, and is the greatest enemy to humane rest, especially when that men would sleep. You shall see the eyes of the Lice sticking forth, and their horns, their body crannied all over, their whole substance diaphanous, and through that, the motion of their heart and bloud, as if it floted in Enripus. There will appear to thee the flat bodies of the petulant Crab lice, with their grapples, wherewith they perpetually lance mans skin between the hair with their mouth, and stick on faster than Cockles do to the rocks. Also little Hand-worms which are indivisible they are so small, being with a needle pickt forth of their trenches neer the pools of water which they have made in the skin, and being laid upon ones nail, will discover by the Sun-light their red heads, and feet they creep withall. And if from the inspection of parts you will recal your minde to consider the generation and beginning of Insects, and will weigh the various transmutations which they undergoe, as of Worms into Flies, of Catterpillers (the several species whereof have their original from the corruption of feveral vegetables) into Chrysallides, (that shine as if leaves of gold were laid upon them) and Butterflies, whose egges again produce an off-spring like Worms, Nature acting successively in a circle, and constantly by a perpetual motion running back into her self: you will doubtless enter upon a large field of Philosophy concerning three Kingdoms of the universal spirit, (the Vegetable, Animal, and Mineral) equally penetrating, replenishing, and governing, and upon the power and activity of it, introducing divers forms into beings that pertain to each of them, according to the disposition of the matter: also the commerce of all sublunary bodies amongst themselves will exercise your contemplation, which though oft times they feem to fight one against the other face to face, yet they agree in one, and from one the other, all and each of them borrow something. And if Animals and Plants be transmuted, why should that be denied to Metals? which thing, many genuine Minifters and legitimate helpers of Nature boaft, and not without reason, that they can doit by Art: and that only by removing of impediments, and by a convenient application together of actives and passives; which being done, the Philosopher leaves the who's

The Epistle Dedicatory.

work to Nature only, which by a gentle outward hear, being helped without too much haste, doth raise up an internal fire, which is the Workmaster of the Elixir that must procure health and riches: that I may hisse out Asses, who triumphing in the Lions skin, creck a tumultuous and confused furniture in their Laboratories, and dig forth all things under ground from the very bottoms of Mines, and melt them in the fire, being desirous to make trial of their own dreams.

Their Patrimonies they together pack, Plying their hidden work with Coles full black, When they have spent, and labour d all in wain, Nothing they finde, nothing they seek again.

But passing over these blowers of the Ashes, if you be pleased to reason deeper concerning Insects; you shall finde what will exercise you in the Monarchical government of Bees, the Democratical of Ants, and the economical providence of them both: of that in gathering and laying sup Wax and Hony: of this in replenshing her granaries, and biting afunder the grains of corn, at that end where they fpring forth, left the provision which is gathered with hard labour, and laid up for winter, by the force of an imbred heat in their work-house under ground (which is hor whilest the Winter lasts) should corrupt, being spoyled by a sudden production, and a plague arising, together with a famine overspreading, should destroy the whole nest. Nor can you lightly pass over the Architecture in framing the cells in the combs of war, mathematically to an exact Hexagon; in the hollow places of a Wasps nest; in the various chambers of the Ant-hill, and winding Meanders sin the joyning together whereof he saw granaries, chambers, hospitals, places of burial, besides the innumerable endowments of these indefatigable creatures, their functions and labours, and he could not admire or praise them sufficiently, who had spent a long time in the contemplation of them, thinking it a work worth his pains, his whole life past being employed in this negligent and very idle business. Silk-worms, all Caterpillars, and Spiders, shew their art in spinning, making snares for Flies, and pitching their nets to provide themselves victuals. The Wood worms pradife graving, with the rasp of their mouthes piercing into the timber : Ants and Bees, amongst other Insects, will teach men piety toward old men, tired, siek men, and their ownchildren: Oyl Beetles facred to Apollo, will teach them to love their off fpring, who never cease for 28 daies to rowl up and down a dung-pil, (which is the receptacle of their feed) from East to West, following the Suns motion, until it be fit to hide in the ground for the production of their young, after the space of a Lunar moneth, which nature hath affiened for the forming, and excluding of this Worm, which shall at length become a Fly. Here take notice that the male hath a prolifick feed without help of the female, and can generate by it self putrefaction of fit matter interceding in a convenient matrix, though it be not animal. But (that which crowns all the meditations of a Christian man, and carrieth him aloft) consider how the Silk-worm makes her self a tombe. that is unpaffable, by reason of her woven work that is most compacted within, in which the Worm contracted into it self seems to die, and by a prodigious metamorphosis it is born anew a Butterfly, a mo e noble creature, which by the weaving of its wings flies up into the air toward heaven, whereas before its burial it lived a base creeping creature fastred to the earth, and glued to the food of the ground. See whether a little beast that is obscure, of the kinde of Locusts, living amongst the stubble of the fields, when heis consumed with extreme leanness (which from the posture of one that is praying, the French men of Narbon call Pregadien) do not teach men to hold up their hands in prayer unto heaven, and admonish them to observe a convenient gesture in offering up their supplications unto God. What think you of the greater Beetle, the Indian Rhinoceros, which being bred without a female (as the rest of the like kindes are) dies, and riseth again out of her own corruption, like a Pkoenix, after her change, when she was supposed to be wholly dead. Lastly, what think you of Flies, which when they are drown'd many hours in water, if you bury them in hot embers, you shall revive them again. Truly I doubt not but that among st those serious cogitations, (the object whereof will seem not so serious in respect of other false appearances of men, that are illiterate and unreafonable) thy minde may rife to its original, and fastning thy eyes on heaven inspired by

P 1116 "

Tibe Epistle Dedicatory.

God, wilt cry out, O the depth! and with the divine Psalmist wilt return a Psalm of thanks to the Maker of Nature: How wonderful are thy works O Lord! In wildem half thanks to the live white earth is full with thy possession. So hall I have whiteby I may rejoyce, that however the whole course of thy age hitherto hath been but one continual act of Philosophy, yet that by the rare advantage of this Present which is curious with variety, I have given thee a new occasion of no less solid and profitable, than of pleafant and ingenious meditation. Suffer therefore that a friendly hand may convey into your L. brary the Off spring of the most learned Mouffet, which is now at last published your Library the on and amongst so many volumes wherewith thy Study shelfs are most excellently furnished, assign a place for it, worthy of the Father and the Son. Befides the good things mentioned that shall from thence accrew unto thee, and the very great increase thou shalt reap from the hours thou shalt spend in reading the Book, (if I may jest with thee) thy own profit shall not want its advantage, lest thy proper benefit should here seem to be neglected. In these leaves thou shalt finde what will drive away the plague of thy delights, those beasts that are the greatest enemies to the Muses & their darlings, I mean the Moths that devour Books, which with a greedy belly and iron teeth (though their bodies be very smal) prodigally waste and rend the lucubrations of whole ages. Let those evil beasts that are the most deadly mischiefs of angry nature be destroyed after an ill manner: to prevent the propagation whereof, and to kill their infamous progeny (whilest in the mean time learned writers of Books endevour to abolish their kinde utterly, or their sedulous Collectors do what they can this Book (which I fend to thee as a remembrance of my love, will teach thee in the Chapter that treats of it. But let it suffice, I began with a small pitcher, why should thewheel run till it fill an Amphora . The heat of good will and fruitfulnels of the subject carry me away, I must now take off my hand, lest my Epistle should proceed absurdly beyond the bounds, which already unawares hath increased into a volume. Believe that I am affectionated to thee, and how well I wish and defire to thee, these lines I have written may speak. What remains of thy daies which God hath appointed thee to runthe race of thy life, before thou receive thy heavenly reward, I wish thou maist finish without any pain of minde or body ; and that I may speak with Arifforle writing his last Testament, I pray from my heart, that thou mailt live longer here, for is is well, but if any thing happen, that thou maift safely arrive and enter gloriously into the harbour of the blelled at the moment decreed. Farewel.

A

From my Study in the Ides of May, and the year of Mans Redemption, 1634.

A Preface upon the undertaking of this Argument; and of the worth and use of it.

Has the History of Insects is worthy of the chiefest Philosophers, the pains of great Aristotle, and Pliny, and of our Wotton in describing them doth sufficiently demonfrate. After their time Conradus Geiner laboured not unfruitfully, to perfect that work which they began; but by reason of his short life, he fainted in the beginning of the race, nor was he able to put an end to it. But when Pennius of blilled memory met with those papers by a better fate, for fifteen years together by infinite reading of all Authors, he enriched the History by the exceeding great help of Quickelbergius, Clusius, Camerarius, Sir Thomas Knivet, and of his most learned brother Edmund, Jo. Jacob, Roger Broun, Brite, but chiefly of our Bruer, and some courtelle of Peter Turner. That is to be lamented, that he also was taken away by untimely death, before he had disposed of the matter and framed it to the dignity of this work, which he had heaped up together on all sides; Hence it was that his Letters were full of blots, and confused with doubtful Characters: and they had perished, had not I laid them apart, when they were ready to be cast out of doors and with a great sum of money bad redeemed all the torn pieces of it. For I had rather something should be taken of from my own estate, than from his glory, who had spent so much pains in the de-(cription of Infects, and to much money for the Plates engraving; wherefore this Mans and Geiners and Wottons fragments being disposed in order, adding to them the light of oratory which Pennius manted, I forged the History, and according to my abilities, (which Iknow how small they are) I at last brought it to a period. At first I was deterred from itby the difficulty of the works because I saw that Insects are hard to be explained, both in respect of the unusualness of the subject, and also of the sublime or rather supine negligence of our Anceftors in this point: for they stood still in the very entrance, and they saluted them only by the way, or as the proverbis, at the threshold of the door. I allo feared that (which fell out it may be) lest there should want dignity of oratory, for so exquisite a Narration; chiefly when as I oft observed Pennius to be gravelled here. and I seldom went to those that were Artists of words. Also for a time I was detained by examining the causes of Insects; which being unknown, the History can neither be well pen'd, nor rightly conceived. Moreover friends checkt me (and that sharply) that I did but rough-cast another mans building; as though I were one who sought for the Garland in every business, and thirsted after glory more than it was fit for me. They said more over, that since some worthy honest and profitable end must be propounded to every business that urightly undertaken, yet none of these was to be found in these imperfect creatures, but I should lose my time, charge and labour exceedingly. By these hinderances I was as it were made fast to an anchor, and left off for a short time to sail any farther: and sometimes taking up my pen, sometimes casting it away again, I was in divers mindes, until that certain reasons allayed these florings of my thoughts, and did again kindle, " it were, a desire in me to hoise up sail again. I opposed against the difficulty of the work, the delire of attempting things that were very difficult; remembring that for nine years Troy seemed to be impregnable, but was taken in the tenth year it was beleaguered. As for the dignity of the style, I was perswaded that men of Sound judgement would not consider how neatly, but bow well I discovered the nature of Infects, for however some mens vain wits, desire much affected eloquence, yet those that esteem of things soborty, altogether reject it. I put off the ignorance of the tinger, with the answer of Theophrastus, who though he sunk under his too earnest enquiring after them in plants, yet be did not conceal so profitable a History. It shatl suffice us to have measured the causes by humane capacity and mete-yard, for as it is the part

of an ambitious manto promise a certain knowledge of them which is only in God, so to have no knowledge of them at all, is the part of a beaft. The example of Galen, 100k Augus from me the fourth scruple I had, who though he added to Hippocrates but a few things. except the grace of Oratory, and did only open that way of Phylick which be bad lit down yet is he fo placed in the second rank amongs Physicians, that many think him worthy to have the first. Which thing I have not only done in this book, (I am willing worsny to nave the frust concerning my own work) but I have inserted intire IListories, and above a bundred and fifty pictures, which Geiner and Pennius knew not , I have mended the a numero and jujo per and I have put out above a thousand sautologies, trivial matters. and things unseasonably spoken: for I have had regard to the squemish stomachs of men of this nauscattng age, that not only loathe Coleworts twice sod, but even Ambrosatwice Cet upon the table. Notwithstanding how small soever this my pains may appear, (for he cannot be thought no pains) be that (hall make trial in something of this nature, he will rightly perceive my labour, and will of his own accord take beed how be go to repair old and decared houses, with new matter; it had been better to have written a new History than to have mended this which was fo tattered and confused, As for vainglory, I de fire it may be as far from me, as I wish the light of this History may be near to you. I confiss that not to love honour is contrary to mine, and all humane nature, yet lo that I hold boafting to be among ft the greatest vices, and I equally reject foolish oftentation in [mall matters. Socrates, Plato, Hippocrates, have taught us better, who in their times both writ many things, and were exceeding far from the ambition of glory. I know not whether they are to be numbred among & men most desirous of honour, who publishing nothing of their own, make unlearned men to conceive of them, that they abound with hidden learning , as if they were like bottles for footh, that were fo full, that they drop we-17 flowly or not at all. I shall add this concerning the dignity of this History of Insects. (left we should think God made them in vain, or we describe them) that in the universal world there is nothing more divine than thefe, except Man. For however in him they are most abject and fordid, yet if we look more nicely into them, they will appear far otherwife than they promife in the bare outside. It oft times comes into my minde (faith Gallifardus) to think of our Italians, who commonly admire vehemently things mushle for magnitude, or new and unufual, but things obvious in all places, and that are very small they dispise, yet if they look exactly to the matter, it will be easie to observe, this the divine force and power show themselves more effectually in mean things, and the are far more miraculous, than those things the world with open mouth respects omuch and admires. If any man bring from far the wonderful Bittour, Elephant, Crocodile, there is no men but runs quickly to fee that, because it is a new thing and unusaal, and when they have leave to fee them as much as they will, they only wonder at their greatness, colour, and such things as fall under the apprehension of their senses. But no man vegards Hand-worms, Worms in Wine, Earwigs Fleas , because they are obvious to all men, and very small, as if they were but the pastimes of lascivious and drunken Nature, and that she had been sober only in making those huge and terrible beasts. Nor is this will pecultar to the Italians only, but it is common to the English and to all mankinde, who that they may fee those large beasts that carry towers, the African Lion, the huge Whale, the Rhinoceros, the Bear and Bull, take sometimes a long journey to London, and 14) money for their places on the scaffold, to behold them brought upon the stage: jet white is Nature more to be feenthan in the smallest matters, where she is entirely all ! for in great bodies the workmanship is easte, the matter being duttile, but in these that are se fmall and despicable, and almost nothing, what care? how great is the effect of it? how unspeakable is the perfectione as Pliny saith. Do you require Prudence? regard the Ant, Do you desire Justice : regard the Bee ; Do you commend Impirance ! take advice of them both. Do you praise valour : see the whole generation of Grashoppers. Alfo look upon the Gnat (a little Infest not worth speaking of) that with bit fiender hollow nose will penetrate so far into the thick skin of the Lion, that thou cans hardly or not at all thrust a sword or javelinin so far. A man hath need of seel to but into oaks, which the Wood-werm eats hollow with her teeth as the found can teffi fie, and as if the had Polycletus his graving instrument, the carves out seales. But if I would relate the skill of some of them in building, fighting, playing, working, perhaps I might be thought over curious in these small things, (of which the Law takes no notice) and

The Preface.

work nigligens in greater matters. Now I come to their ufe, and that manifold, and in ispet who God to Nature, or to Main, very great. For if the Gentles according while of the Capoble Paul; Know God by the creatures i truly they may bear, u from a biglier watch-tower behold his Omnipotence, Majefty, Providence. For the Wyban are To Imall, that like thofe lines Callicrates drem, they cannot be feen bit with sold that and when the Sun Stiner very bright : as I remember I once fan a Ry far imiller than a Worm in wine: Would you have a Musician? bearken to the Grasbupper which is alwaises filled wish finging, and lives without meat, and by her most pleasans miledy challengeth the Nightingal. Would you hear a Trumpeter ! bold your ear to the Beehibe bear the bamming note: bearken a little to the Gnas, in whole finall beak the great Mafter workman hash formed shat borrid and stanging found of the Trumpes. Do you de file a Longe e jet when the Egyptian Magicians deceived Pharach by producing the orenitr creatures, in the forming of this fo contemptible a creature they yeelded the garland to Males Wherefore Galen (17. de ulu partium) breaks forth rightly into thele word; ifwith had explained the wonderful generation of bairs, and the ufo of them : faith be. If there be fo divine vertue in parts that are fo fordid and nothing confiderable, how great may we suppose the excellency of the same is which rules in the heart and brain? Truly if aman that is addicted to no feet, would freely enter into the confideration of things, confidering the fabrick of any even the finalich creature, and that in every partthough never so base, so great verrue resides, he shall easily understand the excellency of the minde which is in man, and from the principles in phylick shall ascend to Divinity, which is far better and more excellent than all Physick." I suppose that no nation not fociety of men amongst whom there is any Religion of the gods, have any thing comparable to the Bleulinian or Samothracian Ceremonies , yet thefe do fet forth but obscurely the minde of all things which they profess, which is plain enough in the fabrick of all living creatures. For you must not think that in Man only the Art of the great Artificer is fo great, as I have explained before, but what creature foeger you would diffect, you shall finde the like art and wifdome to appear in it. And such creatures as you cannot possibly diffect, will make you to admire the more. the smaller they are. For if a certain Carver lately obtained exceeding great commendations, and that deservedly, because on a very small Ring he so curiously engraved Phasin riding in his chariot with four horses, that you might see their mouthes, bits, teeth, 16 feet, and all their parts exactly framed : truly fince all that workmanship had nothing in it more excellent than the leg of a Flea, it is evident that God that made the Flez, hath more Art and Excellency in him, that not only made it, but that he did it without any labour, and when he hath made it, doth continually feed and nourillitie. Wherefire let us leave off to admire any longer the wast and huge Calose, and with the shief Master of true wildome, let us descend from the Cedar to the fornb, that is, from the mil highest trees to the most contemptible weeds, or rather the most abject of all wegitables. And if he thought that the history of the meanest plant was not unworthy of a King to contemplate and write of, how much more excellent are Animals than Plants, to much more doth this work deferve the patronage of a King, and philosophical contemplatienthan that doth. When Heraclides had invited fome of his friends to bis poor Cottige, they flood only before the door, being afraid to come in because the place was so narrow of the room fo foul: to whom he spake thus: I pray come in, here are Gods illo: ibereby implying that the greatest God was in the smallest matters, and that there nua spirit in all things, though never so despicable. And truly, if the fabrick of Inletts were worthy of so great and divine Artificer, how can the contemplation of them be anworthy of the understandings of poor contemptible mens Among & the fouldiers of Palettina, God raifed great Goliah, a Giant among ft men, yet would he have him overshrown by the fing of one poor shephard. Amongst the Spanish Pilots, how many tall Mariners there' vere the they all submitted to one small Drake, and Neptune himself in a manner relded up bis Mace to him. The Oke is great, and growes very large, but God deriges it by the flender Ivy that clings about it, that it might not grow proud of its we and might. Farewel then all those that so much esteem of creatures that are very loge, I acknowledge God appears in their magnitude, yet I fee more of God in the Rilay of leffer Creatures. For here is more of prudence, sagacity, art, ingenuity, and of main evident divine being. Wouldst thou praise Mature, Gods ordinary hand & from *bence

whence wouldst than take thy beginning better than from Infetts e for where hath be plan. unence womany fenfes in a Gnot ? where (faith Pliny) hath ha fet the eyes & where the smel. ling & with what curiosity bath he fastned the wings ? with what great art hath he ex. ling? mish more currously nain we just the hungry hollow belly, and bash made it things ended the small legs? and disposed the hungry hollow belly, and bash made it things after mans bloud; and as the small beak is bash cannot be seen, he hash so made is disposed to make and hall the state of the same action and hall the same actions and the same actions are same actions. ble by a reciprocal art, that is should be sharp pointed to enter, and bollow to draw it forth. pie pla reciprocat armitable variety, comeliness, and fecundity that is in Insects, which commend the riches of quickning Nature in greater multitudes, and fet forth unto us the mend the riches of quickning Nature in greater multitudes, and fet forth unto us the great plenty of it, which cannot be exhausted. If you consider men, as they care almost all great plenty of it, which cannot be exhausted. areas prenty of its works bodies, (as I Shall destare more at large in their History) so they furnish their mindes with variety of examples of vertues, whereby they may instruct their souls, and teach them, that otherwise would be very wicked. Wherefore Solomon theprin. Jones, and sense service wifdome amongst men, fends sluggards to the Auts hill, and sumul. snows people to the bands of Locusts, and incites mortal men to the contemplation of the Spiders in their houses, that from the School of Insects we may learn versue, and may lift ap our eyes unto the power of God, which are too much turned away from him. Go to faith Tertullian, O Man thou relieft upon thy own strength, and distrustest God, yet confider that there is so great strength in the smallest creature he hath made, that thou canst not endure it, nor ever be able to do as much. Imitate if thou canst the Spiderscuriosis, andure the sting of the Spider Phalangium, avoid the nastiness of Lice, take a Gnat on of thy throat, fleep when Fleas or Wiglice bite fiercely, keep thy trees fafe from Cate. pillers, drive away Weavils, Trees-worms, Vine-worms, and Timber-worms wherefore as God flews bis power more in this more notable Artifice of Infects, so his great mercy is more apparent, because there is hardly any disease of the minde or body, but aremedy may be feacht from this store-house to cure them both. If men should deny that they centribute very much to feed, and fat, and cure many other creatures, Birds and Fiftes would plead for them, and the brute beafts that feed on grass would speak in their behalf: wherefore though with many every thing that is new, or hard to obtain, is mel valued, and this is accused by the perversenes of micked men, and ignorance of unharned mun, tabe a work of curiofity, oftentation, and of no profit,

> Yet fee its shape of things that are so small, Nature, and Fate, and great originall.

Wherefore I exhart those chief mon, which I named at the beginning, who have described excellent well in the Hiftory of Injects, by communicating both the things themselves and abely pictures, that with that humanity they have been afifting to me, and to Pennius hitherto they would continually proceed in the same for the augmenting of this work : for the submenting of this work : for the submenting of this work is they are Physicians sons, and shall most amply set forth the clory of God and Nature. To which if I may appear to have had as much regard at I have had to the certain profit of men by this work, I shall not regard the envy of any man; for I never studied to please all men, and yet I alwases enderoured to offer unto the Cruston of all things, some part of thankfulness.

Of lesser living Creatures.

CHAP. I.

Of the Names, Description, and Differences of Bees.

F all Insects, Bees are the principal and are chiefly to be admired, being the only creature of that kinde, framed for the nourishment of Man; but the rest are procreated either to be useful in physick, or for delight of the eyes, the pleasure of the ears, or the compleating and ornament of the body; the Bee doth exced them all in every one of these.

Hebrewes, Deborah.

Arabians, albara Nahalea Zabar.

Illyrians, Weziela.

Italians, ape, api, una fiicha, moscatella, ape a scoppa, pecchi.
Spaniards, Abeia.
They are called by the strench, monsches a miel.

Germans, ein ymme bynle.

English, Bee, bees, been.

Flandrians, Bie.

Polonians, Pztzota.

Irish, Camlii.

The Grecians give divers names to Bees, according to the diversity of Nations, Countreys, and places; for divers nations do attribute divers names to them. But the most common and rulgar name is whom, (but Hessed cals the Bee make,) because they are busied in their work, and it makes or because of their sweetnesse, or rather med it was, in regard of their honey, in making of which the Bee is a cunning artificer. For they are ubirial, from union, because there is no Insect more studious, more industrious, and laborious. Hesiod calls them measures as also drying Gesser had rather read meas for mixin, for it is also called grown by Saiden. Aristotle, and other productions of the saiden. Aristotle, and other productions of the saiden. Aristotle, and other productions of the saiden. and others, do rather make it a Hornet or a Wasp. Although Gaza's interpretation, and the Poets do call it Apisa Bee. Stephanus calleth them outsides, whence outside, that is, I do hive Bees, Hefschine calleth one kinde of Bee ofern, and others call it mades from its framing. They are called also from their destroying of flowers destroys, that is, destroy-flowers; or gas that is, yellow, from their natural soyl and seed supposes; and in regard they have blunter strings than M. than Wass, often, and from the sound and buzzing noise of their wings southers, when he writeth that some have writing paise of southers. But Bombus is properly the noise Bees make: dexis, among so many significations, saith Hesselm, Else uniform substances, a kinde of singlesse see; Isdom cally the winds of the southers and the winds of the southers are the winds of the southers and the winds of the winds of the winds of the southers are the winds of the southers are the winds of the w beth him the King or Emperor of the Honey-tents. In respect of his common inheritance, he

The Name:

CHAP. 1.

is called deelder, an airy inhabitant; in respect of its countrey dipoler, as it were the Trojan woodis called areas, an any uniablean, in the second and names from their offices and imployments, as fome are called inches, from their command, fonce and imployments, as fome are called inches, from their command in formation from allers and formation from allers are called inches. sees do lecure themselves home. Varro calleth them sometimes Birds, but improperly, for fects by one name, Apes of Bees. Vario cancelled Bees, because improperly, for Apes of Bees they are flying creatures but not Birds. Some think they are called Bees, because their swames whence so called bees together by the feet, like a bunch of grapes. And beside the most conceive that this do cleave together by that this name of Apes is corapounded of a a privative particle, and pes, a foot, as if they were produced of the production of the pr name of Apes is compounded of a parameter prime, that is, lame or deprived of feet. Some ced without feet, as Virgil faith, Transa pedam prime, that is, lame or deprived of feet. Some view is of the same opinion. And truly the new fresh brook-(which the Grecians call adds) do want feet, but in the time appointed by nature, out of the crulty and waxy comb the Bee do want teet, but in the time appeared it keepeth not this analogie of the name of Biper, edit, Tripu. continue of the name is more simple, from whence comes the Diminutive Apicula. Or 1 lirrle Bee.

The Definition The Bee is an Infect flying creature, four-winged, bloudleffe, skilful only in his artificial The Denniti- Ine Dee is all allocation of the Bee making of honey. For he that wort the Garden of Health, seemed to dote much by confidently affirming that Bees, were four-footed beafts, for Nature only believed on them four feet that they might go uptight, and not more, lest it might hinder their flying. But offitting this suite Author, let us more amply describe this most profitable and wife Infect.

ption of the Bee.

Their eyes are horney and made inwardly, and so is their sting, neither do they want tongue, and teeth; they have four wings, which are dry (as those of all other Insects) shining, and fulned or joyned to their shoulders, the last whereof are the least, that they might not hinder their flying; two clawes as it were growing forth of the ends of their little feet, between which in stormy weather they carry a stone to poise and ballance their light bodies, lest the impenous violence of the wind should drive them from their houses; and therefore we need not give credit to Lucian, that they ought to be called Zaa anoth, footlesse creatures. They do not breath (by Pliny's favour) but pant, and are refreshed by transpiration. Their somath is framed of the most thin membrane, wherein they not only conserve and keep their colleded honey, but concoct, and purifie it; which is the reason that Bees honey may be kept longer then any Manna or aerial body, or rather is altogether incorruprible, as we will flew here-

Aristotle 9. Hist. cap. 10. faith that there are nine kindes of Bees, fix whereof are sociable, and do live together, as Bees, the Kings of Bees, Drones, Wasps, Hornets, Moths, Also three folitary and infociable, the greater Siren, the lefter Siren, and the Bumble-Bee; of Which kinde Simius Albertus does reckon up nine, but gives them such harsh and barbarous names, that is

seems he rather faigned them, than knew them. Lib. 8. trast. 4. cap. 2. But Bees do differ, and are diffinguished in regard of their matter, form, wir, dispositionand

office, and these are all their genuine, and natural differences, which I have collected out of infinite. Authors. Concerning their matter (if we may credit the curious searchers into the works of nature) some of them are called Atologoisis, or the Lions brood; others raveryisis, the Bulls brood; and some Bimule, or the Oxe brood; and some mose ment, or the Calves brood. But the best and noblest bees are generated and bred out of the Lion, and the Kings and Princes of them do derive their pedegree and descent from the brain of the Lion, being the most excellent part of his body: it is no wonder therefore if they proceeding and coming from so generous a slock do affail the greatest bents, and being endued with a Lion-like courage, do fear nothing. The noblest Bees next unto these, are those that are generated out of the Bull, being also a strong and valiant beaft, the excellency both of their disposition and bodies being equal to their sockand pedegree. The next are the Cow-Bees, or Oxe-Bees, which are indeed very industrious, laboious and profitable, but of a milder disposition, and lesse inclinable to anger. The Calves cartalle doth generate more foft and tender Bees, excellent makers of honey, but not able to endure labour, in regard of their tendernesse, and in regard of the weaknesse of their matter short lived Some also do write, that Bees may be bred out of their own ashes sprinkled with hopely and laid forth in the sun, or some warm place, which fort may be called in Greek distings or The difference Self-begetters. Bees of the best shape are small, variously coloured, round, and bending, the of their shapes worser shaped are long. The difference of their formes and shapes arisest from four causes; from nature, ture, place, fexe, and age. For some are domestick, or house Bees; others, are wide or wood Bees, these delight in the familiarity and company of men, but not the otheral which do execute themselves in making the familiarity and company of men, but not the otheral which do execute themselves in making the familiarity and company of men, but not the otheral which do execute themselves in making the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute themselves in the familiarity and company of men, but not the otheral which do execute the men and the familiarity and company of men and the familiarity and the familiarity and the f themselves in making honey in trees, clefts and crannies of the earth, and in the rubbidge of old houses and walls. old houses and walls. Again, some of the tame and gentler sort of Bees, do live in plet fant gardens, decked and beautified with all forts of flowers, these are great, soft, fat and large bellied; others are kept in villages, going far for their food, and feed on flowers they like upon by chance. The lesser more harry, yet for their work, industry and skill, they exceed the other. Of both kindes come are harry, yet for their work, industry and skill, they exceed the other. Of both kindes forme are bred with stings (as all true Bees are) and others without high as the bases are bred with stings (as all true Bees are) as the baltard Bees, which have a greater and fofter belly, throat and body, but not famouse ther for manners or incoming them of ther for manners, or ingenuity. They call this kinde of Bee the Drone, because they seem to

be laborious, and are not; or because under the colour of labour (for they sometimes carry wax and diligently fashion their combs) they devout the honey. And these are of a black shining colour and larger bodied. Moreover some bees are descended from their Kings and Dukes, whereof Arifold maketh two kindes. The yellow, which is the best, and the black streaked Others do reckon three Kings, differing in colours, black, red, and sported, or streaked. Mene times doth report, that the divers coloured are an inferior fort of Bees; but those threaked and divertised with black, are the better. All of them are twice as big as other Bees. He that is Wested Monarch or King of the whole Swarm; is alwaies of an excellent shape and twice as high as my of the reft; his Wings are shorter, his thighs straight and strong, his gate loftier, his same stately and majestical, and on his forhead a white spot like a shining Diadem or Clouds, differing much from vulgar Bees in regard of his shining colour. But the place sich alter, fornetimes their form, and fometimes their nature, fex also and age do change then in both respects. For in the Molnero Islands Bees are like to winged Ants, but some what lefter than the greater fort, as Maximilianus Transstvanus in his Epittle to the Bishop of Salipare eloquently relateth: In America near the Rivers of Vaffes and Plate, the Bees are nor like ours, being no bigger than those small flies which trouble us in summer, they build their nells in hollow trees, and they make far greater combs and fuller of holes; the end or tip of their wings (as Oviedus and Theverus relate) feem to be bitten or cut off, in the middle whereof they have a white spot, and they have no oftensive stings. The wax which they make is of a duskish pitchy colour, and they are for the most part evil conditioned. Ariffold lib. 5. hiff. CAD. 22. mentioneth a certain kinde of Bee, that is of a fost industrious nature, which maketh honey twice in a moneth, being of a gentle pleasing disposition, and bused only in making of honey. Such there are also in the Countrey of Pern, which do make a fost and melting kinds of honey, which do ftop their doors to close with wax, that they leave but a very small hole for their ingresse or egresse. But almost all our Bees in Europe are of a blackish colour, not so much in regard of the easie concoction of thin substance, than that they seem to be of a grosser dier, and of a thicker composure, and therefore the thicker matter doth remain within the skins which the Bees of Peru and Pontus, by reason of their thin skins, and the finenelle of their dewy nourishment, do easily thrust forth; unlesse that be the cause, we must ascribe the variety of cofour, to wanton nature: as we do for white bears, and white black-birds; which feeing the her felf is various and of many shapes, it is no wonder, fince she delights in variety of columns that the hath not made all Bees of one colour. The kindes of common Bees, (as Columella observes out of Aristotle) are thus distinguished; some are great, round, black, hairy: others are leffe, round, of a dark colour, rough hair to there are yet others leffe than they, and not to rounds but more far, of a straw colour on their sides: there are some least of all, very slender, sharp, whole bellies are various coloured from yellow, and very small. But the blackish are most to be approved of, that are very little, round, lively, shining, gentle, having (if we credit Virgil)

Their bodies shine with equall spots of gold.

The greater Bees are, and fatter or longer, the worse they are: and if they be sierce and was? The difference pilh, they are worst of all. But their anger is pacified by the daily company of their keeper, and of their minds they are made more tame with the only tinckling of braffe. The Boes called Chalcoides in Cretes from the place, are of a brazen colour, and something long, and are said to be very implacable and given to fighting, exceeding all others in their Itings, and pricking more fiercely; to that they have driren the Citizens out of the Towns by their stings. And Alian out of Antenor relates, that in the Mount Ida, the remainder of that race, dwell and make their combs. Such are also the Bees at Carthagena like to Muskitos. Pausania writes in Arricus, that Bees are so gentle in Halizamus, that they go forth to feed amongst men, and wander where they please, for they are flux up in no hives; wherefore they make their works every where, and that fo fast, that you cannot part the honey from the wax. They are smooth, shining, of variable colours, and not unlike 10 our good Bees. Lastly, since all Bees are by nature void of poyson, yet the place causeth the long Bees, and the distatte fashioned, about Carthagena in America, to make venomous honey; Mere they collect honey that is infected with the contagion of trees, winds, air, and earth it felf; and be it what it will be, they lay it up in their cellars. Also Bees subterrestrial have another Differences of formand nature. For those that work in hives and trees, are greater, longer, softer, better wing'd, the corporeal more yellow on their backs and bellies. But they that are under the earth build in little holes, form from the and are short compacted, with black heads and foresails, hairy almost on their whole body; a place. yellow down colour on their fides and rump, and that doth much adorn them. Of Bees, forme finde themselves houses in woods, some are received into houses made of straw or horn; some civil and well nurtured Bees, who will not refuse the care of the Bee-master who hath skill, but will much love and delight in it. The prince of Philosophers confounds the fex of Bees: but most bifference witers diffinguish it: some say the semales are the greater, and without stings; others say from their they are lefte and have stings. The sounder Philosophers, (whose opinion I follow) acknow-bex. lage no males but their chief leaders, which are more strong, greater, more able, and alwaies by at home for propagation, and feldome go forth but with the whole fwarm; whom nature subcommanded to be frequent in Venus occasions, and ordained them to fixy alwales at home

with their females o Experience wienefleth, that their do foster their young as birds do, very diwith their temates to Dapesterns what thrule forth their young Bees, when the membrane is broken ligantly, and it upon thems and thrule forth their young bees, when the membrane is broken. ligantly, and unipopulation and many the known by the babic of their body: for those that are new.
The differences and their Ages, are known by the babic of their body: for those that are new. The differences not rement organization wings a thole that sink year old, as allower my or the are new come forth; have mod thin and trembling wings a thole that sink year old, as allower my or three years old, are very bright meat; and are of the likenesse and to low of by!; but it leven year three years old, are very bright meat; and are of the likenesse and to one sell correlate. three years old are very originations and importmelle of nor can any, one cell certainly by their figure old they lay aide all tarnelle and importmelle of nor can any one cell certainly by their figure did they lay aside all farnetie and importances of nor can any employer terrainty by their home and quality of sheir akin and body (as it useth to be with borses) betweet they are. The elder of them, are hairy, hard, full of wrinkles, lean, rough to your fight; and feelings done harveling, and noted by a generable kinde of hoarinesse. And this was shewed to the Dutchesse, of Somethe when I was a youthounder whose chamber window above was the very same hive of Boss, that had when I was a youthounder whose chamber window above was the very same hive of Boss, that had when I was a youth under vivide entained transcer and of the fame, kinde. But as they appear been there 30 years, and this inflifies & liant relation of the fame, kinde. But as they appear been there 30 years, and thus planting the reft in industry, and experience, for years have taught more ugly in form, so are they before the reft in industry, and experience, for years have taught more ugly in form, to are they beare and practife; they know better how to gather and make them skill; and by length of time and practife; they know better how to gather and make Снар. Ц honey.

Of the Politick, Ethick, and Oeconomick virtues of Bees.

BEES are swayed by soverainty, not tyrauny, neither do they admit of a King properly so Bealled, by succession or by slot, but by due advice, and circumspect choice; and though they willingly submit to regall atthority; yet so, as they retain their liberty; became they still keep their Prerogative of Election; and when their King is once made. fure to them by oath, they do in a principal manner love him. He as he doth excell all the rest in portlines and seame of body (as is above faid) fo likewife (which is the chief thing in a Prince) in gentlenesse of behaviour. For although he hath a fting as others, yet he never wheth it to punish withall, infomuch that fome have thought that the King is without a fling. Fortheir law is the law of nature, not written but imprinted in their manners; and they are yet more gentle in pushing, because they have the greater power; and although they seem somewhat slow in reenging privare wrongs, yet fuffer they not the refractory and rebels to go unpunished, but wound and that them with their flings. So desirous they are of peace, that neither with wheir wills nor again, do they offer any annoyance. Who would not then utterly abhorre the Dionglas Tyrans in Sicily, Clearchus in Heraclea, Apollodorus the Cassandrian Robber? Who would not detel the villany of those close Paralites to Kings who affirm that Monarchy is no other, but the means how to accomplish or satisfie the will, and a device how to maintain lust? that which ought to be far from a vertuous Prince, lest white he would feem to be a man, he betray himself to be work then these little winged beasts.

And as their manner of life is not pedantick or according to the vulgar fort, so neither is their birth. For the royal Race is not begotten a little worm at the first, as the Bees are, but present-

And if he chance to finde amongs this young ones any one that is a fool, unhandsome, hairy of an angry disposition, ill shapen, or naturally ill conditioned, by the unanimous consent of the rest, he gives order to put him to death, lest his souldiery should be disordered, and his subjects be ing drawn into faction, should be destroyed. He sets down a way to the rest, gives order what they shall do, some commands to fetch water, others to make honey-combs within, to build them up, and garnish them; othersome to go and get in provision; those that are stricken in years he cherifneth at home, the younger he exerciseth in labour and vicissitude of imployments; and although he himself hath immunity from mechanick labour, yet as cause shall require, he also refuseth not to work; nor ever doth he go abroad but for healths sakedoriccestry. If he be by reason of age in health, he marches as General in the Vaneguard of his Army, and in person opposeth himself to all encounters; neither is he born by his attendint willingly, unlesse it be when he is soold and diseased that he cannot either go or fly. When his world with the control of the when he is soold and diseased that he cannot either go or fly. on the fignal being given by the Trumpeter, the common fort are commanded to their logging and the watch being let, every one betakes himself to his rest. As long as the King lives, all the swarm enjoyes peace, and all things are in quiet; for the Drones keep themsolves willingly in their own cells, the elder Bees are content with their own places, nor do the younger run out of their own into the elders lodgings. The King lives apart from the rest in a more minest and large makes. and large palace, with a waxen fence curiously made, compassed about as it were with a kind of wall. A little way from him dwell the Kings children, to whom if their father demoties but hald washe force (a character) and the kings children, to whom if their father demoties but hald washe force (a character) and the kings children, to whom if their father demoties but hald washe force (a character) and the kings children, to whom if their father demoties but have been seen as a second control of the characters. but hold up the finger (as they fay) they are hushtian to the said

But the King being dead, the subjects are perplexe, the Drones lay their young one in the Bees cells, and all things are out of order. Arifforde makes mention of more Kings or make Bees than one in a fwarm; which I hadrathen rerme Vice-royes or perty Kings; For as men as Antigonia tellifieth, the Swarm is in not leffe danger when it hath many Kings, as the it hath many Kings, as the it hath none at all. And so much be spoken of the good Kingri . The bad are more hairs and THOR II. word is dyn Historian and Historian will be not seen the bollow and seen and white word with the seen and the obleve gode nanch the common people larger and level in the control of the common and the control of the contro

Then Kings up two and person in person of the Kings in structure of the Train.

Biglis, as it more with golden spanses unrest of the Stings in standards summerty of the Train.

And gordening streeting scales, to took appearing to before the give the solve steer the conditions.

And gordening streeting scales, to took appearing to be set of the condition that can be set of the conditions.

And thus far of the Kings and Mobility How let us proceed to speak of the vulgar fort on Additing to the Bees, and to should all sounded squid stones their secures and commonater of the Bees, and to should stand and standard and standard

Bees are neither wilde nor came creatures, but a middle kinde of nature between both, but of all in a manner the most serviceable and most profitable. Their sling both keeps them alive and tilsthem; for if that be once loft, they cannot live, but being armed therewith, they guard the Swarm from all hossile invasion. There are none of them idle, although all do not, have not the skill to make honey meither do they which can do nothing as all, become like Drones: for they do not its they do froyl the combismor steal the honey. But they themselves are nourish by the flowers, and flying abroad with others feed together with them. Albeit also there are some amongst them have not the industry to make and store up honey, yet every one hath his work. and his art wherein he doth imploy himfelf. Some bear water to the King, and to fuch of the Bees that are spent with old age, and are decrepit,

The more ancient and graver fort of Bees are chosen to be of the Kings Life waard, or Esquires of the Kings Body; if they be any way in health, as being of known truft, and well feen in the tight ordering and managing of State-afficies, Orhers of them administer Physick, and undertake to care fach as are field, and of the Annife-flower, Safflon, and Violet, collect together, compounds and give them to drink, a most medicinable and cordial Honey. It any of them chance to die by reason of Age or beknesses forthwith the Bearers meet together, which carry forth the Corps of their shoulders at on a Reer, our of doors; less they should any way pollure or defile their clean and near Hives with any uncleanne fley filth on putrefactions years

Neither are the Bees, without their tommanders, Captains, Liegronants, Trained-bands, Cond ners, Trumpeters, Fifes, Scoutmafters, Warchmen, and Souldings an Army which do (as if it were a little City) guard and defend their Honey: and do in condign manner punish and corment the Dors that fly thit heegend. Worms that undermine when went upon reduping to the second

Left they frould be taken for Drones, as they fly they make a buzzing or humming noise, which according as they begin to fly of cease, is heard or not heard anyhigh found whether in proceed from theirmouth, or from the motion of their wings, Ariftate and Beirbin ido much contend about Neither was I beenfor entirely fighted, as to decermine of a marres to exceeding intriduce and obfaute; But the Fifes, and Corners, feemless make that found or noise which Hofschine calls Cimmi the English call it finging and that they make their figure or warch word when they are to witch y a call as feeth his beets and his cell, god what dreen dreig or reshwages anoth

So greatis their take of prederring their Wingschaulthey Anter him how to go abroad along but gathering close robother combotheridas, their combany, peing mixided, they hem hittin and gland him as he goes along of the continue in their south by the King that a vander out of the ways of fall begone out of cights being their by their south of thomas, weather then all make tearch after him, and do follow him by the fent as it were, till they know certainly what is become of him. And if his bety red with flying, or tediousnesses of weathers the company bearing him up with strength of their wings as it were in a Charjan convey thirty Home. If he dres all of cheris. soltheir waiers por if they chance of day forme time there, they make only combs, but no Honey and within a while aftery ibeing altogether idles full of dissien offered; wall owing at last in their own filth, they miferably end their lives.

CHAP. III.

and it is the engine of the Of the Creation, Generation, and Propagation of Bees.

Orafmuch as Philosophers have given our that Bees (for the first fin of mankinde) are begot- Creation. ren of purefaction; there are not wanting those that deny they were created in the surface of the world: I leave the question whose to be deregnized by others; although tome pivines, especially Dubravian and Danam do abundantly aftern that they were created with the

Of the first Generation of Bees Aristotle hath a long discourse. The Philosophers following Generation. him have rightly determined in my opinion, that their Generation doth proceed from the cormption of lome other body; as of a Bull, Oxe, Cow, Calf, very excellent and profitable healts: the which not only worthy men and without all exception do report; but even rufticals and common experience doth confirm. They fay that out of the brains of these beatts are bred the Kings and Nobility, and of their flesh the common fort of ordinary Bees. There are likewife Kings that are bred out of the marrow of the chine-bone, but then those that come of the brains do far excell the other in feature or comlinelle, in largenelle, in prudence, and in thrength of body. Now the first transformation of this flesh into these Creatures as it were by a kinds of body. ANOW the initial content of this field into their Creatures as it were by a kines of conception you hall then perceive to be when as these little imperfect creatures appear in great numbers about the Oxe, Lion, &c. in a small white hew, and as yet without motion; but increasing by degrees, and their wings by little and little growing out, they come to their proper colour, flying to and hove ting about their King or Master-Bee; but yet with short wings and trembling as unacculiomed to flight, and by reason of the weaknesse of their limbs. Now what counteys do most conduce to the generation of the weather or them must harried to them, we shall afterward bandle. When we come to treat of Hopey. But in general there are very few places in the world to be found, (unlesse in the world to be found, (unlesse in the world to be found, (unlesse in a very barren countrey, and unwholsome air, and where no food fit for them can be had) in which Bees cannot breed and very well live. But where there is perpetual frost and snow (as in Scanzia) or where the country is barren of herbs and trees, (as in Thule) there they are neither able to breed nor live. As also for the poilonous condition of the airs and nature of the foil some fort of Bees do not endure to live there, as in the Me of Myonner it is reported, that if Bees be carried thither (if Allan be to believed) they presently dys. But whereas Munster saith of Ireland, and Solimus of Great Bris tain, that those Countreys are altogether without, and that they cannot live there, if they had not spokerather by hearfay, then of their own knowledge, they would have written that every village of town almost is full of them. And thus much may suffice to have spoken of the Generation of Bees, come we now to their Propagition; concerning which Authors have di-

Some, faythey, never couple, or bring forth, because no man ever yet saw or could tell whe-Propagation. ther they did to or no. Others fay, that when they have shed their seed upon the flowe s or leaves of trees, they carry it to their Hives, by diligent and fost string upon it, it comes to perfection. Pliny will have it gathered from the Hower of the Honey-suckle, or Honey-wort. Aristole from the slower Calander, so called , Athenau of the Reed-slower, some of the slower or berry of the Olive; taking that for an argument, that in those years wherein these slowers are most plenty, there are great store of swarms of Bees; but when there is scarcity, then few or none are to be seen: when as yet they do nor consider or observe that even in very cold countreys where some of these flowers grow, nor are to much as seen, there are plenty of Bees. I am of opimonthat they are propagated by copulation, and am confident the male Bee is the greater, the semale the lesse, who whether as Cocks do tread their Hens, to they accordingly engender, lee experience teach: yet certain it is, that the lessor Bees only, to wit, the females do set upon the egges, and the shells being broken (after the manner of Hens) they do by an admitable and natural midwifery put forth their young.

Arifole on the contrary affirms, that the Kings or Master-Bees themselves do first bring forth, and afterwards all the relt; as those also do the Drones, but the Drones beget nothing, and so their generation ceaseth. And this it may be, not without some reason, in regard that the Kings or Miller-Bees alwaies remain within, as if they were ordained by nature only for procreation, neither ever appear abroad but when together with the whole Swarm they go to some other place to dwell. For the fame reason also they are so extremely beloved of all the Bees, and live exempted from all necessary busnesse and labour. These do also excell the other Bees both in bulk of body and frength, as if their bodies were by nature made only for breeders, Bushegreaten Diones keep a mean between both, and hold such a loving correspondence with the labouring Bee, as that they may nourish both the Drones their Nepheros, and the Kings their Parents. But as for that which the Philosopher addes, that Bees do not engender by way of copulation, because their young is so small, the same argument my be held of the Flies, of which some are bigger than Bees, who lay lesse worms, the which growing by little and little become like Bees without wings, and afterwards become Plyes.

There are that affirm that the Drones do matte Combs in the fame Hive With the Bees, but There are that amount that the Drens to Thank the Bees, but cannot make any Honey scall; whether it be by reason of unwieldinesie; or co-pulency of their cannot make any Honey scall; whether it be by reason of unwieldinesie; or co-pulency of their cannot make any money stall a whether the first if their Combs begin by reason of the weight bodies or their material indication of the weight bodies or their natural indication in the weight of the Honey to fagor to be ready to fall they raise them up and under prop them with arched Of the Honey to Inogor to be ready to tailsting, rate them there must of necessity be a ready partials, that they may go under them, for to every Comb there must of necessity be a ready partials, that they may execute their several offices which are appointed them. In tome thee) land whereby they may execute their rake white Honey in trees without any Hives at places as in Pontal and the City Aniform they make white Honey in trees without any Hives at places on Ponens and the City Anglements of beyond all humans. Others there are who think that Boes do spring from the Honey, or with the Honey, or at least of the most pure and excellent part of it: and that without all putrefaction. But yet something whatfoever it be, ferving to engender, and out of which Bees are engendred, without doubt it

yed in the cells. Soaliger thinks they lay Eggs, although the Bee-masters, with one consent, say that they lay

little Worms, not Eggs.

Taxtes is of opinion, that they do couple, and determines the Bees to be the males, the Kings the females; and that the Kings at a certain time do put forth little Worms all about the Hives, as the Flyes do, and the Drones fir upon them as the Screent uleth to do, and by firting upon them for such a time doth cherish them. Then afterwards these little Worms called in upon them for their a cline doth the purely, as it were with a mixture of wine and honey together, Oreck 2016, are fed with the purely, as it were with a mixture of wine and honey together, till at length they grow to be Nymphs, i.e. little Bees, but Without Wings; and then being wrapped up like to Aurelia, they lye fill in the cells, feither taking any food or making any excrement. Till at length by fish a day the field wherein they lay being broken out come the Bees; and address the Bees are much delighted with wings being not yet fully grown. All this time the Bees are much delighted with urine especially of men, and therefore do frequent those places which are were with it, bit especially af-

· Confervation.

To the Conservation or keeping of Bees, many things are required to wir, orderly dier, dink, sleep, watching air, exercitation, habitation, convenience of place, as also moderation of minde. and physick fit to cure their Diseases; of which we shall speak in particular. As touching their provision, they seek for nothing, but they themselves being mindeful of the approaching winter, they take pains for in fummer, and what they get store up accordingly. For they gather and cook or drelle their dier themselves, the prime or chief whereof is Honey, which being over nearly drawn from them, they become gaunt, and lank, and gransparent, that you may see through their bodies and unlefte there be other means made to fulfails their hunger, they all dye for want of food. They have also other meat to preserve themselves withall, as Wan-wor, Honey-wort, Bees-meat called Sandaracha; but this is the worft, and taftes sweet like a fig: when these fail, the Bee masters lay before their doors, figs, sugar, dried railins, the drones builed, the heads of gentles, wool wet in fod or fweet wine, and also honey-water, lest they should faint and dye for hunger. Pliny would have raw flesh, if it be sweet and fresh, to be laid for them to feed upon. Ge-

recally all sweet things and of pleasant smell they covet, though at a great distance, not so much for the smells sake, but as being their natural food, as Flies seed upon wine. No odoife rous and fragrant slowers do they refuse; from whence they are in the Latine called Florings. in the Greek, detallame, detallies, from the delight they take in them, and their greedinesse in

The Plants most acceptable to Bees, are the white and red Thyme, Melicor, the Myrile, the Willow, the Broom, Lavander, Beans, wilde Thyme, Violets, Kexes, Rosemary, sweet Cleana, Almonds, Heath, the Tamarisk, the Cytifus, Calia, Daffodil, Afphodil, but Chieffy Balin concerning which Macer fang these macilent verses:

> That herb the Greeks call Balm, the Bees approve, And above other plants do highly love; No flower or plant doth please them half so much.

Also the Jvy, black Hellebore, Origanum, Savoury, wilde Violets, sweet Marjoram, the Hyacynth, the Palm-tree, the wilde Olive-tree, the Flower-de-luce, Saffron, Rose, Lilly, the Juniper-tree, Pear-tree, Peach-tree, Turpentine, Mastick, Cedar, Tiel-tree, the smaller Oak, goldylocks, wilde Saffron, Cumila, flowers of Multard, French Spondilium, Crowfoot, purging Thom, all trees that bear Maft, Apple-trees which have no birternesse in their blossoms; moreover they feed greedily on the llowers of dead Nettles both white and yellow, whereupon this herb by the Helvetians is called (Bienfauge) as if you would say, sucked by Bees.

As for their drink, if there be but a river or running water hard by in which there are flones, or pieces of wood cast (upon which they may light conveniently, and bath or washthemselves) they go no farther to drink, if there be none, they fetch their draught other where and quench their thirft, and when they have done, they carry of the same liquor to their King or Master-Bee,

and to those that are at work within (as hathbeen said before).

Whatfoever they eat or drink, must be undefiled, pure, sweet, and without any stench or pur

trefaction whatfoever.

Yea, to cleanly do they live, that if a mentruous woman come near them; they are reported to forfake their food and feed no longer, as also those that use sweet oyls or persunes about their bodies, and those that are given to overmuch lechery they hate above measure, and can by no means endure: also all things that smell of oyl or smoke, and dung and durt, they are hurtful herbs, all that have any bitter, purgative, unpleasant or poylonous quality in them; they to hear Warmwood. Phala all the purgative any bear warmwood. fo. bear Wormwood, Rhubarb, Senna, Savin, Tithymals, Hellebore, Wood-laurel, Coccus guir

dius, Thapsia, wilde Cucumers, Yew, Rhododendros, Wolfs-bane, they will not once talle of.

When they have laboured hard all the day, and come home weary, a certain fignal or token being given, (as is above mentioned) they take their rest. The which oftentimes is many waies dishubed and hindred, and by this means the Swarm being aftonished and over wak'd do die: sometimes the Gad-bee or Horse-fly molests them, sometimes the Bear making a noise wakes them, sometimes the approach of the enemy affrighteth them, viz, the Lizzard, Spider, or the land Toad; in which regard the Cornet prefently founds an alarm, and calls them all forth to arms in the night. If it happen to thunder or lighten by night, they are all prefently in an uproar or turnult as if there should be a mutiny in the Army, or some fatal battel to be fought. And the reason of it, is in regard of the unwontednesse of the light at such a time, as also because they are afraid, and that not without cause, lest their Hives being shaken, the combs should be disordered and displaced, or their little waxen vessels being melted, the Honey should ren out. That this is true by experience, no man can better speak then Dr. Penny and my self, who in the moneth of August 1586, whilest we sare up and watched by the Countelle of Somerfee then a widow lying dangeroufly fick, together with her two noble Daughters Mary and Elizabeth, on a sudden (after a great clap of Thunder) under the next ceiling between the joylis, we heard a great noise, as it had been an alarm of war, and as we thought the floor did relound with the noise; being altogether ignorant of that (which indeed was the matter) that Bees did harbour between the rafters and the ceiling; where it feems they had remained for 30 years together, and every year to have yeelded two or three Swarms, as we understood afterwards by those which were eye witnesses of the same, and they of the chief Nobility, who affirmed it to be for certain. The next day for want of sleep they slew about making a hoarse noise, trembling, and not knowing what they did; they did touch those things which naturally they tould not endure, they did dash themselves poor creatures against the windows, they did not fone to fling their friends and those that looked to them, even to the admiration of all that flood by and observed them. From whence we conclude without all coubt; that Bees are most patient of labour in the day time, but most impatient of being scared in the night, and of being disturbed of their rest.

From whence they seem to have gained the name or Epithet of Solifeque, or Sun-followers, for with it they rife, and with it they rest. None of them take so much as a wink of sleep all

the day long, and all of them in the night fleep very foundly.

Now their exercise is of two forts, either they fly abroad for their pleasure, or tarry at home Exercise of and work for necessity. If that be denied them (the Crocodile, Swallow, Lizzard, Spider, or Bess. other strange Bees intercepting them) either by reason of intemperate weather, or long rain they become purfie, unwieldy and nummed in their limbs, grow into diferfes, and shortly after die, especially in the summer leason, which is the only time they have to exercise themselves about in the open air. When they have refreshed themselves with slying about, then they bath and wash themselves clean, and afterwards they lightly rub themselves smooth with leaves. Moreover also sometimes they carry littlestones, sometimes they carry water, and as little things asthey are, will break through the wind though it fit against them; and they will in a bravado, yeathey will venture their very lives also to fight with the greatest of beasts; Horses, Elephants, Dogs, you and Men too (Archilochus was of this opinion) if they offend them and quarrel with them they wound, and with their stings often and fiercely thrust into their bodies, they kill them. Sometimes they appoint duels one with another, not in earnest, but in jest, for exercise and recreation, not with any intent to hurt one another. They will play together oftentimes, and tickle one another, and like Doves bill and kisse each other, after which without doubt they couple together also, but at what time after, in what place, after what manner, let that all-eyed Argustell, who alone fits by the Elephants and knowes when they engender, which no man ever yet faw but God.

Nowas they perform the aforesaid exercises of slying, of fencing, of carrying of stones, &c. for their recreation, so necessity the mistresse of Arts hath inured them to domestick labour, to which they diligently, not lazily apply themselves, no day (if the weather let not) is spent idly; but how long they work, that wholly depends upon the constitution of the Climate, or the air, for in cold Countreys from the setting of the Pleiades or seven-stars, to the Vernal or spring Equinoctial (or thereabout) they keep close within their Hives; but like Dormice without food, seeping, and so they continue rouled up together like a ball, in a heap; nor do they stir a jot from the place where they are: for else how should such little creatures as they, be able to endure frost and snow, and the bleak gusts of the north wind? But if the temper of the year be more warm, and so continue for a great while together, 'tis longer ere they leave their work, and that fishiopia proves by manifest experience, where through continual heat, and almost no cold that is there, the Bees work almost all the year long.

Burin Europe they feldom go abroad before the beans begin to bloom or bloflom, (as Pliny Wineffeth) which they taste of the first of all flowers or herbs whatsoever. Servine dreams that then winter drawes on, they flop their mouths with juice and flowers, and with these keeping their Hive to sustain themsolves. But in summer they never loyter at all, but exercise themfores in constant employment; and when they have gotten such a numerous off-spring that one

Drink.

house will not hold them, in the moneth of May they make a solemn expedition, and divide house will not note them, in the moneth of Araba to themselves into several Swarms hanging upon the boughs of trees like bunches of Grapes. The elder Bees afterwards making two or three rounds or circles in the air go to their food and return elder Bees atterwards making two of the clony thus fent forth and left, unleile they be entertained their Hives: the young imarm or colony thus fent forth and left, unleile they be entertained the middle of the colony that the middle of the problem. to their Hives: the young main of colony the woods, untill the publick overfeers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods, untill the publick overseers and hospined with fresh Hives, wander up and down the woods are the woods and the woods are the woods are the woods are the woods are the woods and the woods are the woo tary Bees have found a fit place for the Swarm to fettle in.

Now having spoken of their exercise, in the next place let us enter upon the description of Now having spoken or their exercise, in the spoke call suppose the description of the places or houses where they are to reside, which the Greeks call suppose, or The

Latines, Alvus, Alveus, Alvearium, &c.

Now about these for the conservation of the Bees, three things are requisite or needfull. The fashion or form, preparation, position, and the fitnesse of the place where they are to be fet. The best receptacles for them, are made with barks, but especially with cork, which in the heat of Summer doth not scorch them, and in the Winter is very good to keep out the the neat of Summer doubles to make them of an hollow tree, or of boards artificially cold. The Ancients were wont to make them of an hollow tree, or of boards artificially joyned together, also they were used to be very handsomely made of Reeds, or of the Holmjoyned together, and they were the trouble of earth are counted the worst of all, as also those tree wreathed or twisted together. Those of earth are counted the worst of all, as also those that are made of Brick, or Clay, because in Summer they are over hot, and in Winter as exthat are made of Biles, of Clay, the have certain thick pots or vellels to hang up treme cold. And yet (as I hear) in Hungary they have certain thick pots or vellels to hang up from the ground, and these they hang up in Trees, for the Bees to make their Combs in; which when they have done, they at a certain time take away again. Some make them of Mud or dirt, but these likewise have their inconveniences and discommodities.

The English use to enclose them in Hives artificially wrought and built of straw; that in Winter they should not be starved, nor in the Summer sweltered with heat. The Ancients wee wont to make them of a kinde of transparent Stone, of Horn, and Glasse, to the intent that they might look in upon them and see how they wrought. But the Bees lay a first, second, and third covering over their work withinfide (as I faid before) whence they perceived they lost their cost and labour in that contrivance, as being never the near by that way to gain their

Let the form of the Hives be after the manner of an Egge, the yolk and the white leing clian

taken out, as when we eat it, a little of the end being pared off. Moreover the Hives ought to confilt of twelve rounds or wreaths of straw woven together

The 3 first lowermost must be of one size or bignesse, a foot and a half in breadth: The 4 next above them are to be a little bigger and more capacious, that the combs may be the better fastened, and may hang more steady: The other 5 circles or rounds are to be narrowed and made steep up to the top by degrees, in the likenesse of a spire or pyramide; but the whole Hive ought to be of that content and bignesse that it may contain in it in all about 20 /. weight. Let the mouthes or passages into the Hives (by which the Bees are to go out and in) be about three or four; and no bigger than that the Bees when laden with Honey may well go in; for by this means, the Lizzard, or Beetle, venemous Spider, Moths, using to rob their Hives, are barred of their entrance; and the Hive will not be so obnoxious to frost, and the extension ties of the winter season. Above these they use to make 4 doors, also windows to slut down with bolts, 2 before, and 2 behinde, that they may the better take out the Combs, with lesse disturbance to the Bees in their making Honey.

The preparation or feafoning of the Hive after it is made, is reported to be divers. The English do take in new Swarms into new Hives, without perfuming or anointing them at all. The Ancients after they had made them very clean, did use to rub them all over within with Balm, Thyme, Fennel; and did sprinkle them with some sweet thing made of honey sugged, or with sweet wine or metheglin, that so they might the more willingly come into them, and the longer remain in them. Palladius was Wont to anoint the infides of the Hive with the dung of the first calf that the Cow hath; and this he accounted for a chief secret to retain Bees in the Hive. Moreover it is requilite that about the midst of the Hive there should three or four Ricks be laid a crosse to hold up the Combs; and then they are not subject with any light shaking of them to fall down; and are more easily if need be, taken away. Take heed also there be no chindren of the best are the there be no chindren as a second of the best are the second of the sec chinks or clifts in them, whereby they may be annoyed with heat, cold, dust, remine, the

Placing of the As for the Placing or fetting of Bees, it is convenient that the Hives should be mounted on Bees. forms, orthools, that they be not dirty or mouldy with standing on the ground, and that they may live more secure from noxious and hurtful beasts. Let their standings be made of stones and chapite also are chapite also and chapite also are chapite also chaulk, elm, or oak; three foot high, covered over with flattile, or pargeting, or whitelime, and that very smooth and sleek, that those Honey and Bee-devouring creatures may not be able to climb up. Let them also be set shelving or casting forwards, lest the rain-water setting upon them should said the sain-water setting upon them should said the sain-water setting upon them should soak and wooze into their Hives: for which cause (as Golumella witnesseth) they were worsten be placed into their Hives: were wont to be placed in hollowed walls or porches of Cities. Let there be two handfuls difference herween engaged in hollowed walls or porches of Cities. flance between every Hive, that one shogging or shaking, the next may shand unmoved, as it is unfinal when they are for the same and the same shand unmoved, as it is usual when they are set close together.

Now as for their Ranks or rowes how many they should be; they are not to be above three

at the most; of which, let the younger, Bees have sheifirs, the second fort or middle aged; the middlemost, and the elder Bess, the highest or uppermost place. But yet both the Hives and the forms whereon they are let must be conveniently placed for the benefit and advantage of the Swarm; in hot Gountreys, towards the North; in cold, towards the Sauth; yea in Ethiship by reason of the excelline hear, and scorehing of the Sun, they keep them in their houses, a fufficient gap; being, made in the wall for them to go in and out at; left their combs should be melted. Let the place where they are be opens not over hot in Summers nor very cold in Winter, quiet from wind, not woody, not inclosed with an over high wall or pale not against a place where any eccho is given planted with natural and ordinary foods remote from the company of men or cattel which may crop or shake off the dew from the flowers; near no jakes, privy-houses, dung-hils, common-shores, standing ponds, bogs, gallows or place of execution, Church-yards, or where bodies use to be buried; and so ordered that it may be in the bottome of a hill or in a valley, to the intent the Bees being laden may with greater ease fly down to their Hives. To conclude, if there be a wind above other that doth infest any counnow, in that, let the Hives be placed where they may suffer the least harm, and in no wise let them have any doors open against it. But this diet is necessary for the tame Bees for to maintain their lives; now as for the wilde and wood Bees, they live after mother manner, they chuse their places of residence themselves, and furnish them accordingly. In the Countrey of the Abiffines under Prefter John, the Bees live in the Tradesmens houses, and flying up and down amongst them without fear, hang up their Combs, their hives being made fast to the beams or iovees of the same, without any harm at all to those that work in the place. Moreover in many plices in England they have been known to have taken up their, harbour of their own accord, and that for a long time together between the rafters and the ceiling of houses, and in the hollow trimks of trees, and from thence the old Bees have fent forth three or four swarms of young ones in one year. And (what is worthy to be noted) they live here longer and more happily, then in their artificial woven Hives, with fo great diligence perfumed, so curiously set, ordered, digested and placed. But yet I commend their industry who have freed the Bees from this trouble, and have no leffe ingeniously built them houses to keep them from wind and weather. But they above all the rest deserve commendation who have found out how to cure the diseases of their bodies and mindes, inward and outward, and have had the skill how to apply them accordingly. The pallions or distempers of their mindes with which they are most troubled, are Anger, Grief, and Fear, For they very hardly digest injuries, and they betray a great deal of tholer and spleen to be in them, by their often fighting, even amongst themselves. For if they over abound with issue, they are all in an uproar about their cells and lodgings, nor can the quarrel be composed, till many are flain on either party; or being divided into faction, they do of their own accord leak other places of habitation. More then this, even the fouldiers of the same Colony, when they (for some private grudge or jealouse fall into a rage) they make war, and fall foul one upon the other: the which the wary Bee-master etpying, and catting in dust or cold water by squirts in at the vent holes, where they go in and out, or making a terrible and hoarse noise with the palms of his hands, doth before it be too late pacifie. For if he should let them fight on, they would be so mad and cruel one against the other, that they would never be quiet till they were all killed.

Samelle and Melancholy also doth very much distemper and disturb them, arising sometimes from the death of the King or Master Bee, sometimes of their young ones, sometimes of their keeper; neither will a day cease their conceived sorrow, but they take it to heart, that their bodies pine away, and it consumes them to skin and bone. Neither will the tinging or tinkling of the braffe pan, or any harmony whatfoever delight them (which yet when they are mad, and dote so that they know not what they do, is wont to cure them) there is no plague or disease that

can be named, that is more deadly to them than this.

CHAP. III.

They most stand in fear of the Spider, Lizzard, Crocodile, Toad, Glow-worm, Gad-bee, Wasp, Fear Homes, the multitude of Dors or Drones, a little bird called a Houp, the Titmoufe, Swallow, the Woodpecker or Eat-bee, the Owle, and other the like destroyers and spoilers of the Hives. They are likewise very searful of an Eccho, thunder and lightning, and the like sudden crackling noise; as on the contrary with a fost still whistling, or murmuring noise, and tinkling of brasse they are accedingly taken and delighted. When sear takes hold on them, poor creatures, they wander up and down they know not whither, and when they go out or in to their Hives, they feem to be giddy, as if they had a Vertigo in their healing whirling and turning round; as for their Honey, or their young ones, or for thole that are lick, they fearce regard them; and never leave trembling and quaking in their wings and shanks. The Bee-master therefore (when their provision fails) ought to debrow the Morross and them ought to deliroy the Drones, and (by putting raw, flesh into a pot) to take the Homets, and then builten. To kill the Frogs, Butterflyes, Wood-worms, and Canker-worms, to wipe away sheir webs, to entrap the Gnats and Flyes, to stab through the Lizzard, Crocodile, black sly or Beetle, and by putting in a Candle (to which they will come of their own accord) to burn the Goldwworms or Moths; to chate the Frogs and hunt them from the standing waters and senny places, to thow down all the pests of Swallowes. Modwals, Owls, or Wood-neckers (especially in all the throwdown all the nests of Swallowes, Modwals, Owls, or Wood-peckers (especially in all the neighbourhood or places hard by them) to destroy the Muskin or Titmouse; and to desend them Stink all other beatts that lie in wait for them, and all other strange Swarmes. In which fight

the Bees do as it were acknowledge their keepers who after the victory isluing forth fer upon the vanquish dtroops, but to their defender or; champion offer not the least harm.

The Bees by cheek means thus quitted of their fears, only with the tinkling of the Pan, and The Bees by cheek means thus quitted of their fears, only with the tinkling of the Pan, and formetimes with the Bee matters voice only; are frengthened and brought to themselves again, and every one chearfully returns to his several appointed imployment as before. Some Bees and overy one chearfully returns to his several appointed imployment as before. Some Bees and over care at all for coming home to their own habitations: this ill habit and hauns, the Bee-matters with clapping of their hands, and with habitations: this ill habit and hauns, the Bee-matters with clapping of their hands, and with the found of the braffs (in which Bees are said environmently to delight) do presently remedy; although it is yet uncertain whicher they do hear the sound, and are led by the pleasure of it; or whether or no rather being affrighted and terrified with the trembling and reverberation of the air (as when thinders) they return to vitels Hives; and I see no reason why Pliny and Niphus should have make a doubt. Others lest the swarm should fly away and so be gone, do Niphus should have make a doubt. Others lest the swarm should fly away and so be gone, do crop off half the wings of the King or Master-Bee. As also others do besines or dawb the vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved. Moreover if you strew vent holes out of which they come, with the dung of a cast newly calved.

Smear but their Hives with Balm and they'l abide, And much the rather if that milk beside, Be us'd to keep them, that they wander not.

Pliny faith, if some of the dust over which the serpent hath gone, be cast upon the Bees, they will return to their Hives. Others yet advise to sow Goldilocks near where they are, as if they delighted most in that slower above all others, and would never for sake those places where these slowers abound. And Authors report that the wilde Bee is allured and tamed therewith.

Difes es of Bres nd the cures,

002

The bodies of Bees likewise are subject to divers diseases, viz. repletion, inanition, drowth, moistnesse, cold, and unnatural heat. Repletion, or abounding of humours is caused when the Bee-master neglects to gather the Honey in good time; for then they do so fill and gone themselves, till being grown over with scab and scurf, and swoln in their throats, they become fickly; there follows upon these sluggishmeste, feavers, longings, loathing of their food, warding or wakefulnefle; with which the miferable poor outworn Bees, unteffe they have fome timely remedy, do die; wherefore of necessity they must have their Honey gathered from them. In doing of which two things are to be observed, viz. the time when, and the quantity how much, the which according to the quality and cultom of Countreys, are divers. For in England they gather the Honey every year, wie, either in the latter end of July or in the beginning of Ar-In hotter Countreys they observe three times in the year to gather in this Honey havely viz. at the rifing of the Pleiades, when their are at they Zenith or Vertical point, and prefently after their fetting. Didymus in his Geoponicks, writes that this time of the Plade is the bell. The Romans did use to unbowel their Hives, the first time in the moneth of May, and then again when Summer was almost done, and thirdly about the Ides of Ottober. From whence it was called Spring Honey, Summer Honey, Autumnal Honey, or Honey gathered in Anuma. Anifalt advireth the first taking Honey, to be when the wilde Fig-tree begins to be green; the second hecommends to be done about Autumn. Generally it is very necessary that the Honey should be the whole the second here with the second here with the second here. be taken when the Hives do over abound with Honey; the which is certainly underflood by the shrill or squaaking noise that the Bees make. For if they be empty, they give our a more clear and loud found, as being more full of air then meit: but most certainly it is known by looking in at those doors placed on both sides of the Hive, being open (saith Columella) of which we have made mention before in the building or structure of the Hives.

The manner of taking them is thus; Betimes in the morning while they are hilf also and drowie, is the time when the work is to be affected, and their Combs taken away; it being not convenient to exasperate them in the heat of the day. Columna prescribes for his intention instruments of a soot and an half long and somewhat longer; the one must be sold his with a broad edge on both sides, but dull, with a crooked head and sharp teeth to rate on the Combs withall, the other plain with two sharp edges; to cut down the Combs. With these the vessel being opened, the businesse will very well be effected. In Bagland as also in other Combt eys, viz. In Helvelia, Germany, and the Low Countre's; they do not set up in them with these two instruments, but with sire, and smoak, and water, with which they chase the elder Best from Hive and keep the Swarm emire at their pleasures.

raye and keep the Swarm entire at their pleasure.

Moreover intaking away the Combs, there ought a mean to be observed, according to the great state of the Swarm and number of Bees. For with overmuch plenty of Honey they gon to the additional their Masters and themselves, for which the abound with stoney the feed not on Bee-bread, burglut themselves with the very practit of the Honey: on the other the feed not on Bee-bread, burglut themselves with the very practit of the Honey: on the other the feed on, languishing for want of sufference by grow keartlesse, and live carelessy; and becoming to thin that you may see through them being starved and feeble, they milestally perish.

Moreover, the old and rotten Combs ought to be taken away (but not those wherein posserity is concerned) and those which are whole, and which contain the young spawn or stry of the Bees, unless you see that there is not so much Honey lest as may serve for the suffernation of the Parents or elder Bees. Keep such a proportion, that in the abundance of Honey you take two parts and leave a third; if there be but indifferent stores take the half, if the Combs be in a manner empty, take nothing at all out of them. But this proportion is not be observed in all places, because in regard of multitude of slowers, store of pasture, and goodnesse of it, together with the condition of the Countrey, you may take away more or lesse as you shall see cause. For in Ferbiopia, Syria, and Palessine, they commonly take all the Honey out of Hives: which by reason of the fatnesse of the pasture, and continual dews, are filled again in very sew daies.

But if there chance to be famine and scarcity, you must not only drein the Hives, but take away part of the Bees also; and choke the greater part of them, with the smoke of Tow, Reed, Turpentine, or Brimstone, or Galbanum, or else drown them in water; by which means the hos-

ney will become sweeter and purer.

CHAP. III.

Famine is caused especially two manner of waies; either by scarcity of provision, or the badnesse of it by reason of corruption: when there is great want you should supply them with Honey, sprinkle them with a liquor made of wine and honey boyled together, give grapes or figs bruited or pounded together, and fugar-fops. Plany Would have Hens fielh given to them, although he faith that Bees will not touch any flesh whatsoever. Now the corruption and unfoundnesse of this meat, doth procure first of all, longings, scowrings, barrennesse, and consumptions; from whence and by the stench of dung and dead corpses, ill sayours, plague and putrefaction, with other dyfasters do arife. In their longing desire of what they fancy, they grow so nice and peevifh, that diffiking all things, they are ready to fly away, unless with the perfume or vapour of things of a very pleasant and grateful odour, with exquisite playing upon the braste pan, and exceeding neat handling of them, they be retained. Also they are taken with a lask of loomesse in their bellies, both in regard of the naughtinesse of the juice it self, as also in regard they feed on those herbs and leaves that are purgative, as Hellebore, Spurge, both kinds of Elder. For being greedy of food after their fasting all the Winter, astoon as the Spring comes, talling more greedily, than in way to their health, every herb that they light on, without putting any difference, having gathered unwholfome honey, they are taken with a cacochymia or ill humour or hibit of body, and afterwards very fuddenly fall into that lisk or loofnesse, afore spoken of

Against this disease (saith Pliny) set them services with honey, or wet with man or oxe pille. Also Pomegranat kernels moystened with wine of wilde Briony; Pallading much commends the kernels of Pomegranates or Raisins boyled and pilled, with Manna or sharp wine set before them in wooden gutters; also he bids squirt in Honey boyled in water, with the powder of Galls, dried

Roses, or Rosemary, or set it in with little sawcers.

Moreover, care is to be had, that they do not bring home any food gathered in the woods, wherefor the most part do grow harsh and sowre herbs, with the acrimony thereof the bellies of the Bees are moved, and are scarce stayed but by the experience and accurate enderour of their keeper. From thence proceeds barrennesse, because by that means for want of seed they do not generate, or at least (by reason of seeblenesse) they are not able to hatch their young, or constantly to sir upon them, or to avoid the shares of the Spiders which are drawn over the mouthes of their cells. This consumption and heetick feaver increasing yet more and more, Highne bids that sowers be brought, soaked in dew or a sweet liquor made of wine and honey, and so layed anto the holes or years of the Hive. Also he commends for that purpose Violers and Biglosse showers beforinkled with new wine boyled half away, after that their Hives being very well cleansed, and the vermine and dead Bees rid out of them, they are to be persumed with oxe or cases dung; because that takes away purrefaction and infection, and doth instill a new life or soul (if Columella say true) into the almost expiring Bees. They are also full of lice (as Florentius relates) the which he cures with the sharings of the Pomegranate and wilde Fig-tree burnt to almost. The same Authors cure the dushesse of the Pomegranate and wilde Fig-tree burnt to almost. The same Authors cure the dushesse or published the feur and dandis, with a gentle rubbing of their bodies against the herb Celandine, and against walls stained with mine; their drinnesse cure with backet, and their throat with drinking mineral water.

The diseases that come of moisture, are swellings in the neck, tumors in the head, dropses, which the Ancients used to care with dry herbs, and shaking off the dew from them bettines in the moming, and our countrey people do somewhat abate it, by keeping them from common water, for they keep them three daies together in their Hives, by which it comes to passe that not only the superfluity of the bad humour is dried up, but the natural moisture is in some measure tegraned. Hespelium writes of a disease very common to Bees, which he calls Kdzen, but what is the doth not tell us, neither could I learn from any other Author, what, or what manner of disease it should be.

The difeases proceeding of cold are congelation, nummediatelle, stiffnesse, and other of that fore, you hall see them sometime so numned and stiff with cold, that you would not think they had the least motion, much lesse breach.

On the other side, through extremity of hear, they H h h h 4

CHAP. IV.

are driven into madrieste, excessed of thirst, Feavers, Vertigo, and swimming in their heads, yea they grow stark mad; at which time they know no statisho not their keepers, and will strike their stiends with somewhat venomed stings. In such fort therefore ought their Hives to be placed in both seasons of the year, that in the winter they be not, too much opposited with cold; and in the stands of the statish of the street do not keep the heat from time. Bees do fail also some times for want of thise, as in the plency of passibility in happens to come to pass; at which time they are so intend their work in making of Floney, that the case of copulation and propagation is quite said aside; and it of he reparation of issue being omitted, the whole Swam being spent with labour, is extinguished. But when they say a strong and any propagation of their Hives being not kept tweet; of for some pellitient disease that reigns amongst them; you must follow after them, and with that Art (Palladius hath taught) being sound again, entertain them is clean Hives, and remove them from the place where they were before into fresh divellings. Moreover, Plini saich it doth very much conduce to the keeping of Bees, that they see little given or bought, for if they be be lawfully and honestly come by, that is, that they are either given or bought, for if they be stong the sound of the surface of the surface, if stolning they seem to bought, for if they be seen and they seem to good; as it is with Rue or Herb of Grace, if stolning the stoles are they seem to bought, for if they be seen and they are either given or bought, for if they be seen and they seem to good; as it is with Rue or Herb of Grace, if stolning they

Now if when we shall have removed from Bees all creatures that annoy them, what we shall Now it when we man may be the confervation of their health, and the cure of their differees, I do not fee, yet mitner adde to the contest and all filthy Lechers, mentituous persons, those that have the nur-First, therefore remove from them are them. The first, therefore remove from the that find of greate or kitchingshife, ning of the reins, baths, smoke, dunghils, laystals, all those that smell of greate or kitchingshife, or having nothing elfeto do, of on purpose to offend them, stand before their Hives mouth, or maying nothing entered with the breath of Toads or Serpents, purge with Balm, Gentle, Thyme, or Fennel burned. See that they live nearly and daintily; kill all predatory or devouring veror renner burned. See that they five hearty and the figns or fymptomes of their difeases being perceived and known, apply the cure of them. Now the figns of Bees, as of other creatures also, being not well, are gathered from three things, that is to fay, from their refraining to be in action, from the external garbof their bodies, and from their excrements. For the lotie of mirth, lumpish melancholy, vertiginous or whirling gate or motion, their frequent and lazie standing at the door, their fainting in their work, their disdain of flowers and honey, their more then ordinary either sleeping or waking, this or water, the Bees are ill at eafe. As also when their bodies are unhandsome, not trim, rough, not sleek or smooth, scurfle or scald, not shining or glissening, lean and transparent, not well liking, or well fed. Moreover, if their combs have an ill sayour, or if their dung or ordure turn to water, or be full of worms, and when they carry out everyday their dead, not at all regarding their Hives, there are infallible figns of ficknesse, and some epidemical dicase that reigns amongst them, some part of which Virgil in 4. Geo. hath elegantly, though somewhat confusedly touched in these verses following.

If Bees be sick (for all shat live must dye)
That may be known by signs most certainty.
Their body is discoloured, and their face
Looks wan, which shewes shat death comes on apace.
They carry forth their dead, and do lament:

Hanging by th' door, or in their hives are pent. Hunger and cold confumes them; you hall find They buz as doth "ith woods the Southern winds, Or doth the fea when that the waves return Or fire clos'd apin vaults with hilf dubburn.

CHAP. IV.

Of the use of Bees.

Hereas the most high God did create all other creatures for our use; so especially the The Use.

Bees, not only that as mistresses they might hold forth to us a pattern of Politick and Oeconomick vertues; and inform our understanding; but that they might be able as extraordinary foretellers, to foreshew the success and event of things to come; for in the years 90, 98, 113, 108. before the birth of Christ, when as mighty huge Swarms of Bees did settle in the chief Market-place, and in the Beast-market upon private Citizens houses, and on the Temple of Mars, there were at that time stratagems of enemies against Rome, wherewith the whole State was like to be surprised and destroyed. In the reign of Severas, the Bees made Combes in his military Enfigns, and especially in the camp of Niger. Divers wars upon this ensued between both the parties of Severus and Niger, and battels of doubtful event, while at length the Severian faction prevailed. The Statues also of Antonius Pins placed here and there all over Hetruria, were all covered with swarms of Bees; and after that setled in the Camp of Cessius; what great commotions after followed Julius Capitolinus relates in his History. At what time also through the treachety of the Germans in Germany, there was a mighty flaughter and overthrow of the Romans. P. Fabius, and Q. Elius being Confuls in the camp of Drujus in the tent of Hostilus Rutilus a Swarm of Bees is reported to have face so thick, that they covered the rope and the the that held up the Tent. M. Lepidus, and Minut. Plancus being Confuls, as also in the Confulship of L. Panlus, and C. Metellus Swarms of Bees flying to Rome (as the Augurs very well conjectured) did foretell the near approach of the enemy. Pompey likewife making war against Cafar, when he had called his allies together, he tet his Army in order as he went out of Dyrrachings, Bees met him and fate so thick upon his Enfigns that they could not be seen what they were. Philifus and Elian relate, that while Dionyfus the Tyrant did in vain four his horfe that fluck in the mire, and there at length left him, the horse quitting himself by his own strength, did follow after his Master the same way he went with a Swarm of Bees sticking on his mane; intimating by that prodigy that tyrannical government which Dionysius affected over the Countrey of the Galeora. In the Helvetian Hiltory we read, that in the the year 1384. When Leopoldui of Auftria, began to march towards Sempachum with his Army, a Swarm of Bees flew to the Town and there face upon the tyles; whereby the common people rightly foretold that some forainforce was marching towards them. So Virgil in 7. Eneid.

> The Bees stem buzzing through the liquid air: And pitcht upon the top o'th' Lawrel tree; When the Soothsayers saw this sight full rare, They did foresell th'approach of th' enemie.

That which Herodotus, Pansamas, Die Cassius, Pintarch, Iulius Casar, Julius Cupitolinus, and other Historians with greater observation then reason have confirmed. Saon Acrephniems, when he could by no means finde the Oracle Trophonius; Pansama, Alam Alexandrinus, Theoretic ya Swarm of Bees. Moreover, Pintarch, Pansamas, Alian, Alex. Alexandrinus, Theoretius and Textor are Authors that Impiter Melitans, Hiero of Syracuse, Plato, Pindur, Asim Comatus, Xenophon, and last of all Ambrose, when their nurses were absent, had Honey dropt into their mouses by Bees, and so were preserved. Xenophon also in his Oeconomicks calls making of Honey, the shop of Vertue, and to it would have mations and mothers of families go to be instructed. The Poets willingly yeeld themselves to be compared with Bees, who following nature as their only Missies, his no Art at all. And so Plato affirms that Poets were never able by Art to smill any master-piece. Insomuch that Pindar doth vanish himself in this to be superior, or to go beyond Bacchildes and Simonides, in that he was taught by nature not by Art. Bees whels provoked are harmlesse, but being vext they will sting and that most shrewdly. Such is the condition of Poets: from whence are occasioned these verses of Archibechus.

He that doth move me, quickly finds my sting, I'l make him cry, and through the City ring.

Wherefore Plato in his Minos gives it as a rule to those that desire peace and quiet, that they be very well advised how they intermeddle with Poets and Bees. To conclude, so many are their virtues worthy our initiation; that the Ægyptians, Greeks, and Chaldran took diverse fieldly blicks from them; as when they would express subjects obedient to their Princes, they set it forth in figure of a Beevery singular in that virtue; when a King loving to his subjects, they postay it likewise and set it forth by a Swarm of Bees. Other the like enablemes are to be sound in Pierin, Hieroglyphicks worth the labour of searching for. From them the Country seconds learned their skill of prognostication of the weather. If of they perceive wind or rain before

it comes, and foretell forms and showres that are at hand; when they are ready to come, they are ture not to fly far from their Hives, but will feed themselves with their own moisture, All those things being as they are, 'tis no wonder that Aristans, Philistrius, Aristomachus, Solonios Menus Sammites, and fix hundred others that have wrote of Bees, have left the pleatures and de-Menns Sammites, and his hundred others to have lived in the woods, that they might be the more parfectly acquainted with their conditions and manner of life, and be the better enabled to parfectly acquainted with their conditions. Neither was Virgile're the worfe for being fo well feen in their Hiltory, the which he hath most elegantly fet down in the fourth of his

But what their bodies and their labours do work upon our bodies, it is now worth the pains to relate; whereby we may assuredly know, that there is nothing in Bees but what doth serve for

our health and welfare. For,

Their use in Medicine.

₆906

First of all, their bodies assoon as they as they are taken out of the Hive, and pounded and drank with fome directick, or wine and milk; do strongly cure the dropse, dissolve the stone or gravel, open all the passages of the urine, cure the stopping of the bladder. Bees the stone of graves, open and help the dulnesse of fight or hearing. Also being pounded together they cure the griping or wringing of the belly or guts, being applied to them ounded together they can be then felves being drank down after it, do expell it: they forcen hard ulcers in the lips; being bound to a carbuncle or running fore, they heal it; they core the bloudy flix. Honey being strained with them, helps the crudities of the stomach, or specks or red pimples in the face, as you may fee in Hollerius, Alexander Bened. and especially in Plior red philippes in the tacts as your sand when they are through dry make them into powder, as Galen in Euporist. Writes, mingle them with the Honey in which they died, and annoint the parts of the head that are bald and thin haired, and you shall see them grow again. Pliny in like manner teaches to burn a great company of Bees together, and mingle the after with oyl, and anoint the part; only with this caution, that the adjacent parts be not rouched therewith yea, Honey scraped of Bees that are dead, he affirms to be very soveraign in all diseases, and very useful. Erotie in his 61. chap. de Morb. mulieb. tells us that their Ashes beaten with oylis good to make the hair white.

Moreover, Bees are very profitable and useful in regard they serve for food to other creatures: as to the Bear, Lizzard, Frog, Serpents, Spiders, Wasps, Swallows, Houp, Robin-red-bresk-Ti-

mouse or Muskin; as Bellonius hath observed.

Ralladius faith, that some men are wont to take great delight in hunting after them; and he tells you how you shall finde them out in these words. In the moneth of April, in sumy places, if the Bees do frequently refort thither, either for food or water, then certain is that their nest or Honey-shop is not far off, but if there come thither but a few in a company, then 'tis a fign that they harbour farther off. But when they come very thick, by this trick you shall finde out their Swarms, take a little wet Oaker and mark them on the back, and there remain, while those that were mark'd return back thither again; if they make a speedy return, then they make their abode not far off; but if they tarry more then ordinary, then they relide farther off. Now by this means those that are hardby may easily be found out; but to come at them that are more remote and farther off, do thus; take a piece of a Cane and cut it off at either end at the joyne, and make a hole in the midst of it; there put in a little honey, of sweet wine boyled half away, and lay it by the fide of the fountain or water where they refort . When the Bees come thither, and are drawn in by the fent of the honey, hold your thumb close upon the hole, and suffer but one Bee to go out at once, follow that as far as you can well difcern him, when that is out of light let go another, and by this conduct at length you will earlly finde the place where the Swarm is, If it be in some hole or cavern of the earth; make but a smoke upon the mouth of it, and all the swarm will hurry out, and when they come forth, being a little scared, with the tinkling of a brass pan, they will hang themselves upon a little bough as it we ea bunch of grapes, from whence having a veffel to put them in, you may take them away. If they chance o make their nest in the arm of a tree, then take a sharp saw and saw off the bough above and below them, and cover the middle part where they are, with a clean cover, then carry them where you please, and put them in a Hive.

By this Art you may finde their Swarms where they use in woods, dens, or hollow places, slony or craggyrocks, or any place whatfoever: only fee that you begin your fport betime in the morning, lest the night overtake you, and you lose your game. Neither only are they delight full sport to them that hunt them in the day time; but also (if Fabritius and Artemiders do not deceive us) if a man light upon them in his dream when he is a fleep; if he be a poor man is forestells he shall be tick; if a King or a great man, that his subjects, or those that a under him be loving and obedient. But he that dreams he had a stock of Bees, but in present hath them note its flow had a constant to be fall. will be loving and obedient. But he that dreams he had a trock of Bees, but in refer had them not, 'tis a fign of a decaying effate, and of some imminent approaching distiller to be fall.

Of so great use here Bees: 'and so variously hath dame Nature the Continuer of all things spotted her self, or rather salest pairs indeed in furnishing them with such rate guilluss of all forest as wherewith you have heard them to be endowed.

But to what purpose is (will you say) that sting, against whose power and empire; the same says are some self-basew no remedy ? Toonsels) and experience reachests as much that Bees stings are some size.

rimes venoniois; but it is only of those Bees which are raving mad, or burning with some feaver, anger, or hunger. Otherwise they do little or no harm at all: and therefore Dioscorides did not deign so much as to mention the symptomes of the stinging of Bees; supposing it a childish inule thing for any man to much as to complain of the fling of a poor little Bee: later writers ohierve that the fling is accompanied with redness and tumor, especially if the fling do yet flick obleve that the flesh, which if it go in very deep sometimes proves mortal, as Nicander Writes in his Therica. The Ancients (that we may prove the fling of Bees to be converted to some good nie) as Suidas reports, were wont to punish cheaters with them on this manner; They strip the malefactor stark naked, and besmeared his body all over with Honey, which done, and his hands and feet being bound, they exposed him to the heat of the scorching Sun, that what with the piercing raies beating upon his body, what with the stinging of the Bees and slies, and their often stabbing and wounding him, he did at length suffer a death answerable to his life. But if you would indeed refolve to go sting-free, or at least heal your self being stung; expell out of your minde, idlenets, impiery, theft, malice; for those that are dehl'd with those vices, they set upon to chuse as it were, and out of natural initinct. Beware also in especial manner, you wear not red earments, which might represent you to them, to be a murtherer or man of bloud; as also that you be not taken by them for an unchaste or unclean person, which it seems they naturally know and abominate (as hath been faid before) They which carry the bill of a Wood-pecker in their hands when they come near them, although they do somewhat disturb their Swarms, yet (as Plin) faith) the Bees will not hurt them. Nonnius reports, that if you rub and beat to powder the herb called Balm-mint, or Balm-gentle, their ftings will not be able to hurt you. Florentine gives in charge, that he that is to gather the honey should annoint himself with the oyl or mice of Marshmallowes, whereby he may take away the combs without danger. But the juice of any Mallowes what soever will do the like; and the better if they be rubbed with oyl; for it doth both preserve from stinging, and is a remedy to those that are stung. But be it granted that diseases be contracted by their stingings; yet 'tis but taking a few of these Bees that are found dead in the Honey, and let them be carefully applied, and they presently cure them; and take away all the venome and aking of them.

What shall I fay? God never created a creature lesse chargeable, and more profitable. They arebought for a very little-money, they will live in all places whatfoever, even in woody and mount inous Countreys. The poor as well as the rich gain a great return or revenue by keeping of them, and yet need they not put more in the pot, or keep a servant the more for them. Merula reports that Varro rented out his flocks of Bees, for 5000 1. of Honey; and in Spain out of a little Village containing not above an Acre at most, that he gained of the Honey there gathered 10000 Seffercies, i. 6. 50 l. of our English money in one year. Besides all this, we have from their shops or store-houses, Wax, Bee-bread, Bee-glew, Rosin, Honey-combs such as no Commonwealth can well be without; not to repeat their virtues, which are no less wholsome for the minde, then those are profitable for the body and maintenance of life. And first of all we will treat of Honey, that immortal, nectareal, pleasant, wholsome juice, and principal of all works

and operations.

CHAP. V.

Of the Name, Difference and Use of Honey.

T the first Honey had but one name, called in the Hebrew Dabelch; but since that strange A and confused Polyglottology, or speaking with divers tongues it was called of the inhabitants of Arabia, Hel, Han; of the French, Miel; of the Italians, Mele; of the Dutch, Honichsem; of the Germans, Honig; of the English, Honey: the Greeks called it, wise, from the admirable care and industry of the Bee in making of it, as Eustachius notes: from whence comes malitum, Melitellum, of win, in Potphiry. This for the Name: But what it is yet after all is much controve fed amongst the learned. Some there are that fondly conceir it to be the spittle of the Definite-Planers, of the gelly falling from the Stars; Others, the purging of the Air, or the sweat of the on of Honey, Hearing; bur in my judgement it may more properly be termed the Chylus of the Bees, gathered from some sweet matter, but having its perfection and consummation from their ventricles; and afterwards by expuition or vomit cast out into the cells or Honey-combs. Aristotle, Pling, Auticin, Senica, would have the Bees not be makers of the Honey, but only gatherers of it: for thus they write; The Bees, (say they) do gather the Honey from the dew of the air, especially at the riling of certain Stars, and from the conjunction of the Rain-bow; for they make no Honey, but Honey combs of ly, Gales and the 3, de Alim fat, hath these words: I remember (faith he) who time, in Summer we girnered a great quantity of Honey from the leaves of the trees, and then the Countrely in way of sport lang, Jupiter rains Honey. But then the night before had been aceding cold, as it could be in Summer by the frength whereof the fweet exhalations, and val lour being drawn up by the Sun were congeated together. Now with us this is a very rate acdent; but in Mount Libanis it happens every year; and therefore they spread skins upon the

ground under the trees, and flake them, and the Aerial Honey that falls from them, they put up ground under the trees, and make them, as all other things, do differ in substance or matter, it in pots, and earthen yestels. Now Honey, as all other things, do differ in substance or matter, it in pots, and cattless resident, the months is either Aerial or Terrestrial; Aerial Hony is one thing, Terrestrial another: For in the months of May, Jane, and July, a kinde of heavenly Ambrofia falls down upon the leaves of plants (which of May, tane, and tany, a kinde of meaton, very fweet in tafte, liquid, pure, and as iweet as figur they call honey dew, but I rather mieldew) very fweet in tafte, liquid, pure, and as iweet as figur they can noney dew, but I rather mark in, the Bees I grant do ripen or bring to maturity, but that it felf; this being gathered and drank in, the Bees I grant do ripen or bring to maturity, but that it felf; this being gatnered and drains in the make any real mutation, I constantly deny; unlesse perchance you will say that the refining they make any real mutation, reclinating the dew, is an alteration of the species. Gal. lib. 3. de Alim. fac. affirms that the matter of Hother dew, is an alteration of the species. Gal. lib. 3. de Alim. fac. affirms that the matter of Hother dew, is an alteration of the species. the daw, is an atteration of the species of the inical and the initial of the initial do call not the very dew it felfs but something near of kin to it: the which Bees gathering do call not should be species of the initial and the species of the species of the species of the initial and the species of the species of the species of the spec ney is not the very dew it less, but they do not change the species of the juice; as Avicen also saith, up again into their cells, but they do not change the species of the juice; as Avicen also saith, up again into their cens, but this aerial Honey is gathered is of two forts; coagulated or thickned But this aerial dew, of which this aerial Honey is gathered is of two forts; coagulated or thickned But this aerial dew, or which the best Honey is made; especially if it retain the same venue it Manna; and riquid, or which the very fliding from fuch a height, and even with the very fliding of the fall by reason of the impurity of the air contracting defilement, and being infected with the exhalation reason of the impurity of the an contract upon which it lights, it looseth much of that heavenly verue, of the leaves, and juice of the flowers upon which it lights, it looseth much of that heavenly verue, of the leaves, and junce of the nowers after thisted in the ventricles of the Beesscells, honey-combs, although some remain, and being so often shifted in the ventricles of the Beesscells, honey-combs, attnough tome tentain, and to my sold to it. But in the beginning, Honey is like pure rock-water; it hath some strange qualities joyned to it. and in the fuft daies it boyls like new wine, in the 20. day it waxeth thick, a while after it is covered over as it were with a thin film or membrane, which with the froth of the heat of it, congealstogether. Terrestrial or earthy Honey we call that, because the dew going away, it is such our of the very sweat of the earth, and the sweeter part of the plant, of a thick substance indeed, and a quality answerable to that from whence it was extracted. And from thence it takes the name of Graffe-honey, Bean-honey, Lilly-honey, Violet-honey, &c. respect being had to those things from which it is collected or gathered. But that Honey is belt for substance, which is of fat oily consistence, partaking of both, which doth of its own accord run out of the combs, (in The best Ho-Greek called deoffer; or rather deegler) and doth not abound with dregs, and is quickly boyled and doth cast up very little or no scum; and alwaies so tenaciously slicking together, that if you lift it up a good height on the top of you finger, it falls to the earth still homogeneous, unsevered, no way parted afunder, but remaines in one continued flake, or line. And to conclude, that which if fire be put to it, will soonest arise in flame. Unless there be all these properties or most of them in your Honey, you shall discern the substance not of good Honey indeed, but of base, adulterate, impure trash.

The I beater of Infects : or,

Accidental

ney how

The Accidents or accidental properties of honey, are likewife forme good, some bad, both of them are taken from the season, place, quality. If you respect the time or season, the newer the honey the better it is accounted, and the Spring or Summer honey far beyond that is gathered in Autumn. The first of these is gathered from flowers only, and those very tender and newly budded (thence called Anthinum, or Flower-honey). The second is collected of nothing but herbs, and ripe flowers, thence called declor, or Summer honey. The third, last and worth is had after the first Autumnal snowres, and that very sandy or gritty and woody, gathered only of Heath or Ivie (which are then the only things green that are left) and from thence is called Ericaum, Heath-honey or Ivie-honey: all which (as I faid before) have their greatest commendation from their freshness or newness, because with long keeping and concoching, they wax birter; from whence the Proverb, He that will make a good mixture of wine and honey, mult mingle with new Hymertian Honey, old Falernian Wine. It is also better or worse in regard of the place whether proper or common. If yourespect the proper place, or the vessel wherein it is contained; the best honey is still found in the bottome, for the dross which is contracted either by foyl of herbs, or by the air whilest it falls from fo high a place, is cast up to the topassioth; and in the bottome it is found to be more glutinous, ponderous, luscious, and better com-

In what coun-Honey is tobe found.

If you would attend the common place or region wherein it is gathered; according to the man

treys the best ture of the Countrey, so is the value of it.

In the first place and above all other, the Attick, Athenian, Hymetick, especially, when made in the silver Mines, hath been hitherto adjudged the best honey, both in regard of the excellent nature of the Bees themselves, as also for that those Countreys do abound with Thyme and other choice plants and herbs, and likewife in regard of the goodnesse of the place where the thands are made. Diofeorides gives the next place, to the Islands of the Cyclades, or the Estat Islands (which is year lucions and last (which is very luscious and pleasant, and welnigh as good as the Aerick) And the third and last place to the Hyblean, and Sicilian.

Pohan. Bauhinus a very learned Physician, and surpassingly well seen in the knowledge of surples, faith that he faw of this Attick honey in Verona in an Apothecaries shop, which be found put up in the bladder of a Flanks to the bladder of a Flanks to the bladder of the th up in the bladder of an Elephant, very thick, and weighing 21. pounds, of the length of two or hirs, of the breadth of a chief for bits, of the breadth of a cubit and a half. I suppose it was brought thither out of Africk for how should an Electronic transfer out of the broad and the board of the board o how should an Elephants bladder be had in Athens? In the judgement of Caratanny that hone, which comes from Caratanny that hone, which comes from Cephalenia, an Island in the Ionian sea is the best; next to that in Enrops see Sanis and characteristics are sent and characteristics and characteristics and characteristics are sent and characteristics are sent and characteristics and characteristic the Spanish, and that not without reason; in regard the dew for the most part in those hour regions is harrown and the state of the most part in those hours regions is better concocted: and (in all Countreys) where the purest air is, there is the right Honey (i. a.) The Tark Honey (i. c.) pure pale, and is made up as it is, having no need of fire to purge it. The Tar

tine honey is also commended, as Strate, reports. About Tagodas, Melela, Hea, Hascera, the iron Mountain Rhabona, Rebeddenoma 3 70. Legislath there is very excellent African honey made, Ludovicus Cademustus prefers the honey of Simpson Andrew Consalies the Mombaren, Edurades Barbofs the Athiopick, Thomas Logins the Cathaian, Franciscus Alvares the Tigremahonenian, Sebafianus Baro the Samogiticks Enricus the Lituanian, Erelius Stella the Rutian, Thevet the American, P. Lovins is exceeding much in the commendation of Moscovy honey, but not to advifedly, in as much as our Merchants, and Sebaff. Baro a very impartial writer of those things which are seen and done there, do very seriously affirm that in all the Dukedom of Mosco, there are neither Bees nor honey. Albert. Campenfis in his history of Myfia which is called Britus, faith that even in the Hercinian woods, there is extraordinary good honey to be found, and that altogether as good as the Cecropian or Attick honey may be. Elianne affirms that in snowy and icy Septhia, there is Countrey honey very praise-worthy; and that it is carried to Mysia (where it is fold at a very dear rate). But if the heat of the Courrey doth add to the honey purenets and goodness, how is it possible such excellent honey should be had in Scythia, and Samosithia? Is it because the flowers there growing and receiving the dew are better then in other places, and by that means cause it to be clearer and purer? Or is it because of the North winds which are most frequent in those parts, which do purge the air? Or is it because as well Bees as men there are of more strong constitutions, and therefore are better able and do take more pains to refine and work the honey in their ventricles? which is the more likely, seeing they were not able to live at all in that cold region, nor could not arrive at fuch an Age (for there they live very

Of leffen living Creatures.

long) if they were not very healthy and lufty of body.

Now whereas Cardan denies that there is any exquitite honey made in moist Countreys: let England and Ireland challenge him for their right; which being obnoxious to showies and very much rain, a thing fatall to Mands, do yeeld fugh extraordinary pure honey, that it hath not the least mixture of venome, and doth last a long time before it be corrupted or putrified; that we do not speak of its excellent whiteness, hardness, sweetness, hanging well together, viscosity and ponderounels; and other principal figns of the goodness of it; But let us leave off to commend our own Countrey wherein good is to be found; and fet forth those Countreys which are infamous for the badnets of it. Hor the extreme bitterness the Chelchian honey, and next the Carsican, and in some places, the Hungarian, and the Sardinian hath an ill name. For in Sardinia Wormwood, What Counin Corfica Rose-lawrel, in Coldhis the venomous Yew, and all of them in Hungary. Also the ho-treys produce ney is venomous in Heracles of Ponens, and in the flowers of Goats-bane, fading with the wet-bad honey. ness of the spring; for then the flowers contract that burifull venome; which dorn presently infect the honey-deav that falls upon them. There is also another kinde of permicious honey made, which from the madness that it causeth, is termed Mad-honey; which Pliny conceiveth to be contracted from the flower of a certain shrub, very frequently growing there in the woods. Disferrides and Assiss do not amiss impute this poyson to be caused of great plenty of the venomous herb called Libbardsbane, or Wolf-wort which groweth there; in that it is cured with the very same remedies as the venome of that herb is. In Carina, Persis, Mauritania and Getulia, bo dering to Massestia, either by reason of vanours of the earth, or by reason of the virulent and poylonous juice of the plants, poyloned honey-combs are produced; but are descried by their duskie or blackish colour. In Trapezuntum in the Countrey of Pontus, Pliny reports of a certain honey that is gathered of the flowers of the Box-tree, which as it doth make those that are well fick with the noyfome smell of it, so those that are not well it restores to health. On the trees of the Heptocometanes, a people matrunto Cholchis, there growes a kinde of infectious honey. The which poylon being drank makes men stupid, and out of their wits. This was sent by the enemy to the three Legions of Pompey with a soken for the define of peace, they drinking very freely of it, were put both besides their wits, and their lives too (as Strabo saith). Ovid makes mention of the Corfiok honey very infamous, being extracted from the flower of Hemlock, speaking thus:

> I think it's Corfick Honey, and the Bee From the cold Hemlocks flowers gathered thee.

But yet it may feem to be more o much for Dame Natures honour, that she should bring forth a thing so desired of all men, as honey is, and so ordinarily to temper it with poyson. Nay but in fo doing the did not amiss for concernit it to be; that thereby the might make men more cautious indiale greedy, and to excite them not only to use that which should be wholesome, but to leck out for Antidotes against the unwholsomeness of it. And for that cause the hach hedged the Rose about with prickles; serven the Beesa sting hath interded the Sage with Toad-spittle, mixed poyson (and that very deadly too) with Honey, Sugar, and Manna.

The fignis of poyloned hone ware these, it figures the honey-comb with a kinde of Lead-solour, The figns of the nor become chicked tooks of a bright thining glifte ing newstharp or bitter in talte, and hath poyloned Hoafternoge and mesonth finelly incis far, more ponderous, then the other, as foon as it is taken it ney, and the calleth nealing and a loofing softine bell y nantomparied with exacts of sweating. They which gainst it, the dunkined a tumble themselves up and down upon the rold earth, very definous of reftigeration. The disnation poylonic thoney hash the same symptomes with the poylon of Wolfe bane,

and hath the same way of cure. Galen reports that two Physicians in Rome tasted but a very fmill quantity of poyioned honey, and fell down dead in the open Market-place,

Against madness from eating honey, Disservices prescribes Rue to be eaten, and salt fish, and Against magnets from eating lockers they must be vomited up again; and he prescribes ny agrees with nam; and he seems of good honey. Gulishmus Placentia bids to cause vomit fo wonderfully corrects the loating of Simplex, and warm water, eating falt fish before voadimorantily, with typing of violating of the state of th miting, and to fet cold water under the nofthrils, with the flowers of Violets, Water lillies, and mitting, and to let cold water the are Quince kernels bruiled, and given with hot water, as Santhi, Ardoing relates. Avicenna hath prescribed nothing worth speaking of, but what he had from others: for I understand not what he means by his Aumeli.

thers: for I understand not write English man, after so many grave and experienced Physicians. But what if I a youth and an English man, after so many grave and experienced Physicians the what it is youth and an Antidote, viz. to take nothing down but the Bees themselves, The likelyhood of the conjecture doth perswade, and reason it self doth somewhat seem to savour it: For unless that Dame Nature had given to these Boes, a very marvellous power against poyfored honey (as amongst men to the Psilli against Serpents, to Storks and Peacocks amongst the Birds) without all doubt with gathering of it, swallowing of it, and for some time keeping of it in their bodies, yea concocking of it there, they would be grievously pained, and the poyson numing

and dispersing it self through all the parts would kill them.

Now the Terrestrial honey, although it be not alwaies poysonous, yet by reason of the blackness and clammines of it, 'tis not much to be commended : also it is often found to be subject to be infected by the venomous breath of Serpents, Toads, red Toads, and therefore is carefully to

Honey.

Now let us come to the Qualities of Honey; whereof fome are first or primary, others derived from them; some formal, some specifical, which we deservedly call Energetical, por operative. In respect of the first Crass or temper, Honey is thought to be hot and dry in the second degree, for which cause Gales did forbid those that are in Hectick Feavers, and in all Feavers, young men, or those that have the yellow Jaundies to use it; whereas in cold distempers he doth very much commend it, and did prescribe it to those that were troubled with a raw and warrystomach; whomif you gently anoint therewith, it doth very much nourish, and causeth a good colour and constitution of body. If you delire to know the second qualities of honey, (viz. the fmelling, tafting, visible, tactile) the best honey ought not to have the eminent quality of any herb, or other thing whatfoever : and therefore the honey that doth strongly smell of Thyme, Galentejects; and yet is of it felf a most sweet and fragrant smell, and not without a certain spirituous fragrancy; such is that which in the middle of the spring, is perceived to be in the air about break of day. But if it have an ill favour, it is putrefied not being well kept. If it fmell strong, it hath contracted some contagion from Hemlock : if it sting as it were and prick the note with its sent, it is an argument of some poyson, or too much acrimony couched in it. If it shell not at all, it is stark dead, no spirit in it. If it smell of Thyme, Linden, or Teil-tree, Rosemary, Box, Wormwood, &c. it flewes that it is degenerated into their nature. The like is to be faid of the Taste of honey, which is known either by the herbs, age of it, or by the colour of it to be mixt, or adulterate, or natural, that is to fay, firthing, and filling the tongue with a certain fine and lively sweetness, so that it may seem to some to be a little tart.

As for what concerns the colour of the best honey; in the Tigremahonick and Tagodfick Region, that of a milky colour is preferred in hotter Countreys, that which is white and transparent, but commonly that which carries away the garland and is esteemed above the rest, is yellow, and of the colour of Gold. And in the second rank is that which is white and transparent, which I with Arifforte should put in the first place. For that it is a sign of pure honey and not infected with any tineture of heibs. The bright shining is also by him commended if it be not fummer honey, for the honey that is gathered at that season of the year (like wax or butter) er ther by reason of the abundance of yellow flowers, or the scorching heat of the air, it comes to be of a deep and full yellow, yea almost quite red. But if the Erycean or Anthine appear red dishit is not without cause accounted unwholsome, because it is not in its season. Suspected and of ill name, are the black, duskie, bright red, and above all the lead colours, which whether they appear in the comb, or in the honey, sometimes are evident signs of corruption and pure faction, and formetimes of poyfon. That honey is best in touch that is fat, clammy, gluxinous, heavy, and most like to the clear liquor of Turpentine every where like it self, that is pure without any, or with very few dregs, that is melted with a very fost fire, and with the least cold at it were con-

The Energetical or operative qualities of honey are seen in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it; the which is of directions are forced in the use of it. gealed into little flones. vers forts, whether you turn you to the Apothecaries shop, or to the Kitchen, for so mightily doth it nourish, and preserve health entire, and men long-lived, that the Greeks thought the Cyman and Die by reason of their constant using of it, lived long, being old men, as Herodorn, dihenam, and be done Steal to restrict the state of th down Signing testifie. Polis indeed being asked, how it came to pass that he lived to be foold as he will made in the Record Control with was, made answer, Because from his youth he used Oyl without his body, and Wine mingled with

Hopey within. More then this all flowers, innies, famples, and compounded medicaments. or confections by mingling them with honey are preferred entire from putrefaction; in which facontrol virtue it fo excells, that even the Babylenians were wont to bury the dead corples of their noble men in it; as Hirodius Witnesserh in Thalia. Vinciners also and such as deal in Wines that Will play the knaves, when they observe a piece of Wine decaying, and at its last almost then they put hopey to it, to bring it to life again; by which means the sophisticate wine appears pured and relishesh very Well upon the palars though never so critical and curious. It is not subject to purefaction. Fruits, and all other bodies are kept in it very long. Yet if it be but touched by its onemy, breads in putrefies. They therefore that fell honey, are very wary, lest children as they safe by should dip their bread in it. for so is will presently corrupt, and turn into Ants or such like creatures; if we will believe Paracelflus for his natural skill, in the nature of things, a most famous Philosopher. With admixtion of honey also Gales amendeth the naughtiness of sweet meats when they begin to fail. Honey mingled with other things, doth both noutish and cause agood colour; but taken by it felf without any other thing, it doth rather make the body lean than nourishin; because it dorh cause arine, and purge the belly beyond all measure, Hippocraterfaith, if you take the feeds of Cucumers, or the feeds of any other plant, and keep them for some time in honey, and afterwards fow or set them, the fruit that groweth of them will take

As for the medicinal and Physical vertues of Honey; It caufeth heat, cleanfeth fores and ul- The medicinal cets excellently, wears them away, and removes them in what part of the body foever gathered; vertues of Hoas Galen, Avicen, Celfus, and Pliny have observed. It perfectly cureth the disease which causeth ney. the hair of the head or beard to come off by the roots, called the Foxes evill, and other filthy ulcers of the head. Plin. To regain hair loft by the difease aforesaid, and for long Agues, it is very effectual, if the party be anothted with it rawasic is; or with the honey-comb newly dreined or emptied. Galen. But above and beyond all the Oyl of honey dittilled dorn effect it. The water that droppeth from the honey, doth excellently cleanse the skin, provoke urine, extinguish the burning heat of Feavers, open the oblimations of the bowels, quench thirst. The chalk or falt of it, as it is of all corrolives, the least painful, fo it is most energetical and operative, and therefore is very much commended by Chymicks, and Chirurgeons, for to care that kernell or tumour of flesh which groweth upon the yard. But how many, and how ample virtues that quinteffence of Honey (as they call it) hath attained against the strength of all tifeases whittoever, is excellently described by Isaacus Belgar the predecessor of Paracellus. Nay without doubt, if wilde honey, and raw, was able to to protong the health and live of Demorrates, Pollie, John the Baptift, in a words of the Pythagereurs, and Cyrneaus (as aforementioned) how much more will it do being refined, and heightned to the highest degree of nutrition? The Brienman who took the best way they could to provide for their health and their pleasure, sed alwaies upon Ambrosia, as Tantas reports, which did consist of a tenth part of honey; as if they meant by the use of it, to stave off all pains and griefs, and live free from all diseases and maladies. It doth wonderfully help the ulcers in the ears if it be powred warm into them, and effeccially if an ill fent be joyned with them. Moreover in their hilling, noyfes, inflamations, Galen commands to inftill Assick Honey, Butter, oyl of Roses, and as much warm water Marsellus Empirical afed to infuse into the car that was pained. The same also very much commends honey mingled or kneaded with the ordure of a young Infant, to cure the dulness of the fight, and the white spots in the eye. Vegetine by this means cures the watery eyes and dropping of the eyes caused by rheume or distillation. First of all a little below the eye he drawes bloud and anoints them with the purest honey till it be whole. But yet care must be had (as Columbila very well hints) that as often as the eyes are anointed with honey, they be befreared round about with melted pitch and oyl, left the Wasps and Bees infest and hurt them. Hear also what Marcellus faith, touching the clearing up of the eyes, and he prescribes this: The honey pure and neat wherein the Bees are dead, let that drop into the eyes; or honey mixt with the aftes of the heads of Bees, makes the eyes very clear. And again mingle Affick honey with the first ordine the Infant makes, together with the milk of the Nurse; and with that anoing the eyes that are fo dull what ever the cause of it be; but first of all you must binde the patient to a form or ladder; for otherwise such is the strength of the medicine, that he will not be able to endure it. Which is fuch a prefere remedy, that in three daies, it will fully reflore the fight, and take away every blemish of the eye. The Gall of a Vulture mingled with the juice of Horehound (twice as much in weight as the gall is) and two parts of honey cures the fuffusion of the eyes, Gal. in En-I'mil. Otherwhere, he minights one part of the gall of the Sea-Tortoffe, and four times as much hothey and anoints the eyes with it. Sereme prescribes such a receipt to cause one to be quick lighted

> Mingle Hyblann honey with the gall Of Gones, 'tiv good to make one fee withall.

Give Infanes butter and honey, for nothing is better for their breeding teeth, and for fore mouths. Galen bids us rub their gums with nothing but hondy. For it wonderfully helps to their reeding of reach, preferring, cleaning and beautivying of them. Also against the pain of the limes. If with Ausbian homey you joyn field poppy is carefit. And foindelines there honey

is mingled with clear water: and this, as Serense and Pliny tellifie; doth notably cure the direct of the tongue in Feavers, the Quinfie; and the difeafes of the Livula; Throat, Jawes, of the Tonof the tongue in Newton, the Country of breathing, and to cause one to expectorate; either byit felf, or mingled vith other things, it is highly commended by Hispotrates. And for the convultion of the taps of the with other transgates mighty continuous the drinking of cold water and of that wherein a honey-lungs (which bueth to be a deadly disease) the drinking of cold water and of that wherein a honey-lungs (which bueth to be a deadly disease) the dominate he not been shall risk the state of the st lungs (which there to be a deadly disease) the storhack be not not; cholerisk; birtery naufeating comb is steeped is very effectual. Also, if the storhack be not not; cholerisk; birtery naufeating or feaveriff, it makes it ftrong and vigorous, and nourisheth it much; not suffering milk to curdle or feaverith, it makes it tirong and vigoth water and butter it is good against the stone. It is cleanseth the stone. in it: it cleaniers the reins, boyled with the contwardly applyed with the deal Bees; for centa. It eafeth the pain of the spleen; but it must be outwardly applyed with the deal Bees; for cenna. It eateth the pain of the inposent out it fallen, faith Galen. When it is rand blockeneth the taken inwardly it hurts both the liver and the fpleen, faith Galen. When it is rand blockeneth the taken invarious in much both the Bees, or with new cheefe it bindes the belly fo much the Gales holds belly, but boyled with the Bees, or with new cheefe it bindes the belly fo much the Gales holds belly, but noyled with the Dyfentery and colick pallions: so doth Colin also and Plin, Hip. it to be a secret against the Dyfentery and colick pallions: so doth Colin also and Plin, Hip. poerates mingled honey with all Medicaments that were to fosten the belly. Honey mingled poerates mingled money mangled with rolin, is a cure for the cold Testicles, as Pliny faith, who also affirms that the assess of Oxeleather mingled with honey, cures all running fores, and borches. Nitre with honey and Cowes milk, cures ulcers of the face; and the froth of honey with oyl of Walnuts, amends the burning of the skin: it is excellent for old people, and such as have cold stomachs; and being boyled it discusses wind, and moves urine mightily. Galen. Hollerins reckoneth honey amongst Diphoreticks, because it openeth and maketh the passages clean: Gaten placeth it amongst Direticks. It layeth down its acrimony by being mingled with water, or being boyled; and therefore Galen prescribes boyled honey, to close up ulcers that are hollow. Salt with meal and honey takes away the pain of a joynt that is diflocated, discusses the swelling, and make it more apt to be reduced. I might here set down the plaister of Assists and Assists called Dis. melleum, the Tapfimel of Arden, and all fyrups that were anciently made of honey. In whose place the Neotericks have put sugar, but I know not by what reason, For if honey of Alberton ionio as good, be at hand, and doth not want its due preparation, do not use sugar that is earthly, reedy and so full of dregs, not comparable either for use, original, or any way whatsoever with this heavenly dew honey. But to let this pass, let us reckon up the kinds of drinks and mens made of honey. Six kindes of honey-drink the Ancients made principally. Honey and water, honey and wine, honey and vinegar, the washing of the combs, juice of some grapes and honey, fea-water and honey.

The first is called by Pollux and Nicander, Hydromel, or unhines lov. Galen, Pliny, Aeginta and Dioscorides have set down the making of it. Hydromel of Galen. Take sweet pure clean fountain water 8, pounds, the best honey 1, pound, boyle them at a fost fire in an earthen vessel, take off the skim a top oft times, and boyl it to its thickness. If it nust be drunk prefently, it must be made thin as water, if it must be setup to keep, boyl it longer, till it be thick, as a julep; if it be kept long it pierceth deeper into the parts far off, and is sooner convented into choler. Also boyling acquires to it many more faculties; for being little boyled it inflates more, it purges more, and nourisherh lesse. Longer boyled, it dissipates wind, nourisherh more and purges leffe. It is spiced at pleasure, with Ginger, Sastron, Gallia Moschata, Lignum aloes, Oc. It is made also another way, of honey 1. pound, water 8. pound, leaven 3, ornces; put all in a wooden vessel, leaving three or four fingers empty that it may work the better: when it hath done working, stop the vessel and let it be well hoopt, and after three months it will be fit to drink. Hydromel of Pliny, Take of pure rain-water that hath been kept five years, 12 pound, boyl it to thirds, add to it a third part of old honey, and in the dog-daies fet it in the sun for 40 daies, and letting it so stand, on the tenth day stop the vessel, this is called Hydromelsthan with age will tafte like wine, made no where better than in Phrygia. It was given to fick people that defired wine, but now it hath been forbidden many years. Hydromel of degiatts, Take the juice of bruifed Quinces 5 pounds, forntain water Sextarii, boyl them till they grow folt, take them from the fire, let them cool, then strain them, and crush out the Quinces and cast them away, add to this water half honey, boyl it, fcum it, till an eighth part be confumed: fome make it of sweet Apples or Pears the same way. Hydromel of Dyoscorides, is made of two parts of old rain-water, and one part of honey mingled, and fet in the Sun. Some call it Hydromel, became it is wont to be made of the washing of the honey combs with water, but it must not be made fironger, because it will hart sick people by too much matter proceeding from the wax, Hydromel after it has been loved by mel after it hath been long kept, is as strong as small wines, or Lora, being but half o old. Wherefore it is preferred before them in abating inflamations. The use of old Methegin is condemned, for such as are inflamed or costive, but it is good for weak stomacks, and such as loath their meat, or fick people that fiweat much, or for those that are thirsty, or after a burning fear ver hath wasted a man. Aerius describes a Clyster only of honey and water to move the belly, and with the same he cleanseth hollow ulcers. Galen commends, and uses Melicrate (wherein fome Hysop, Origanum, or Thyme, or Peniroyal hath been boyled) to prepare and purge gross humania are commended. humours in an acute disease, but he commends it not for the want of a stomach. Lately the English found our annual control of the want of a stomach. lish found out a new composition of Hydromel, (they call it Varii) and serves better for this than any Wine. The preparation is this, Take Barley torrested after due steeping in water, what was played benefit to the preparation is the barley torrested after due steeping in water, what was played benefit to the preparation in the barley torrested after due steeping in water, which was the barley to the you please, boyl it long in 5 quarts of fountain water, till it taste well of the malt: I pound of this hoyled with 2 and after male malt. of this boyled with 8 pounds of honey, and 20 pounds of water, makes a drink that talks mole water, makes a drink that talks mole water, makes a drink that talks mole water, wat (weet, and is most healthful for use. It nourishesh well, is hardly corrupted, and keeps very long. Hydranel of the Moscovites, Take of the decoction with Hops 12 pounds, purified honey scummed I pound and half, tofted bread firowed with the flour of malt, one piece, put all into a wooden veilel well covered, and place it near a stool, take away the froth that rifeth, twice a day with a wooden skimmer that hath holes in it; after 10 daies fet it up in your cellar, afset 14 daies drink it: They make it the same way in summer with fair water, and made this way they drink it in winter, and when they defire to be drunk. In Rufs and English they call it Mede.

Meur. 2. Ominuelis, it is called honeyed Wine; Pollux calls it Molicraton; Plantus, honeyed Wine. others call it Mulfum. Ariftans was the first that brought this into Thrace, being taken with the incredible sweetness of Honey and Wine mingled together. Mulsum made of honey of Herareles, when it growes old cealeth to be hurrful. Pliny. The new writers describe this potion thus, Take I gallon of the best Honey, 6 gallons of old Wine, Salt 2 ounces; it must then be stimmed as it works, then put in the Salt, and feafon it with Annife-feed, and roots of Elecanipane let down into the veilel with a bag. The Egyptians make it otherwise, namely of Raisins and Honey, which they call manades because it is of a very sweet take. Oenomeli spiced, Take Pepper washt and dried, 8 scruples, Atherian Honey 1 sextarius, and 5 sextarii of old white Wine, mingle them. Celfus (as I remember) and Celius speak of it. Aurelianus in the cure of the Sciatica. Also there is a kinde of Mulfum which the Greeks call King with Confishing of 26 ingredients, Gorreus. May be it is the same which Atheneus cals was would . For would is a drink made of Wine and Honey, and divers herbs mingled. Such as our Welch men call Metheglin. The Irih prepare a distilled Oenomeli made with Honey, Wine and some herbs, which they cal Vanebath not unfit for a nation that feeds on flesh raw, or but half sod. Mulfum made of sweet new See Buonymus Wine the Greeks call Nectar; to new Wine sodden, they add a tenth part of Honey, but this his Nectar in kinde is offenlive to the stomach, and causeth windiness; it is given to jurge the belly. Hippo- Wilkern his crates cals it Melibedia, and Melichronias Galen notes. Atheneus writes that another kindeswhich perial Anti-was true Nectat indeed, was wont to be made about Olympus a Mountain of Lydia, of Wine, & 195. Bees-combs, and (weet flowers. I take notice that Alexandrida did not think Nectar to be dinkbut the meat of the gods. For he faith, I eas Nellar cheming and ministring to Inpiter I drink. Ambrofia. You Homer and the greatest part of the Poets took Nectar for drink. Dioscorides made Oenomelithus, Take old Wine 2 Sextarius's, the best Honey 1 Sextarius, Some that they may drink it the fooner, boyl honey with wine and frain it. Some for profit fake to 6 fextarius's of new wine working, add one of honey, and when it hath works, they put it up in a veffel, for it remains fweet. The use of honied Wine is this: It is given in long Feavers that have weakned the florach with crudinies collected in it. It loofeth the belly gently, it provoketh urine, it cleameth the stomach, it is good for the disease of the joynts, faults of the reins, a weak head, and to women that drink no wine, for it is pleafant in finell, and nourisheth the body. It moveth somit drunk with oyle, and it is profitably given to them that have drunk poylong as also for such as are weak, and their pulse is feeble; for such as are troubled with a cough, and a short breath, or Impostume in the Lungs, and those that are wasted with extream sweating. But then it is forto mingle it with Hydroniel. Also Galen proscribes to them Melicrate qualified with water, that have had a shaking fit not above a week, and nature being yet strong. Some there are that uttorly condemn this in Feavers: but that must be understood of some times in Feavers. Remulusia certain quest of Casars, being asked how he had preserved the natural vigor of his body and minde to long, (for he was above a hundred years old) he answered, Without with Oyl, within with honey and wine fodden together, as Polito did: That we may the more wonder at the use of Mulfum, which the Ancients efteemed very much, for that they were perswaded that all actimony of the minde, was pacified with sweet liquors, and the spirits made peacable, the Paffages made foster and fitter for transpiration, and that it was also physick for manners. Pli-

3. Oxymeli, or honeyed Vinegar is thus made, as Pliny thinks. Take honey 6 pound, old Vinegar 5 Homine, Sea-falt 1 pound, rain-water (which Galen likes not of) 5 fextarii. It must all be made scalding hot ten times, and then set in the Sun, till it grow stale, and Oxymet is made. But it falls not above one years. All thefe, as also all made Wines are condemned by Themison thief writer. Galen prepares it thus. Lev the best honey be clarified, and add so much winemegar to it; that it may please the fick mans palate, boyl them till they are well mingled; and When you will use it, mingle as much water as you please : it is boyled enough when it sends font no more fourn. Some there are perhaps that deliver these compositions somewhat otherwife, and Dioscorides he differs from Misues, and Nicolaus from them both. In Misue you shall finde ten several forts of it; in Nicolans I have seen seventeen: some simple, some compound with Squills, Thyme, Flower de luce, and other herbs and roots.

Also Gefner brought in an Oxymel with Hellebore, which he commends not a little in his Greek Episse to Adolphus Otto. To make thin, thick and clammy humours, and to root them our; but especially to make way for insensible transpiration, that is to draw forth from the the to the superficies of the body. But you shall finde every where scattered in the Book of his Epistles, what force it hath against Melancholy, Cacheria, Dropsies, Epilepsies, and Fea-Wife, where also you have the Oxymels made with Hellebore, the great and the small.

4. Apomeli of Philagrius in Officera: Take white combs full of honey I pound, fourtain-Water 3 pound and half ; break the combs and prefs out the honey, boyl this water and honey water 3 pound and man ; bload that which as it were the waxy part fwim a top and be by together, untill the frosh of it, and that which as it were the waxy part fwim a top and be by together, until the troth of hy and that into a veffel. It cools lightly, as Galas faith, where degrees taken one when he is con put a Peaver it is very good. "Avisenna his tyrup of Horey, fore in Phlegmone, and wearines in a Peaver it is very good." Avisenna his tyrup of Horey, feems to be the fame with this. In Nicolans you shall sind three kinds of Aponesiand in Action or bassim, Altharim yet more; for they are changed according to the natures of the disease and the bassium; Attuarium yet more; sol they and charge account upon them, then to describe them at lick parient, that is the reason that we had rather only touch upon them, then to describe them at large. It is drunkall the fummer to cool the body, at which time any man may drink of it, large. It is drunk an the infinitely it is held to be of a middle nature between a Mulfum and (especially when it growes fowrish) it is held to be of a middle nature between a Mulfum and (especially when it glowes to meful to expectorate with, to move wine, to purge the belly, and an Oxymel. Galen. It is also meful to expectorate with, to move wine, to purge the belly, and to ear thick humoniss. Egineta, Ruelimi

The Theater of Infects : ve.

ent thick numbers: Depress and active of translate Bitter horney) it is made of the juice of 5. Omphacomelis (which Grapoldus did not well translate Bitter horney) it is made of the juice of 5. Omphacomens (Which Organical and 1. festarius of honey; boyled together; or fet a funning for 40 unripe grapes, 3 faktarii, and 1. festarius of honey; boyled together; or fet a funning for 40 unripe grapes, 3 materials and thong put it in a vofiel and stop it close, and keep it for your me. the same way almost is Melomeli of Quinces made, Rhodomeli of roses, honey of Myrtils, Rhoites,

Rhodostacte, oc. you may finde their descriptions and use in Actime.

nonnacie, of yournay of equal parts of sea-water, rain-water, and honey purified and ser in the sun in a pitched wessel in the Dog-daies: some to two parts of sea-water add one part of honey, and so cun it up. They both purge, but this hath far the less. Gorrans. It is pleasant in take and mell, it purgeth gently, without troubling the stomach at alle. Pliny. And thus much of

It would be too longfor me, and tedious to the Reader, should I set down all kinde of Means which the Ashenians provided with honoy, and other ingredients; therefore it shall not be needfull to rehearse them; and it may be it is impossible; for divers Nations did variously mingle honey with other things, as with milk, meat, flour, wheat, cheefe, and with Selama, whence are these meats made of honey called 2600, ansuga, who was, one wife makes undirected or honeymeats, and wafers, they have divers names as the thing is made. Athenans. They facilized to Gres this bread of felicity, as the Scholiast upon Nicander sheweth, we call it honey-bread. Also the Scripture teacheth, that the nations offered wafers made with honey to the Sm'and Moon, and to the Queen of heaven: wherefore Mofes forbad the Israelites to offer honey in their offerings unto God, Levisione the 2. But it may be that was rather forbid the Jewes because honey buth a power of fermenting. Also they made it with suet, fresh cheeses oyl and raising pallo to can't fleep, the Ancients made a kinde of meat of honey and poppy-steed, very pleasant, which they called Gecetum, as Festus reports. Also Ambresia which was held to be the meat of the gods, had that exceeding sweetness, whereby it was thought to be so healthful; from honey, to make men immortal; of which Athenaus and Bellenius write at large. But the Indians have the best and the most wholsome juncates, who were held to be Barbarians, but the truth is, they may for their wit be compared with any in Europe, and for what I can fee, to be preferred before

But before honey be used it must be clarified; which is thus performed: Takehoney and fourtain water distilled of each 2 pound, or as much as you please, boyl them and skim off all that fwims a top, till all the water be confumed. Then clarifie it with 12 whites of Eggs. Alyana. But if you make it hard, pure, and fast together, mingle half a pound of the bet wine to one pound of honey thus clarified, boyl them, skimming them till they grow hard, put itin a vial, and for it in boyling water, and it will grow clear, and ftony like fugar-candy. If honey be but mean, it will grow better by boyling : whether honey be sophisticate or pure, you shall know by the ning it; for what is not sophisticate will burn purely. The Author of the Geoponicon, But it you Would separate the quintessence of honey, oyl, salt, water, vinegar, see Isaac Belga, the resurred Euronymus and other Chymists, we will not venture into this ocean, being already plunged in the harbour. Now I shall shew you its first inventers.

Saturn was the first inventer of honey as Macrobins and they of Cyrene boath. Callet and Pling fay that Ariffans first invented honey-works. But Diodorne Signlas writes, that the Corner of Grees first found out the use and way of honey. Some ascribe this to the Thest alient Others to Melistur the most ancient King, of the Greeks. Some to Bacchus, as Quid testifieth. The Greeks feigns that a Nymph called Melifaffirst found our honey, and the use of it, and there she had her Name given her from Bees. Who found it, or when, it is not much matter. It is heavenly gilt, and very profitable for men, if they use it well and warily. The distance of the second sec

CHAP. VI.

Concerning Wax, Bre-glew, dregs of Wax, Pissoceres, Bees-bread, and of their Nature and Use.

WAX in Hebrew, Donagh; in Arabick, Mum, Examacha, Zamache, Aberan; in Greek, xaever, nue's and waken's in High Duch, Wachs; in English, Wax; in Brabant, Wass; in French, Cire; in Italian, Cera; in Spanish, Cicrai; it is either natural or artificial. Simple and numal Wax is the thicker part of the combs that contains the honey; and it is either virgins wax, or of a fecond fort; virgins wax is that the younger swarms of Bees make from the young branches of flowers. (That is the first Swarm put into a new Hive.) For so, as Aristotle and Hollerist tellifie, the Bee-mafters call it, which they diligently separate from the first and new combs, as being by nature the most perfect of all: the second fort, though they reject not, yet is it short of the other for esteem and worth. The way they make wax, is this: They creep upon the flowers first with their fore-feet, and they touch them but lightly, then they wipe and rub themfelves in the middle of them; then they nimbly and artificially lay down the tincture of the flowers which they have wrought with their water or moisture, and compacted between the legs of their hinder feet, and having gathered as much in quantity, and in form like a lentil, when they have this burden they carry it home to their houses. That matter is of divers colours for the nature of the flowers, as yellow, red, pale, faffron coloured, white, black; which is the cause that the wax is of fo many colours: they make wax, faith Pliny, of all flowers and plants, except force and arrach. Artificial wax, is that to which our labour and art must be used. Divers Authors use divers waies to make wax. Palladius in the month of July, takes out the natural wax which he first prepares softly in a brass vessel full of boyling water, cutting the combs small, and after that in other vollels he makes it up into forms, being melted. Pliny takes another way. The wax is made when the honey is prefied forth, but first they are cleanled with water, (that no reliques of honey remain) and he dries them three daies in the dark or in the shade. The fourth day he melts them at the fire in a new earthen pot the water covering them, and then he strains them through a basket; again the wax is boyled in the same pot and in the same water, and other cold water is put to it, so often as you see the vessels smeered about with honey. Columella goes this way. After that the remainders of the combs are diligently washed with clear water, the honey having been first well strained out, they are cast into a brasse pan, then he put water to them, and melted them at the fire, then he powred the wax through stray or rushes to strain it, and then he boyled it again as he did before, and then putting water to it, he made it of what form he pleased, and when it grew hard it was easie to take it forth, because the wax hath water under it that will not let the wax flick to the forms. Now wax differs two waies, for goodness and for use. The best wax is collected by the principal Bees, and is so wrought by the best artists, that it may appear white, tender, handsome, all like it self, pure, somewhat fat, well sented, without nerves or skins, hairs or any supersuous matter. Such as Nonius Marcellus describes out of Varro for Tarentine Wax made by the Bees or Miletus. Wax is so much the more depraved, the farther it is from these good signs. The use of wax is twofold, for physick, or for other matters what concems physick: wax is a mean between hot and moist, cold and dry, and emollient. It hath some gross parts, and that stopt, it not only dries, but seems by accident to moisten by hindring transpiration. Hence it is the matter of other medicaments. But by it self it digests lightly, being laid outwardly, for it hath a little discussing hot faculty, of which it partakes as much as honey doth. Indrink it cures the dysentery, ten grains of wax swallowed so big as millet seeds, will not suffer milk to clodder in Nurses breasts. Dioscorid. Actius bids to give it in the bigness of three Tares. A certain Anonymus, prescribes this remedy against pains of the head and malignant humours arising from a Feaver or any other cause. Take virgins wax what you please, soften it at the fire that you may work it at your pleasure: lay it as a cap on the shorn head of the patient, and upon that pur on a linnen cap that it fall not off. After three daies lay it off, or use it so long till you find the pain gone. Put wax into the hollow tooth that akes, and with a hot probe touch it. Archignes. Wax applyed to the nerves and tendons being bare, will cover them with flesh and cure them. Actius. For the cold pain of the joynts. Take a clout dipt in melted wax, lay it handfomely and as closely on as the fick can endure it for one night, and it will cure it. Galenus. Moreover it is good to anoint the ears with Be its grease, and Buls tallow, and melted wax. Marcellus. You may discuss corns in the evelids with a formentation of white wax. Gal. ex Archigen. No manthat is not an enemy of truth, will deny but that oyl of wax is of principal use to cure pains of the Gout, to fosten hard swellings, and to heal wounds and ulcers. Also it is mingled as Galen witnesseth to the medicament of Asclepias against an Ozena, and it is a certain cure for the Jaundies. Atenain Lady of most blessed memory, wonderfully recommended these pills to Gesner: Take the yolk of an egge boyled hard, and as much wax, with some grains of saffron and syrup of wormwood. Make pills to take morning and evening. They cause thirst exceedingly, but being continuted by degrees without drink, they root out the disease. Also a ball is made of wax to keep up the

The division of course and the second of the

wombsubject to fall down; and medicaments made up with it will last the longer. Cladius the follower of Asclepias. The Greeks were wont to give the Cyrenian juice wrapt up in wax, to swallow it the better. Celius Aurel. It is also the ground of all Cerats and Plaisters. Myrepsia was the first that made a plaister without wax. It not only preserves the living, but it keeps the dead also from purefaction, for which cause, as now it is used by us, so weap up persons of great for tunes in wax, (as Strabo reports the Persons were wont to do.) By a waxen probe hollow ulcers are best to be searched. The Carthaginian wax is the best for medicaments, the next is the Postick which is very yellows and smells like honey, being very pure. Pliny. Which thing I wonder at amongst honey that is venomous: the third in esteem is from Craso, which is from abundance of Bee-glew: the last is the Corsick wax, because it is collected from box, it is thought to have a phy-

The I beater of Infects: or,

fical quality.
Now followes the use of Wax otherwise. They that are rich, or sick, or great men, desiretheir candles to be made of it, by reason of the sweet smell. Also the use of wax is not small in stopping the chinks in vessels, for tents in the camp to keep out rain, for bed-ticks that the feathers sly not out, to joyn pipes made of reeds, as Ovidsang concerning the shepherds of old.

And with the Reed well waxed they play'd and fang.

Also the most excellent Painters painted with wax, as Pliny reports, and they adomed ships withit, This kinde of painting, though it were not hurt by falt, nor by the fun, nor by the wind, yet it was lottwe know not how, when Apelles, Protogenes, and Zenzu died. Also the Ancients were wont to inter over their writing tables with wax before that paper was invented, as Javenal describes And the younger Pliny in his Epiffle to Trajan; I face by the nets, there was no hunting pole or lance by me, but a style and writing tables, I did meditate and set down some things, that though I should have my hands empty, my writing tables might be full. Hence proceeded those old forms of speaking, In the first, second, third, or last wax. For Suctonius proves that the Romans withtheir Testaments in wax; in the life of Cafar in these words. He made 2. Pedius his heirto the last farthing, the rest he placed in the bottom of the wax, that is, in the last part of his will. Nor is the use of sealing wax little, whereby we seal letters and instruments. Of this there are four principal kindes, the Punick or white, the red or Indian, the black or American, the yellow or European. The Punick is made thus. The yellow wax is often laid in the open air, then they boyl it in ferwater, adding Nitre to it: then with skimmers they take off the flower of the wax, and they power It into a veffel that hath a little cold water in it; then they boyl it apart in fea-water, then they sool the vessel. This is done thrice, and they then dry it on a bul-rush hurdle by day and by night in the open air, for this makes it white, the honey being drawn forth by the Sun, and the yellow colour breathed forth: when it is dryed they melt it, when it is melted they cover it with a thin cloth, and fet it in the fun, after it hath flood in the fun it becomes exceeding white, being boyled once more. Wax is made white otherwise, but this is the most proper for medicaments, Pling. Isee that the Greeks speak of is no other than which Pliny calls the Punick wax. Action speaks of white wax in the Unguent Martiatum, and Paulus speaks of it also. Black wax is either natu-741, as in the Molneco Mands, and many parts of America, it is gathered by the Rees themselves (as we read in Thever and in the Centuries of Navigations) or artificial, adding the alter of paper. Redwax or like Minium of India, is made with mingling Anchusa or Cinnaber, There is another kinde of red wax, hard like a stone, but easie to break, the Merchants think their letters sealed with this to be very sure: yet there are some knaves so cunning that they will open them and thur them again not hurting them, that no man can possibly discern it; which art, though a chief Impoltor shewed to Pennius when he was at Paris, yet he was too honest to reval it to this mischievous age. The European honey is of the natural colour, that is, yellow. But the colour and variety of things hath so bewitched us, that we are not content with natural colours but we multimicate the Punick, Indian, American Waxes, and above those we must have green, dirk light, blew wax, made of Verdigrease and other paints, and some Turpentine.

Propolis the Arabians call Kur, the Greeks call it outsion, odiunits, seconds, done, the Germans, Vorflore, when Wachs, Wachs, winden, frop Wachs; the Helevetians, (if I mistake not) Bes, and mans, Vorflore, when Wachs, Wachs winden, frop Wachs; the Helevetians, (if I mistake not) Bes, and mans, Vorflore, when Wachs, Wachs winden, frop Wachs; the Helevetians, (if I mistake not) Bes, and so Virgins wax: Bylontiens fally takes it for the dongs of the Hives: Androne Bellumni, calls it for Virgins wax: Bylontiens fally takes it for the dongs of the Hives: Androne Bellumni, calls it for Bdellium. Some maintain that Propolit drops from trees, others say it is the first comb. It is indeed a thicker yellowish matter, sall passages are stopragainst cold and rain. The third fort is that black matter, and shap sented which Aristotle calls Mitys, Gara and Pliny call Commoss, the dregs of wax: the second is called which Aristotle calls Mitys, Gara and Pliny call Commoss, the dregs of wax: the second is called which Aristotle calls Mitys, Gara and Pliny call Commoss, the dregs of wax: the second is called mistotle between these two supporters and wax, laid very thick at the mouthes of the Hives, chiefly the between these two supporters and wax, laid very thick at the mouthes of the Hives, chiefly the Bees build with it at the doors before the Hive. Propolis (saith Cordus out of Plin) penaps the Bees build with it at the doors before the Hive. Propolis (saith Cordus out of Plin) penaps the Bees build with it at the doors before the Hive. Propolis (saith Cordus out of Plin) penaps the Bees build with it at the doors before the Hive. Propolis (saith Cordus out of Plin) penaps the Bees build with it at the doors before the Hive. Propolis (saith Cordus out of Plin) penaps the Bees build with it at the doors before the Hive. Propolis (faith Cordus out of Plin) Penaps the Bees build with it at the doors before the Hive. Propolis (faith Cordus out of Plin) Penaps the Bees build with it at the doors before the Hive. Propolis (faith C

is soft to be touched, and sticks like bird-lime, it smels sweet and comfortable to the head, cantech istort to be Storax, it takes like Poplar buds. The second is gathered from the Birch-tree, and is of a colour between a yellow, ash, and green, it is fost and ductil also inhandling. The third the Bees make out of the gum of the Poplar tree, called Alpina, but it is but feldom, and only in thole places, where no other Poplar tree or Birch abounds, but only that is called Alpina. The fourth or mingled, is gathered and confounded from all these trees, so that it hath a mix colour, fent, favour, and confiftence. Cordus faith almost so much; now let us hear Pliny. Propolisis a kinde of middle substance between honey and wax; rather between wax and Pissocros: and it seems to be gum collected by the Bees to stop up their hives. Rondoletine saith, it hath a thick substance, and the smell of leaven. Pliny saith, it smels so strong that some use it for Galhamm. But in the fpring gathering time of honey, this part that shuts their cells may be separared of which Politianus Writes thus: That the Bee laies a white foundation of his various coloured wax. So that Propolis seems to be a thick foundation for the wax. But it is now out of uses nor can any man finde pure Propolis. For most Bee-masters taking out the Hives, when all the honey is run forth, what loever is in the combs they mingle together, and keep none pure by it left; not is that wax which Avicen calls black Mum, any thing but the dregs of the combs, or elle tome rediment that finks to the bottom of the water after the wax is boyled, and this is now Propolis; but Propolis is not pure, but some mingled matter. The nature of Propolis, is to dislolve in oylas wax, but it is more ponderous and thick, and finks to the bottome of it being melted. when wax fivims on the top. Choose the sweetest, purest, not sophisticate with wax, which you may eafily part by powring it into water. The best Propolis is said to be pure, most fragrants without wax. That of Crete and Passidium is the most effectual, the Bees collect the greatest part of it from the unctuolity of Storax and Labdanum; they collect it queltionless out of other plants: for they make Propolis where neither the Poplar tree, nor Birch, nor any of the foreful plants grow. Great is the vertue of pure Propolis, upon the gross spirits, and it draws faulty marter out from the depth. Hollerius. It is of the nature of wax, but it powerfully drawes forth. Dioforid. Celfus placeth it in the number of biting remedies, faying that it digetts and moves matter inulcers. Actins fayes that it hears, discusses, ripens, cleanses, attracts. The cleaning force is not very firong, the attracting is strong enough, it is of thin parts, it heats in the second degree complete, or in the beginning of the third : you must first soften it with your hands before you mingle it with other medicaments, and then taking the rest from the fire, put it in and boylit, forit will not well endure any boyling at the fire. It drawes out thorns and all splints that are within. Actius. Varro faith, that for its manifold uses it was fold dearer in the market thanhorey. May be therefore Propolis was called holy wax, because of via sacra where they folditat Rome, as Largus writes in the cures of hard swellings. They draw forth thorns and such bodies slicking in the slesh, with runnet, (especially of a Hare) powder of Frankincense, and Propolis. Pliny. It helps an old cough with its smell. It cures the rose with water, and roots out ringworms by anointing them. Diorfcorid. It cures Ozanas: Serapio. Pliny 1. 11. c. 7. tells of more

Arifiale Calls Erithaca Sandatacha, others call it Cerinthum, and Smerion, I. 2. Arifiot. de Plant. The learned call it Vernilago; fome from the time of the year, Vernix; this Glew, faith Niphus, the country Lombards call Carbina, but ours Taram. It is the meat the Bees make, which they lay in the void spaces of their combs; it tasks bitter, it is made of spring dew, the juice of trees, and sometimes of gum. That of Africa smels little; that from the South parts is blacker; from the North is better and redder; there is much from the Grecian Nut-trees. Menerates saith it is a flower, that shewes the future harvest. Plin. Varrosaith, it is not meat, but glew, whereby the Bees sasten their combs at the ends together. It forcibly calls forth the swarms: where they would have the swarms light, they anount a bough with Eithaw, or any other place, adding balon. Virgil, Ithink, sollowing Varro, calls it glew. Myeiscommosis, (Stephanus calls it xosum) and Pissomo, cures strokes and ulcers. Aristotle. What we it hath in the hives, we said enough before.

CHAP. VII.

Of Drones and Theeves.

The Drone called in Latine, Fucus, is called in Greek, **nody* and *grovate, in the Illyrian frongue, Czara; in English, a Drone, a Dran; in High Dutch, Traen; Low Dutch, Belonder strain; in Spanish, Zangano; in Italian, Ape the non fa mele; In French, Bourdon, and Fullon; in the Hungarian tongue, Here; in the Polonian, Czezem. The word Fucus, a Drone, is derived as somethink from fur, which signifies a thief, because privily and by stealth he makes prey upon the honey: although with more probability the word fucus may be so used, because he doth cheat and cousen the Bees, and under colour of keeping the Hives warm, (which is his office to do) he instacks the combs. And for that reason, some with too much considence, perhaps, derive the Latine word fucus from the Greek word *avaus, signifying to eat or devour; others will have it some a fovendo, in regard of their sitting upon, and nursing up the young swarm.

The Die:

The description on of the Drone.

918

Some make the Drone to be'a fourth fort of Bees, but not fo well as others think, because he some make the Drone to be a fourth any way help in the working or making of it up. He is almost twice as big as the ordinary Bee, and somewhat bigger also then the Thies; he is as big almost twice as big astne ordinary Beckman Although they do not arrive at this corpulency, by likewife as the King, and somewhat bigger. Although they do not arrive at this corpulency, by the dispensation of nature, but by their course of life that they take. For when the Bee doth set apart cells for the Drones to breed in, they make them leffer then their own. And the little Schadowes or worms whereof they come are far lesse than those of the Bees (who are spring of the nodowes or worms whereor they come are tall their first birth; which at length become a great deal ble race, and of the stock of the Bees) in their first birth; which at length become a great deal ble race, and of the Hock of the Bees) in their list builty and being read their natural fibigger than the Bees, both by reason they never take any pains whereby to spend their natural superhuiries; and also in regard that they do nothing night and day but (like oxen at the stall) neperhuiries; ver leave glutting and gorging themselves with honey, which afterwards they deally pay for, ver leave gutting and goiging them. and there fals out a dearth. They have a bright finning co-Mey der N when provinon happens to be those and the Beess in bulk they exceed them all, but yet with more black than that of the Beess in bulk they exceed them all, but yet with They both breed and live amongst the Bees, and when they go abroad, they one iting and idle. They both offerance in as if driven by violence, where for a while they belief themselves, and afterwards return to the Hives with good fromachs, falling greedily to the homelves, and afterwards return to the Hives with good from themselves, and afterwards return to the Hives with good from the falling greedily to the homelves, and afterwards return to the Hives with good from the falling greedily to the homelves, and afterwards return to the Hives with good from the falling greedily to the homelves. new. But why the Drone should equalize the chief Bees in bigness, and the Bees also in having ney. Dut why the Dione mount quarter reason. Nature did desire, faith hey to put a difference strings as well as they; let us hear Aristotles reason. Nature did desire, faith hey to put a difference between them, that they hould not be all of one kinde, which is impossible; for so the whole Stock would be

the faculty of generation; and the Drones only in bulk of bignesse of body, to whom if you should give a fing also, they would be nothing inferiour to the Kings themselves, 1. 3. de gen. Animal. c. 10. They are called also of the Greeks ubsuess, because they hade their stings. From hence Hefod, hath these words, some diepos, Zash uneshield nobless example spunts, who lives idly, having strength like the Drone that never sheweth his sting; certainly either they have no sting, or never use it to revenge themselves withall. Plin faith plainly they have none, and terms them no other then in a manner imporfect Bees, and therefore Virgit calleth them ignavum pecus, a sluggish kinde

either Kings or Drones. The Bees therefore are like unto the Kings or Master-Bees in strength, and in

Suidas Calls them xollipus muest to xul sur the scullar vers, from hiding their sting. Columella, 2 fort of creatures of a greater growth, very like the Bees, and accordingly he placeth them in the rank of herding or fivarming creatures. They fuffer egregiously of the whole fivarm many times, not only for their floth and rapacity; but for that wanting a sting they seem esseminate, and not able to make any opposition. Plin. 1. 11. c. 17. describeth them thus: The Drone is an impersel Bee without a sting; and begotten then after all when the Bee is decayed with labour, not being able to labour any longer. Like as men past their labour, and stricken in age, beget of women when they have well-nigh left teeming through age and weakness, feeble children, uncapable of procreation, little better then eunuchs: fo it may not feem strange, how these Drones are too weak and impotent, being begotten of the Bees when they are exhausted with age and labour, informach that they are fit neither to propagate their one species, nor to take pains as the other do. Which is the reason why the Bees so lord it over them, for they put them first forth to work, & if they loyter, they punish them without mercy. For in the moneth of June, two or three (especially the younger fry) drag out one Drone by himself alone, buffet him with their wings, gore him with their stings, if he result them, they cast him down from the form upon the ground, and at length when they have made him weary of his life for anguish, they make an end of him and kill him, this I beheld with mine eyes, not without exceeding admiration and delight. Sometimes the Drones being banisht from the Hive, are fain to remain without doors, not daring to enter. Now for three reasons especially thereunto moving, the Bees do shut out the Drones: either when their number is above measure increased; or when there is not room enough lest for the Bees to work in, or else when their honey fails, and they are straightned for want of provision,

And as they bear a deadly harred against the Drones, so neither will they hurt any man if with his naked hands he shall take the Drones and cast them forth, no although they be

The Drones, if the King be alive, (as some affirm) are begotten in a place by themselves, But if the King be dead, they are begotten of the Bees in their cells, and those are a great deal luftier Kerrpa 78 30. than the other, in which regard, they are faid to have a fting in their fouls, although they are aless. Arift. I lowed none in their bodies by nature. Thus Elian. lib. 1. de Animal. Hift. c. 10. The Drone on hift. 1. de Animal. Hift. c. 10. The Drone which is bred among the Bees lies hid all day between the Landau Marketin and the libe high the high the lies he night when 9, hist. c. 40. which is bred amongst the Bees, lies hid all day between the honey cells; but in the night when he observes that the Bees are gone to their rest and are fast asleep, he sets upon their works and preys upon their Hives. This afloon as they understand (for that most of the Beesbeing weary with labour fall alleep, and some sew watch) when they espy the thief, they moderately and gently chastife him, crop his wings, thrust him out from thence and banish him. But not come thence and banish him. But not come thence and banish him. tent with this punishment, whereby to amend his fault, being naturally possess with two ill quality is ideases and larger ties, idleness and luxury, he hides himself amongst the combs. But asson as the Bees are gore forth to pasture, presently he falls upon the works, doth as much as in him lies, glus himself with honey, and utterly ranfacks the sweet treasury of the Bees. They coming home again from feeding, as foon as they meet with him, no more favour him as before, with easie stripes, or as they were about only to be the were about only to be the stripes of the str they were about only to banish him again, but setting upon him with their slings they wound the

Of lesser living Creatures.

felon, and no more fatisfie themselves with chiding of him, but then he payes for his yoracity and gluttony with no lesse than his life. This the Bee-masters say and personal me that

σύμβολος, μη-

very many of

Drones come forth without a King, the Bees never. For they alwaies descend from Kings, Their Ocne-There are that affirm, that the young Drones are brought thither from other places from the flowers ration. of honey-fuckles, or of the olive or reed: But this opinion is infirm, and doth not fland with reason. Aristorie affirms that the great store both of Drones and Theeves are sprung of the tonger and flender kinde of Bees, which doubtleffe he was informed of by the ancient Philosophers, or by Bee-keepers, and Honey-malters of his time. Some likewife lay they are ingendred of putrefaction; as of Mules, so Isadore; of Asses, so Cardane; of Hories, so Plutarch and Serof putters will have them to be the issue of Bees by a certain degeneration, when they have loft their flings, for then they become Drones, nor are observed to gather any honey, and being as it were gelt of their natural strength, they neither do harm or good. Others on the contrary fay, that the Bees are bred of the Drones, because long experience hath taught, that as the numher of Drones aboundeth, by so much every year is the number of the Swarms greater. But that in my apprehension is rather a seigned than a solid reason: for therefore are there not (as some seasonable years it comes to passe) more Swarmes of Bees, because more Drones are bred: but rather on the contrary, because the increase of Bees is more in regard of the clemency of the heavens, and the plenty of mellifluous dews, fo from the abundance of superfluous moisture proceed the greater store of Drones; as the Philosopher hath well collected. Or if we grant them this, that the more the Drones are every year, to the more Bees; yet nothstanding we ought not to conclude from thence, that the Bees should derive their original of being to the Drones, but rather are beholding and indebted to them for their conservation, whilest they at the time of fitting and incubation, by their company do much further the procreation of the Bees; the throng of them (to use the words of Pliny) exceedingly encreasing the vegetative heat, by which they are sooner hatched up.

There are that divide the Drones into Male and Female, and will have them to propagate Plin. 1, 11, 6.11, their species by way of copulation, although (as Athenaus writes) neither Drone nor Bee were ever seen to couple together. Yet forasmuch as Wasps and Bumble Bees, and all other Hivebom Insects, are seen sometime (though very seldome) to couple: I see no reason why the modesty of the Bee and of the Drone, whereby they abandon publick scortation and venery, should debar them of the private use of copulation. For they, as the chaster fort of men are wont, do it privately, and do naturally detest the impudence of those that publickly prostitute themselves in

the day time, and when all eyes are upon them.

We have told you before in the generation of Bees, that some would make the Bees the male, and the Drones the female.

But when as (about the time of making their honey) they do so sharply punish them after they have cast them out of their Hives, and kill them (such violence which if used to their mothers, would much blemish the virtues of the Bees) I scarse think they are females.

Of what use then are they of in the Hives? is the Drone altogether unprofitable, good for no- Accounts, thing, idle, without sting, fit for no service, no way helpful to the publick? More than that, Vir-allande, despots all himself changes it to the effect: gil himself chants it to that effect :

Immunisq; sedens aliena ad pabula fucus.

The Drone sits free feeding on others food.

Where Festus takes the word in that sense for a slothful, idle, unprofitable creature, void of them bave all imployment, unlesse it be that of theeves and robbers, who take such a course that either they will live by the sweat of other mens browes, or esse they will disturb the whole Kingdom. Such like Hessed makes women to be, when he compares them to Drones.

> 'Oid' Elbe utvolles imperias x7 ouches Andorgeor raudor spelephy eis jaség' a jubilat.

Which is, I interpret it in Latine thus:

Qui segnes resident contectio adibus, atq; Sudorem alterius proprium furantur in alvum.

Or, in English thus:

Who sit at home, and to work have no will, With others swear they do their bellies fill.

But more creditable Authors propound divers uses of Drones: for if there be but a few of them amongst the Bees, they make them more diligent and careful in their businesse, not by their example, (for they live perpetually idle) but became they take the more pains in making oney, that they may be able to continue their liberality to strangers. They discove: also signs Thereby to know when the honey is come to maturity : for when they have perfected their ho-

1. de Animal. 1. 6. 10.

Amentol.

ney, then they kill them in abundance, lest they should (as their custome is) rob them of it in the ney, then they kill then in admindance, left they are quietly in the honey cells, but in the night night; for as officer faith, the Drone all the day lies quietly in the honey cells, but in the night might; for as or han latting the Bees are in their dead fleep, he fets upon their works and destroits when he perceives that the Bees are in their dead fleep, he fets upon their works and destroits

their combs.

But yet (if Barth lomain deceive us not) they are not unbused neither; but they build houses But yet (it Bartin tomam deceive us not) they and middle part of the Hive very finely covered for the Kings, large and magnificent in the top and middle part of the Hive very finely covered for the Kings, large and magnificent in the top and Ariffords) in regard of making honey or gathering over. They are therefore idle (to fay fay with Ariffords) in regard of making honey or gathering over. They are therefore full (10 lay lay with Ally workmen. For as the Bees make the combs dew; but in regard of their Architecture to they are workmen. For as the Bees make the combs dew; but in regard of their British Court, so under the same consideration the Drones build the of the Drones hard by the Kings Court, so under the same consideration the Drones build the of the Drones nard by the Kings boules, which is the reason why they and their young ones (if they have any) are suffained Kings houses, which is the reason why they and their young ones (if they have any) are suffained Kings houses, which is the reason why they and their young ones (it they have any) are sustained by the Bees. The cells of the Drones now grown up according to the bulk of their bodies are larger, but their combs lesses, for the Bees built these, but those the made themselves; because it larger, but their combs lesses, and the sustained food should be allowed to hinder and their larger, our their comes removed to food should be allowed to hindes and hired servants, as is not fitting that the same proportion of food should be allowed to hindes and hired servants, as to the child en or masters of the family.

Chil. 8. Hift. 217.

Treezes in his elegant Poem, and other of the Greek Poets, make them to be the Bees cellar-Tzetzes in his elegant. Fochis, and of affign unto them a most kindly heat whereby they are said to men, or water-bearers, and to might the hard the property and the hard the young Bees and make them thrive. In like manner Columella: the Drones do very naten the young Bees and make them the first ing upon those seeds out of which they are made. And much help to breed the young Bees, by sitting upon those seeds out of which they are made. And much nelp to breed the young admitted to the nursery to bring up and cherish the young the ero e they are more familiarly admitted to the nursery to bring up and cherish the young the ero e they are those familiarity adminested they are thrust out of doors. And Pliny also in brood, which when they have done, attended the Bees in their Architecture only, but also in cherishing their his 11. Book. They do not assist the Bees in their Architecture only, but also in cherishing their young, the multitude of them causing heat and warmth, the which the greater it is (unlesse the young, the multitude of them causing ment the more the swarmes of Bees are increased. To conhoney chance to fail in the mean time) the more the swarmes of Bees are increased. To conhoney chance to fail in the mean time) clude, unlesse they had been for some great use for the Bees, Almighty God had never housed them under one roof, nor made them, as it were, free Denisons of the same City. Neither would the Bees lay hands on them at all as enemies of the State, but when their fervile multitude doth increase and they take up offensive arms, or scarcity of provision were to be suddenly expected: in which tempelt of affairs who would not rather judge that the Carpenter should be dismissed than the Ploughman? especially when without him by reason of want of victuals, we may than the Programmer, especially without for a time, without prejudice to our lives, hazard our lives, but the other we may be without for a time, without prejudice to our lives, and our selves (if need requires) are able to build habitations every one for himself. Now as these, being but a competent number of them, are very profitable to the Bees, so if they be over many, Plato not without cause terms them morbum alvearium, the Pest or Plague of the Hire, in the 8, book of the Common-wealth (where you may see a most elegant companion between Acolass m and the Drone) both because they waste the provision of the labouring Bees, as also with their too much hear stifle them. This inconvenience the Author of the Geoponicky doth thus remedy; take the covers of the Hives and sprinkle them on the inside over night with water, and you shall finde them betimes in the morning when you take off the cover of the Hives again all over covered with the Drones; for when their bellies are full of honey, they are very thirsty, and are mightily perplext with an intolerable desire of water; so that they cling fast to the lid of the Hive; and it is an easie matter to put them all to death, or if you will rather to take away the greatest part of them. But if you take away the young ones and all, that are not yet come to have wings, and pluck off their heads, casting the bodies in again to the other Bees, you shall offer to them a very dainty dish.

Moreover also if you shall take the Drone and crop off his wings and cast it back into the Hive, he will if we may credit Pliny, pull off all the wings of the rest, 11b, 21.c. 11. of rather the Bees themselves will devour the wings of the rest of the Drones that are lest. For to faith Ariftor. the uneffros to afser anousious don me, the holande dural the afseed doublem. For it is not probable that either the Bees should crop one the others wings; or that the Drones should so far adventure, or be able to offer such violence to the Bees: so that as Pliny was mistaken in reading wire for avral, so also they do not a little speak by guesse, who refer the words of All miles the

rest, to the Bees and not to the Drones.

But what the dreaming of Drones doth portend, what use they may be of in the way of Hieroelyphicks: let Apomafaris out of the Schools of the Persians and Egyptians declare. It shall abundantly satisfie for what we intended to speak of them, to shew their true use, true nature, generation, degeneration, description and name. But as for what belongs to Emblenies and Hieroglyphicks, and precepts for Manners; every mean capacity may furnish himself with a world of fuch like rules by observing their course of life; without any need of consulting with those abstrufe Egyptian Priests.

The Theeves are thought to be amongst the Bees of a kinde by themselves that are very big. Plin 1, 1, 6, 17 and black, bigger in belly than the profitable Bee, and lefter than the Drone. So called because Arihole calls they devour the honey by stealth. Bees admit of the Drone into their company, and are glad, for one, Hess of it as being helpful to them, for their benefit sometimes. But the Theeves being naturally chius objects, and from odious to the Bees, steal upon their labours when they are absent, wasting and spoyling their products of the Bees, steal upon their labours when they are absent, wasting and spoyling their products. the Laint witton of honey. Yea they do fo glut themselves in the mean, while, that they are not able manner that they are not able manner than the laint while that they are not able manner that they are not able manner than the laint while that they are not able manner than the laint while the mean, while the mean while ny times to get out again they are so full, or to stand in their own defence; whereupon the Bess name was de-at their return without any more adoe, severely punish them, and according to their just dements kill hill them outrights. Neither do they eat up the Bees food, but also privily lay their young in their cells, whereby it comes to palle oftentimes, that the increase of the Drones and Theeves is no lesse than that of the true legitimate Bees. Now these neither gather honey, nor build houses, nor take any pains, as the other Bees do, for which came they have watchmen which obferre at pight when they come home, and they defend and fecure them from the Theeves, and if they spie a Thief come in, they set upon him and beat him, throw him out of doors and there leave him for dead or half dead at least. For so it happens, that the thief having filled himself with honey is not able to fly away, but tumbles up and down at the door of the Hive, till they that go out and in finde him, and having branded him with ignoming and footh, deprive him of

Aristotle doth not tell us of any office that the Thief is good for: but I think that he was Their Use. nude for this end, namely, that he might pur an edge to the courage of the Bees in point of injuries offered them, and that they might be stirred up to more vigilancy and justice: for what use else do Theeves serve for in a Christian Common-wealth, who with incredible fraud lie in wait for the credit and estates of their neighbours.

CHAP. VIII.

Of Wafps.

THE Wasp is called in Hebrew, Tsirgna; in Chaldee, Deibrane; in Syriack, Gnarguitha; in Arabick, Zamber; in English, a Wasp; in Dutch, Harfell; in Italian, Vespa, Vrespa, Moscone; in French, Guespe; in Spanish, Vaspa and Abispa; Gothish, Boolgetingb; in Slavonick, Wols; Illyrick, Ofa; Hungarick, Daras; in Latine, Vefpa.

They are called Vefpa, as Calepine notes, for that in the evening they feek about for flies to

CHAP. 8.

The Greeks also have several names for them; commonly they are called somus, Entrathina the Greeks and five teveral matter for them; commonly they are caused sometimes, payrarmine derives of the sharpage, because you may perceive them to divided in the middle that they seem to gape, as you may observe in the figure set down. The Scholiatt of Nicander Calls them Authoration of Suidan, Minhi, and Minhis; Hesselm termes them duvided and mandages; see (but abusively) divisions, for they ought to be called rather Grabrones. Now the Waspis awinged Insect, gregal or hearding round like a ring, long, having four Description.

wings (of which the two former are the bigger) having a sting within, fix footed, they have no bloud, they are of a yellow golden colour upon black spots placed triangularly, the whole body is garnished with divers colours athwart, whence it may be Pollio called it Mazques.

I think they all in general are armed with stings, (what ever Authors write that their Femiles are without flings) because when I was at Hams a village town in the West, about the year 1587, having sound an entire Wasps nest, I poured hot water upon all the semales and killed them, and yet could finde none that had not a sting, either within their bodies, or

The body of the Wasp is bound in the middle to the breast with a certain exceeding thin thred, that they feem to have no loins at all, and to Arifleph. In be quite through open : whereupon that Greek Comick Poet calls those Pilot Maids, (which Terence by way of elegance calls Bulrufbes) for their flen-

dernesse in the waste commons, waspy or like Wasps. They make a buz-aing noise also like the Bee, but more loud and hoarse, especially when they are angry; upon which came that proverb made by Theocrisus in Hodaporis, in comparison of a bawling idiot, to aman of learning and parts, goal Boucon restore travilor, i.e. The buzzing Wasp against the Graf-

They do moreover erect for their children large tructures, (and as it were their nome and raining. They do more of a round form, floored, and standing one on the rop of like those Manifolea of the Egyptians) of a round form, floored, and standing one on the rop of the other. One of these fabricks most curiously built, was brought to Pierius when he was at the other. One of these factors find the Belinum out of a certain folicary grove. There were seven stories of building set one on the Betunum out of a certain tonically gives a cach of them, disjoyned by the putting of certain top of the other two fingers space between each of them, disjoyned by the putting of certain top of the other two ingers space between them, that there might be a convenient space lest to passe in and our columns or pillars between them, that there might be a convenient space lest to passe in and our of their lodgings. The diameter of the orbs up to the fifth flory about twelve ingers over, all of their roughlys. The diameter of the cop by degrees, so that the last is about five or fix the other from the fifth are narrowed up to the top by degrees, so that the last is about five or fix fingers broad. The greater round contains the first room, fashed to the bough of an old tree, very well fenced above with a certain rough-cast to keep off all wind and weather. Within are fix square cells standing very thick together; but the middle concamerations the multitude of Wafps had filled, a very thin leaf being laid over every hole for a covering, some of which when Pierins had taken away he observed all those chambers to be full of Wasps creeping with their heads to the bottome of them. Those in the rooms below were certain imperfect things like Embryons or little worms, which were covered over with the fame covering, as it were a winter Offer, in expectation of the more milde feation of the fpring. Which building although their fucceeded a very flarp winter did remain entire, and no way decayed; at length Pinim expe thing what should be done with these little worms when the Spring came, he perceived nature to make no further progresse in her work with them. But still the fabrick was kept by him, not without the great admiration of those that saw it,

wondering much to see so much art and cunning in those little creatures, and that they were able to hold out to finish such an elaborate edifice. This relates Pierius. I also have seen many such, but of a different fashion, some like a Harp, some like a Cup, some like a Pear, some like a

Toadstool, some like a Bottle.

The matter of their Combs is faid to be confused, heaped up together, like bark or cobwebs, transparent, gummy, and made into very thin plates like leaf-gold; but I found it alwaies light like paper, dry, easily pust hither and thither by the wind, and for the most part growing up from the bottom like a Turban. As for the place where they use to build, it is thought to be divers. If their chieftain be dead, they make their netts aloft in the hollow places of trees or wills, and in these as some affirm (though I never could finde any) they make wax also. But if they have their mafter Wasp, they build under ground in fix square cells according to the number of their feer, and after the fashion of the Bees. Their combs are made in the form of a large Toadhool, round, out of which there comes out in the middle or center as it were a little foot by which the cell is fastened to the tree, or to the earth, or to another cell.

But so tender are they over their mares or females, that they will neither fuffer them to take any pains, nor to feek after any provision; but they themselves bring in all necessaries to them,

and do as it were enjoyn them to keep at home.

All which things, and each particular being confidered by any man, he must needs confesse the pain, industry, cunning, sweat and labour of the Wasp. As for their choler and frowardnesse of the Wasp, not only poultrey that scrape in their nests and trouble them, but in like manner all that provoke them do know them to be implacable: from whence arose the proverb squite te-Henr, i. e. to contend with a Wasps nest. Of which fort something to that purpose was written on the Tomb of Hippocrates, who was systems or no unique vor, i. e. Do not rouse a seeping Wasp. to Aristophanes in Vespis, when he would expresse a cruel, morose, fretful, quarressome for of people, calls them Waspish, de Connouisus. Clem. Alexandrinus also, when he would set forth the acerbity and bitterness of those vices that lyo in wait for the souls of men, saith, sunga dilapartes Taxes of supposed, & μαλισι sides is extensive in wait for the fouls of men, faith, συμπρε αντραστικές αντραστικές διαμπρεολ, & μαλισι sides is extensive, are furly Olympick Antagonists and more tart than Wasps. To which may be added a certain speech of Themssiss disconting of the speeches of many male volume advertising sides. (Said to the speeches of many male volume advertising sides.) speeches of many malevolous adversaries, het ou (saich he) in tually of or to make the saich me control of the saich me contro wiver: they railed upon me as it had been a swarm of stinging Wasts. Which oftentimes proves more all as Physical backs that been a swarm of stinging Wasts. tall, as Phrynichus knew by experience from the Milesans, and the Phaselites were sufficiently in structed by their own great mileries: yea, who soever he be that shall challenge this generous and redoubted Chamber of the structure of the s redoubted Champion into the field (to use Nicander's words) shall obtain but Cadmus conquest, the shall small the shall small be shall small be shall small be shall small be shall small small be shall small sma he shall furely be worsted and slain; for they do not fight so much with their stings as with the strength of their hodies. Rength of their bodies, and more than that, when they fight they will never give over, being not only strong his reference. only itrong but resolute,

Sifom. 2.

Love to their

wives or fe-

males.

Notwithstanding they differ in their original, kinde, sex, age, place, dier, and labour.

If there affirms that Waspecome out of the puttered carballes of Asses, although he may be rence from mitaken, for all agree that the Searabest are procreated from them; rather am I of opinion others. Their diffewith Pliny 1. 11. c. 20, and the Greek Authors, that they are forms from the dead bodies of Harles, for a horse is a valiant and warlike creature, hence to that verse frequently and commonly used amongst the Greeks.

Trans de squar press, rapest of pararer.
Wafts come of Horfes, Bees from Bulls are bred.

And indeed their more then ordinary swiftnesse and their eagernesse in fight, are sufficient arnuments that they can take their original from no other creature (much leffe from an Affo, Hart, or Oxe) since that Nature never granted to any creatures elfe, to excell both in swiftness and valour. And furely that I may give another fense of that Proverb of Arifotle, Kalten Zustanilar walfiger lame, Hail the dang beers of the wing footed feed; this would I suppose fit to be spoken in way of jeft and fcom to scolding women, which do imitate the hastiness and stoward disposition of the Wasp. Other forts of them are produced out of the putrid corps of the Crocodiles, if Horm and the Egyptians be to be believed for which reason when they mean a Wasp, they set it forth by an Horse or Crocodile. Nicander gives them the name Auxomians, because they sometimes come from the dead carkasses of Wolves. Bellenacensis & Vincentins says that Wasps come out of the putrefaction of an old Deers head, flying sometimes out at the eyes, sometimes out of the nostrils. From Lib. 2. hence Cardan seems to have collected this observation, that out of the corruption of every creature, there is another fort produced; which would be very about 1. For by this means Generation would be infinite, and likewife daily experience doth teach the contrary. For that little beaff which I term Tatinum Alberti, doth naturally produce nothing at all, as I have tryed a thousand Albertis. times. There are those also that affirm that Wasps are begotten of the earth and rottenness of trad. s. some kinde of stuits; as Albertus and the Ababick Scholiast: but for the most part they are begotten by copulation, and the mutual embraces of the male and female; which although Athenans 1.8. dipnof. esteems as fabulous, yet when as the Philosopher affirms that he saw it with his eyes (as 1. 1. de gen. anim. c. 16. & 9. Hiff c. 41. it is evident) I am wholly of his opinion, and do give full suffrage to his affertion. But how after copulation, they grow and come to maturity, we may know of Arift. Hift. 9. c. 41. and Pliny his Interpreter. The master Wasps, when they have chosen them a convenient place under ground, in the chinks of maller or (which I have sim seen) in the thatch of houses; in the beginning of summer they make their nest; and they contrive thin little nests or cells (which the Greeks call opinioness) with A doors or passagen in which are besum worms only, not Wafps, which when they are grown up, then they make larger colls, and when they ome to have young ones, then they make more still, so that at the latter end of Autumn, you have many and large nests, builded; in which the chieftain or master Wasp (which is called the Matrix) procreates mame Wafps, but those of his awn fex; which also are begotten aloft in the uppermost part of the nest; in thelikeness of worms, but far bigger than the other, in four or more cells continued, or joyned one to anothe otherwise there would be no difference in their breeding, between the Master or nobler fort, and the ordinary Wasp. They let fall their sperm as the Bee doth at the sides of the cells of the comb, and soone them close to the wall or outmost part. It is not all alike in all cells, nor of equal ligness, but in some in L. II.c. it. equal and frange (faith Pliny). In some so big that they are able to siy: in others only Nymphs, covered with a thin membrane like an Aurelia: some also have them yet in the worm. The worms only have excretion in like manner as the Bees have. Their ferm or spann doth not fir at all whiles it is in the Nymph, and is covered with a membrane. In the same time of the year, and the same very day Im ball observe them to be of unequal growth, one flies abroad, another is only a Nymph; one is able to rileg tumble, another not able to ftir, a third is a little worm. All thefe things happen in the Autumn, ht in the Spring. They most increase at the time of the full Moon. Here then is to be noted, that the Walps have no swarms, and that all the Summer they are governed by their Masters or male Wasps, but in the Winter by their females. Afterwards the multitude of their issue being ichewed, the government fuch as it is, of thort continuance and weak, however, upheld with more just lawes, terms to the males. But yet notwithstanding their young seems not to be brought forth by may of Birth, faith Ariff. because it presently becomes bigger than a Wasp should be able to bing forth. A very sterile and empty conceit of so renowned a Philosopher. For what should have that Nature should not be able as quickly to perfect and increase that which is produced by a leaving the state of th by a legitimate buth, as that which is generated of purrefaction? Let us but call to minde the Ye regumate buth, as that which is generated or purietaction? Let us but call to minde the found ones of fowles, which may very hour time when they are once out of the shell, do get eather on their backs; how loon do they go, feed, grow, and come to maturity? and then we half eathy see the hypothess and improbability of the Philosophers Argument. The Mallet Walps are greatly increased in number, especially if there were great store of Walps, and a well ref the year before. Anison Mymphs, s.e. young Wasps, are somewhat long, like those they become Nymphs, s.e. young Wasps, are somewhat long, like those word in sells (swhich Hipper are calls word) and small nuts, which, full of dusts or wreather, lower the back, without seen, not creeping, but it were tumbling up and down and moving themselves from one place to another. When

an were tumbling up and down and moving themselves from one place to spotter. Wites

they have layed their young fry, they cover the cell with a kinde of a little thin skin as it were, they have layed their young try, they break, and two daies after fly about with Wings. An. which when they come to personal they one mildes the other ficite; the fierce kinde is very find mentions but two kindes of Warps, one mildes the other ficite; the fierce kinde is very forte mentions but two kindes of very and breeds not under the ground, but in ahoak, being rare, and breed in injountains and woods, and breeds not under the ground, but in ahoak, being greater, more freiched out, blacker, longer, having a fronger fling, and flingerh more freiched greater, more irretened out; placed; to be, than the milder do, and is armed with a greater fling than his body feems to be able to carry; than the milder do, and is armed with a greater fling than his body feems to be able to carry; than the milder do, and is armed with a groupe old, and when the tree is lopt, in the winter Ariftotle faith that they live till they be two years old, and when the tree is lopt, in the winter Aristotle taken that they live the time they be two years only and most commonly live in old walls they are seen to sly away. They lye close all the winter, and most commonly live in old walls

A fort of these I found once in a wood in Essen, not without great peril of my life, at such A fort of these I round once in a work at the and there a simpling, with my friend Penny and one time as by chance I carelesty wandered here and there a simpling, with my friend Penny and one time as by chance I careletty washed be prying into their nett; with which they being offended fervant attending us. I would needs be prying into their nett; with which they being offended fervant attending us. I would be with all the force they had, and but (as God would have it) all the Iwarm north out upon a forme spries of Brooms (with which we used to carch those Insects) we had carried in our hands some spries of Brooms (with which we used to carch those Insects) we had carried in our names former appears of fafety but for our fafeguard and defence, we had payed for our folly, not only with the hazzard of fafety but for our lareguard and determines, its market of the very middle of the wood, and a great while it was

Detore they would take purchase of Charimell hills amongst the stones I saw two forts of Wasps In the year 1582, on the top of Charimell hills amongst the stones I saw two forts of Wasps before they would leave purfuing us. on the year 1502. On the control of wants of wan very eagerly inguitable, the less trusted in their faction and multitude; for fix of the lesser structures are greater they fought with one of the greater, not in the air, but in the graffe. From whence I gather that the rought with one of the less of their honey or young ones, or perchance offer them some other greater did use to rob the less of their honey or young ones, or perchance offer them some other greater the me to too the fight, fo that scarse after two or three whole hours encounter, injury. Long and sharp was the fight, so that scarse after two or three whole hours encounter, and the Sun very vehicmently thining and scorching them, did they give over. For they are ve-

ry hot upon revenge, and long ere they take up the quarrel: fo boldly and furiously charging the enemy, that even Mars himself were not able to answer them, or match their valour; such à strong undaunted nature hath God inftilled into them, and such spritelike courage hath Nature planted in them. I once received from Vienna and Hungary two kindes of Wasps, such as you see in the Figure, their backs were variously coloured with a shining yellow black colour, the one had rough horns, the other smooth; both of them almost three times as big as the ordinary fort of Wasps.

The Wasps called Ichneumones, are less then the reft: they kill Spiders called Phalangia, and after they have done they carrythem in to their nests, and dawb them over with dirt, and so string ponthem do procreate their own species. Ariffor. Therefore they are called Ichneamones faith Niphus from their spareness and stendeness.

This kinds of Wasp I make to be all one with that spoken of before, building he ness in mudwalls, and such like places; before the entry or going into her hole she builds a porch of dire, the length of it about the breadth of two fingers, which within is emplaiftred over with smooth platsfer of the same dirt. Pseudospheon seemeth also to be a kinde of Wasp having no sing,

with a blackish head, having two cornicles of little short horns, great eyes, black, standing out of its head, a long forked mouth, a bulky breatt ftrutting out, to which on elther fide are three feet fastened, the shoulder thick and bunching out, the body long, flender, confiffing of many joynts, two dusky coloured wings, rough fett, and of the fame colour with the wings. There is a kinde of Walp called Laerra because it shings deadly, like the pissue of called. Parneys are a kinde of Wasp for called which experiences are a kinde of Wasp for called which experiences. eth grapes, (as Ariftonians relates) and terres for a prey to the Owls and Screetch-owls, as Alian faith.

Of the Waips as well wilde as tame some have no sting, (or at least make use of none) others have; the lesser and more feeble are those that want, which nother are able to diffend or defend. On the other they that have stings, are bigger, stronger, and able to them that have so be the Males, the other that have to be the Males, the other that have to be me that have so so the state of the males.

fling Females. Also very many of them that have slings are conceived to lose them upon the approach of winter. But this as yet hath not been my chance to fee (faith the philosophe). If you take a Warpahd hold him up and make him buz, those that have not fains do presely flock to him, which those that have do not; which is the argument whereby fome are to prome the one to be male; the other female. Of both forts fome are objected to couple together as the other hale; the other female. the fly doth. Moreover, (according to their fex) both kindes of them are divided into two loss. either they are marker Waspel or drudges and labouring Waspe the one is greater and more generated the other less and more petrish. The drudge or labouring Waspe doth nor live our a wear

Of lesser living Creatures. CHAP. 9.

vers, for in the midft of winter they all die; which is known because so soon as winter comes they grow stupid, and in winter there are none to be seen: the others, that is to say, the Lady Waips, are observed to hide themselves all the winter long under ground. For divers men when they have gone to plow or dig in the winter, have feen them, though no man ever faw

now the Female Wasp is broader, weightier, thicker and bigger than the Male Wasp, and but flow of flight; for by reason of the weight of her body she is not able to fly far; by which it romes to pais that they for the most part lit at home, making of a certain glutinous material which

the labouring Wasps bring to them, combs and cells,

No man ever observed these creatures to live long, for the longest lived, which are the Ma- Their Age. rices, female or lady Wasps, live not above two years at the most, the other cie every Autumn. Now whether or no the Female Wasps of the former year, after they have brought forth another broad of master Wasps, die together with the young Wasps, or whether it alwaies fall out to be fo, or whether or no they can pollibly live any longer time, many Authors leave undetermined. But the wilde Wasp is accounted to be longer lived than the tame, the reason is because those making their nests commonly by the highway side (from whence they are called is on the Home i. e. Highway dwellers) are necessarily exposed to divers injuries, which hasten them to their death. And yet that little time that they live, is made up in the frength of it. For if you takethem off at the head, and so again at the breath, they will continue a great while after, and putting forth their sting, will as shrewdly hurt any man that shall touch them as if they never had been pulled in funder, or were alive as before. Guillerinus in his book of Shell-fish, writes very confidently that they put off their shells and renew their old age every year: certainly (unless he dreams waking what he would have to be) this must needs be discovered sometime or other in their Nests.

Apollonius cals them of wolfers, Ariftor. 1. 11. c. 53. warold us, although they feed not Their Food. on raw stesh only and ripe Apples, but upon Pears, Pruines, Grapes, Flowers, and fundry forts of faits; also on the sap of hims, Sugar, Honey, and almost whatever-

They feed on flesh of Serpents, and then they sting mortally. They hunt after the greater Flyes, and spare not the harmlesse Bees, who do so well deserve of the Common-wealth of mankinde.

According to the nature of the place they live in, they differ both in shape of body and dif- The place of polition of minde; the trivial and ordinary Wasp being accustomed to the company of men and Wasps. attel, do feem to be more milde of nature; but those that live in woods and folitudes are more fierce; yea, infomuch that Nicander in one word calls them another, i. e. permiciofas, permicious and destructive. There are also, as Oviedue affirms, in hotter Regions, those that are more huntil then others, as in the Well-Indies, whereas they differ from those of these parts both in bigness and shape, so also in their venome. For so are they reported to be far more deadly then the English, French, yea or the Spanish or Barbary Wasps: such as these also, Olaus Magnus in his 22 Book, faith, are very frequent in some very cold countreys.

The use or benefit of Wasps is observed to be divers; for besides that they serve for food for The use of the

Castrels, Martins, Swallowes, Owls, Badgers, Chameleons, they are also many waies profitable Waip. to men, for they kill Phalangium the most venomous kinde of Spider, and they themselves are a plaister for their own stings. The Pseudosphe or wilde Wasp (especially that which is taken in the beginning of that year) being taken into the left hand and there held fast, Pliny commendeth for an excellent remedy against a Quartan Feaver, 1. 30. c. 11. Miraldus attributes much vertue to the distilled water of common Wasps, or decocted, for raising of a tumor in the place that is wisht with it; applied to the belly it makes it swell as if it had the Dropsie, by which trick whores use to perswade their sweethearts that they are with childe by them; and by this way they deceive many times very cunning and expert midwives. Mirald. Memor. cent. 7. from whence it may be concluded that their venome is exceeding hot and inflative.

The Fox also (a subtile creature) is said to prey upon the Wasps, on this manner; he puts his tail into the Waips nest so long till it be all covered with Waips, which he espying, pulls it out and bears them against the next slone or tree he meets withall till they be all dead, this behis done again and again till all the Wasps be destroyed, he sets upon their combs and devours

But men purfue and destroy them with other cunning. As thus, in the mean time that the labouring or working Wasps flee to the Elm, which useth to be in the Solstice or at Midsummer, to gather some gums material to work withall: the master Wasps remain in the Nest and sit upon their young, those they smother with the flinking vapour of Sulphur, Garlick, Reed, or such like; and throwing down their combs kill them with hunger. Now when they would preferre their Bees from being surprised by the Wasps, they set by the Hives side a pot with some little pieces of flesh in it: into which when the Wasps in hope of prey are entred, they suddenwhelm the lid of the pot upon them and kill them; or else putting hot water in at a hole scald them to death. Others hang a net before their Nests over a small Menow. Now the Wasps beng drawn by a natural and strange sympathy to the Menow (for no food more takes then than that) they are presently involved in the net, and so caught, and with casting on hot water are killed. As also they lightly spurt our of their mouthes oyl upon the grapes, fruits, sugar,

Bookl

CHAP. 9.

Of lester living Creatures.

honey, &c. which caufeth them either to fly away, or tafting the oyl, to die; fometimes they mingle corrolives with honey (as Mercury fublimed, Vitriol, Orpiment, &c.) which when they take, ears out their howels, and so they pay well for their gluttony and intemperance.

Pieferyntives . againft the finging of Walps.

Now if at any time by reason of the itinging of Wasps, the e arise pain, perturbation, swelling, redness, heat, nusteousness, and thirst; and not long after swouning (which happens when they redness, heat, nusteousness, and thirst; and not long after swouning (which happens when they have poyloned their things with feeding on venomous herbs, and Scrpents flesh) Physicians have have poyfored their rungs with recently or repell their flings and eafily one them, out a preservative and remedy, whereby to repell their flings and eafily one them. The found out a pretervative and remaind the sexcellent against the stinging of Wasps. Thus the virtue of Mallowes, and Marson addressed a sexcellent against the most walke and insurance the sexcellent against the most walke and insurance the sexcellent against the most walke and insurance the sexcellent against the sexcell witthe of Mallowes, and mathematical and against the most wurlike and injurious creature, with most fost and supple he b becomes a remedy against the most wurlike and injurious creature, with whose juice and a little oyl mingled with it, and the part anointed, doth either mitigate the whose juice and a nittle oyl marger the fing to enter, Plin. 1. 22. c. 179. So Avien, the Wasp, or doth not fuller the fing to enter, Plin. 1. 22. c. 179. So Avien, the Wasp, the wasp that is anointed with oyl and the nice of Matter. rage of the Walp, or doth not sugar that is anointed with oyl and the juice of Mallowes; for as faith he, will not come near any man that is anointed with oyl and the juice of Mallowes; for as faith he, will not come near any man trace Gareks use to say) is the mines of the organization of the fortal answer appealeth whath, and (as the Greeks use to say) is the interest of the organization of the organization of the control of the organization of the orga a fost answer appeared what was anger: so also in physicks we see those things that are most fife and unyeelding to be related and beaten off with the most fost things, as the Iron with seathe sythe Adamant with bloud, the ting of Waips, Hornets, Bees, with oyl and the juice of the s, the Agamant with blonds the his Silk-worm? which yet Aetim affirmeth being besten to-Mallowes. What is inore to anointed with it, is a prefervative against the stinging of Wasps; gether with oyland, the party anointed with it, is a prefervative against the stinging of Wasps; gether with oyland the herb Balm beaten together with oyl, if the Greeks may be crethe same doth the social and the the true, although dawbed over with honey, and born about, died. The stone Garatides, if it be the true, although dawbed over with honey, and born about, dired. Incitione Garatium, a Walps whatfoever, as Sylvaticus out of Albertus doth conjecture, doth fray away all Flyes and Walps whatfoever, as Sylvaticus out of Albertus doth conjecture. The like virtue doth. Mattholas afcribe superstitionsly, and too confidently, to the Iron that both the figure of the shell-tish Strombus graven in it.

The symptomes that follow upon the stinging of Wasps, are said to be these; they suffer all alike as those that are shing with Bees, to wit, smart, rednels, swelling, but the pain is more grievois and of longer continuance, especially if they chance to be stung by the citron coloured greater Wafps in a finewy and tender place, for then followes the Cramp, weakness of knees,

Iwouning, and sometimes death.

Remedies a. gainst the Waips.

Physicians have found our many remedies against the stingings of Wasps; we shall first speak of those we have tryed and which may challenge your acceptance, being confirmed by long experience. We finde that Warps applyed to the wound they made do exceedingly help it, being perfivaded to use them by Gilbert an English man. It may be that not the Scorpion only hath this vertue, but the greatest part of Infects have it also, if we should make trial diligently. Bur fany man be flung by venomed Wasps, (which is easily known by the wound of the part by raing and swouning, and coldness of the extreme parts) then give antidotes against venome, and open the place with a knife, or rather lay on a cautick; when it is laid open and dilated suck it forcibly, and taking some of the earth of the Wasps nest, make a plaister with vinegar, and lay it on the fore. Alio a Cataplasm made of Mallowes, Willows and Wasps combs helps wonderfully as we proved by the cornfel of Halyabbas. The North English men make a good plaister against the Ringing of Wasps, of the earth of furnaces, vinegar and flyes heads; it is worth its weightingold. Rubthe place with juice of Citrals, and let the patient dink Marjoram-feed 2 drams: or take juice of Marjoram 2 ounces, bole Armoniack 2 drams, with juice of fowre Grapes what may suffice; mike a plaister. Another; anoint the place with the Juice of Purstain or Beets, or with sweet Wine and oyl of Roses, or Gowes bloud, also with seeds of wilde Cucumers bruised with Wine, Galen. Barley meal with Vinegar is good; milk of the Fig-tree dropt into the wound, Bineot fea-water to foment the wound; give in drink 2 drams of the tender leaves of the Bay-tree in sharp Wine, which also will do much good in a formentation. Also drink the decoction of Marshmallowes with Pojca: apply Salt and Calves fat. Mallowes with Pojca is a principal remedy. Dia-Gorid. 1. 2. c. 42. Actim joyns an earth named Cimolia to these, and Clay, and Oxeding, and Sefamum, and many other things with Pofea. Oyl of Bayes drawes out the poyfon of the ling of a Wasp. Leaves of Marsh-mallowes bruised and rubbed on, cure the venome of Wasps, Drink a little measure of the juice of Rue or of Balm, with Wine : and the leaves eaten, and applied with Salt and Honey, or boyled with Vinegar and Pitch, are very good. Water-mints, Roleman, with Barley-menland Pefea, juice of Ivy-leaves, Golden flower, and Owles bloud, are excellent against the stingings of Wasps. Pliny 1. 32.c. 9. Galen praiseth Water-mints and the seed of it drank, and Centaury, if at the fame time you lay on Oxe dung for a plaister. Lib.de simplicibed Pater nianum. & lib. de Certaur. ad Papiam. A branch of the wilde Palm-tree, Endive rost, and all wilde Betony, laid on for a plaise profit very much. Also drink wilde Betony 2 drams with Oxymel. First, suck out the posson, then hold the part hur in hot water for an hour, then seep it sudden ly in Vinegar and fifth Pickle, to the pain is presently gone, and the swelling finks away, and the venome is pacified. One half dram of Marjoram feed applied fills the pain, or 3 publis of dy Coronae feed, or cool juice drank. Avicenna. Leaves of Night shade or Houleleck laid on at good. Also bole Armoniack with Camphire and Vinegar. Nits bruised with a little Vinegar and Castoram. and Casto eum: apply a honey comb, and presently hold the part affected to the fire, or put hot allow under in apply a honey comb, and presently hold the part affected to the fire, or put hold affies under it, and the pain will cease forthwith. It is good to lay on green Coriander, or of and after mingled. Rhafis. Savorey or Water-mints applied, and the feed of them dranks of the ledge Control of the juice of the lefter Centory drank in Wine is excellent. So are the leaves of river Basil, Mercary

Mandragore with Vinegar. Serapio. A snow ball put to the spindament takes off all pain, chiefly if it proceed from a Wasps stinging: soment the part with Camphire & Vinegaror oftentines with how-water. Take Opium, Henbane-feed, Camphire, of each alike, mix them with Rosewater or inice of Willowes, and apply it, lay over it a cloth wet in Wine. Ardonne. Take juice of wilde Mints Aurei 2, with juice of fowre Lemmons, make a julep. Also the Juice of the Arabian Thom, and of Marjoram help much. Messe. Water-lintels with Vinegar anointed. Aaron. Rub the part well with the finest leaves of Xylogaraster, that is, sweet Cods of Pliny, and the pain prefently ceaseth. The juice of Lettice dorn the same, or the juice of Dandelion drank. The Mud in the bottom of a vessel where water hath stood long, applyed with Vinegar, cures the Wasps stinging. Simeon. Foment the part with Snow-water till it be stupested. Fagunisium. Any new earth, especially Cimolin is good: Poly smeered on, as also Goats milk, cures Wasps wounds. nolder. Alcanna with Barley meal, and Vinegar, bound to the part, Nuts, the leaves of Walnuts. Blices, are very good; also lay on hot to the wound a Spiders web beaten with a white Onion and Vinegar, it cures. Constantinus. Rub the place with Sage and Vinegar, and after with Possa. Gnil. Placentinus. Lay iron on the part, or Lead fleeped in Vinegar. Gordonius. Apply Chalk in powder, and drink Mallowes seed in Wine and a little Vinegar boyled together. Varignana. His Bezon is Coriander taken with Sugar. Christophorns Probus, commonly called Honeste Nonius, commends Balm leaves bruifed with Posca or with Oyl and applied. Nonins. Sparagus bruised with Honey and smeered on, Flyes beaten and laid on, Savory, wilde Mints, oyl of Mongratica anointed, cure. Marthiolus commends Oxe dung laid on. Marcellus. Any man may finde these and a great many such like receipts, the storehouse of Nature and of Physicians affords infinite remedies and antidotes innumerable to your hand every where. The Remedies for Bees and Wasps stings are the same, only that one requires them somewhat stronger than the other. In the year 190, before the Birth of Christ, as Julius witnesseth, an infinite multitude of Wasps flew into the Market at Capua, and fate in the Temple of Mars, they were with great diligence taken and burnt for lemnly, yet they did foreshew the comming of the enemy and the burning of the City.

CHAP. IX.

Of Hornets and the Tenthredo.

THey are called in the Hebrew, Thirdah; in Arabick, Zabor, Zambor; in the German tongue, l ein Hornaus horlits froisen pferzwuhle; in Brabant, Horsele; in French, Frestons, froisons, sulons; in Italian, Colauroni, Crabrone, Scaraffon, Galauron; in Spanish, Tabarros o moscordos; in the Slavonian tongue, Sierlern; in Illyrian, Irffen; in English, Hornets, Great Wasps; Hungarian,

The Greeks call them defferas & defferes 3 because with their sting they raise a Carbuncle; They are called in Latine Crabrones, perchance from the Village Crabra in the Countrey of Tusculum, (where there are great store of them) or from the word Caballus, i. e. a Horse, who is said to be their father. According to that of Ovid. Mis. 15.

The warlike Horse if bursed under ground, Shorely a broad of Horners will be found.

Albertus talls it a yellow Bee. Cardanus will needs have them to arise from the dead Mule. Plutarch in the life of Cleomedes, faith they come out of Horse Best, as the Bees do out of the Oxe his paunch. Now whereas they are more melancholy and fullen then the Wasp, why should I not with Virgil say that they are produced of the Asse; whom we have seen not only to sight with the Horie, (when as the semale or she Asse would be backt) but also to chase and overcome him often times. I conceive that those are produced of the harder shesh of the

Horse, and the Wasps of the more tender flesh.

The Hornet is twice as big as the Wasp, and very like it in shape; they have sour wings, Their Dewhereof the two undermost are twice as little as the upper or outermost, the which are fastened scripton; to the shoulders, being of a dark brown and Chesnut colour, and with which they say very swiftly. Six seet they saye of the same colour with their breast and shoulders, their head long, of a yellow hew; their eyes hanging out in fashion like a half Moon, between which grow two home like a solution and solutions are the same colour with their breast and shoulders, their head long, of a yellow and solution and solutions with the solution and solve the same colour with the solution and solve the same colour with the same solution. like a tekle or reaping book of the same colour with the feet. The belly is made fast to the shoulders with a small thread; of which the one half is of a duskie colour, and begin with a girshoulders within sittall thread; of which the one stall is of a duskie colour, and begint with a guide of Saffron colour; it is other half seems to be all Saffron colour, set with five dark colour specks, together with a small triangle, shaving moreover on both sides of them certain joynts, by which they can contract or extend themselves at pleasure. On both sides of the belly they have some black spots, and their tayle is armed with a long, shiffs and exceeding venomous sting. As they shy they make a numering and immining noise far more house than the Wasp. Who notwishinding they are gregal or heateling creatures, are sierce and cholerick, and alwaies of a wilde nature for some still be sufficient to safe sufficient to safe still be sufficient to safe still be sufficient to safe still be sufficient to safe su

twenty seven strokes they will kill a Man, or a Horse, especially in the Dog-daies, at which time their nature is more hot; and men are more weak by reason of the abundant exhalation of the

spirits. No wonder then that in sacred Writ they are compared to most cruel enemies, Exed. 23. 28. So Ovid. Metamorph. 11. Spicula Crabronum ardentia, the fiery datts of the Walp. And Vergil in the 4 of his Georgicks calls them afperrima, very tharp. Terence in his Phormio: Planens in his Amphieryo use that Proverb, Irritavi Crabrones, I have stirred up a Hornet, to shew the nature of women when they are angry, the more you firive with them, the more you provoke them, and at length go by the worst. Now as amonght Bees both the Drones and the Kings or Mafter-bees have no sting, and also some Wasps, (as we have said before) so amongst the Hornets there is not one but harh, both those that are in trees Master Hornet but hath one. For the Horners as well as the Bees

Aria. 148.1. 9 and those that are in the ground, not formuch as the Captain or Arif. bif. 1.9 and Waips have their Commanders or Master Hornets, what ever 6.42.

Pliny 1. 21. c. 11. dreamt to the contrary; only they are bigger than the rest according to the proportion of Horners to Horners, then Waips are to Waips, or Bees to Bees. They do also remain within doors as the Matter Waips do, but they never breed but one Malter Hornet of them in a Neit, for fear of tumults and taking of

parties; but as they are very troublesome, and fatall to those that from without annoy them and feek to spoyl them, so they are very strict in preserving domestick peace and quiet, and in keeping of mutual fociety one with another, and in providing for their young they do even outstrip the Bees themselves; for they never quarrel about priority of place, nor diftract them with divertity of imployments, nor make a ftir or tumult about the election of their Chieftain or Master Hornet, but all have one and the same employment, and they all dier together, what foever prey they take, or small creature they kill abroad, they carry part of it home to their fellowes, and young ones.

Neither do they every year fend out and expose to the wide world their young ones as the Bees do (and for which they are censured as in that respect unnatural) to finde out an harbour where they can for themselves to dwell in: but all their new brood they nourish and bring up in their own bosome, and as need shall require build more and bigger ness to keep them in. As for their King or Matter Hornet (whom also they dearly love and respect) such a one they have that doth appear not to want power to command, but occasion to exercise it. Only he excels the rest in courage of minde and bigneffe of body (as it is usual for Princes to do) for he is more herce than any of the rest when he is to encounter with forein enemies, as he is on the other hand most milde and gentle to his subjects at home.

The Horners make their nests under ground: casting up the mould as the Pismires do. For neither they nor the Wasps send out young swarms as the Bees do (as is before said) but as the young are bred there they remain, and so they dig their nests bigger and bigger, as the samily growes greater and greater. They make their nests exceeding large; we took 3 or 4 baskets full of combs of the luftier brood: they have very little or no honey in their cells; a drop or to

where their young are.

If any of them chance to wander from their nest, they gather themselves together into some tree, and there make their combs in the top, which oftentimes are easie to be frent in which they procreate one King or Master Homet, who when he is grown up, leads away the whole moop

and provides them a neit with himself.

The wood or wilde Horner (faith Pliny) live in hollow trees all the winter, like other Infects they lie hid, they live not above two years. Their fling is feldome without a fearer, cautch a earbuncle tumor, and exceeding great pain. They build their Nelts far more artificially than either the Bee or Wafp, sometimes in the hollow trunks of trees, or else under their roots in the ground, which they make bigger and bigger according as their family increaseth, and curiously platter over with a kinde of slimy spittle gathered from gummy leaves. The mouthes or passages of their cells are never upward, but altogether downward; and they very providently place the bottom of their cels upwards, that the rain may not pierce through them, or left otherwise they floud be exposed to the extremity of wind and weather were the head above. All their ness in a manner are exactly 6 fquare, the front or outside whereof is beset with white and justy iron coloured segments; the matter of them is membranous, much like pieces of Beech-bark, when it is rolld together and shrievel'd up with heat. Whilest Penniss was at Peterbarough in England, he saw in the wide open freet a Horner pursuing a Sparrow, whom when he wounded with his sting he fell down dead to the ground, and with the admiration of all that beheld them, he fuck't out and fill'd himself

Concerning the Copulation of Hornets Ariff. knew nothing of certainty as neither from whence nor how they are bred. But for as much as they do for certain lay their young at the very fides of their relies as they do for certain lay their young at the very fine them forth. But if they do couple, they do it in the night, as Cars do, or in some se CHAP. 9. cret places, out of all possibility of being feen; where wirge himself should not estie The Homet doth not feed on flowers, but lives for the most part on flesh: and rather then fail, oftentimes they will stoop to dung and excrements. They hunt after great flies also and the

smaller birds, which when they take, they first would the head as the Hawk doth, and then pluck it off and fly away with the rest of the body. In the winter they die many of them: because they do not as the Bee, lay up provision beforehand, but only live from hand to mouth regarding nothing but their present necessity. Arist. 1.3. Hist. Moreover, as Landing observes; they warch about the Bee Hives; and getting on their backs use them in stead of a Coach or Chariot to carry them; for when the poor wretches strive to fly away, they carry a most cruel rider on their backs, who when he hath fuckt out all the juice that is in the Bees body, is the most ungrateful of all winged creatures he kils and ears up him Which supplied his hunger. Also all sweet things whatfoever the Hornet will feed on: infomuch that I have feen him with mine own eves to eat of graffe worms. But the Indian Hornets have such a vast appetite (as Oviedm witnesseth) that they will light upon Oyl, Butter, Cakes, Sawce, and all liquid things whatfoe ier: not foaring nipkins or table-clothes, which they will consputeate and defile with their filthy excrement, and laying of their flimy eggs. Now as they feed upon what they got from others, fo they do not want one to prey upon them likewise. Above the rest the Brock, who about the full of the Their His. Moon enters their clens or nells and destroys both house and family. Nor are they food for this nfeful fat creature only, but they serve the countreymen by way of prognostick, to foreshew the alregation of weather; for if toward the evening they are icen to fly about in greater flore then ordinarily they are wont to do, it is a fign that the next day will be fair and hot : but if about twilight they often enter into their nelts as it were to hide and flielter themselves, then expect rain, winds, and stormy weather to ensue. Upon which Avienus thus:

> So when you fee troops of boarfe Hornets fly, Late at the end of Autumn, they foresberr, When first Virgilius stirs the evening skies That storms at sea shall presently ensue.

Morever whereas the same Medicines that cure the stinging of Wasps, will prevail also against Remedies as the flinging of Horners: yet as Aggregator hath taught us, a Horner is the Bezoar stone for its own gainst the wound laid on with Poscas, Oyl, or Oxe dung; Also Bole, and all fat earths are commended, such Horners, who was stung with Horners, whilest he risked their nest for honey supposing they were Bees: Ovid describes it neatly in a Fastor:

Thousands of Hornets his bald pase torment, And with their stings they wound his ugly face, He fals, and cries for help, a foul difgrace; What remedy, it was too late for to repent.

When that the Satyrs came, & found poor Silenus, His face all swoln, and balting on his knee, They could not choose but lange Bacchus said thus, Noint it with Mud, it prov da remedy.

He that defires more femoralies against the Aing of the Homer, may finde of them plenty in the story of the Wasp. For Airthors do seein to make them all one, only with this difference, that in this call they ought to be given in greater quantity, and the use and application of them longer continued.

Now let us proceed to the Infelt called Tenthredo.

Whether it ought to be called mighthur, mighthur, & mighthur according to Arifforde, or muspidous in Alexing. according to Nicander, let Philosophers judge; they seem to me to differ only in name and bignesse. For whereas the Scholiast of Nicander Cals it insettum opniones an Insect like a Wasp, I do not weigh that, when as ever and anon, by Poetical licence, he cals the Wasp, agem Croceam, a yellow Bee. What name it hath in other nations I know not, and (to fay the truth) nor know the little Beaft it felf. Only this I finde, that Authors describe it to be in colour like a Wasp, likea Bee in bulk or bigners, and in communication of labour like all other focial winged Infects, He is very fawcy, loves the kitchin well and fish, insomuch that some think it should be written nothing in stead of resolution and resolution, because it signers so much to Licorishnesse. Hospitaling cals it dreian williams, a wood or wilde Bee. Hermolaus thinks they should rather be called diffusion or despending, rather than mysenthing, as he saith it is corruptly read in Aristosle: He makeshis nest in the ground as the Wasp doth, with many rooms very large and handsome. Pennin will not by any means yeeld that the Pemphredo should be the same with Tenthredo. Femphredo (as the Scholiast of Nicander describeth it) gate in meanthing matters, and it recombines "office, i.e, the Pemphredo is very like the Bee, but the Tenthredo like the Wasp. But yes notwithstanding the Scholiast forgets himself; who writes also of the Pemphredo after this manner: Pemphredo is an Insect like a Wasp, it hath a sting, is greater than a Pismire, but lefte than a Bee; it hath wings, and a various colour tending to black; in fair weather it gathers inflenance from the thrubs in the valleys, then it flies and laies it up in the hollow oaks.

This Infect Haunteth woods and mountains, gathers honey juice from flowers, and layeth it up

Kkkk

Their place

in a hollow oak as being his Repository for the sustentation of his life; but honey he makes none, wherefore they differ in no other thing but in bignesse; rightly termed of the Poet, Parvala wherefore they differ in no other thing only and especially by that mark from the Ton-Pomphredo, i.e. a small Pemphredo: as degenerating only and especially by that mark from the Ton-thredo. Of winged Pismires, we shall speak in the Chapter of Ants. And this shall be sufficient thredo. Of winged Phillines, we maintiple as are focial and five cogether. Now we shall hitherto to be spoken of winged Insects, such as are focial and five cogether. Now we shall numerto to be spoken of winged interest infects, or fuch as live feverally by themselves. Amongh these solitary ones, some there are that have nests, as the young Drone called Sirm

Amongst these solitary ones, some there are that have no nests, as the Flys the Granthe Drone called Bombylius, and the Bombyw; others that have no nests, as the Flys the Granthe Buttersty, the Mothsche flying Glow-worth. This exhat build nests, are the Sirenes of both kindes, so called by Enstating, on suppose and principle of the context of the co fo called by Enfatum, on superson man as than fea Monster, Ministenges, because with his pleafint noise and buzzing he doth as it were tickle and charme the dar and not unfitly with 78 offer, because they beat and flutter in the air with their wings: 11 short live rou

Of the Siren there are two forts, the one lette all of an duskie colour; the other bigger black mixt with other colours. This fort Penniss referreth to the species of the Wasp, and to he describeth it in his drafts. All the body black, except the back, which is reddish from the middle almost to the tail, the extremity of which being black, hath filver coloured wings affixed, the former twice as big as the other: they harbour in wals, and in the brinks of ditches, and ruinous

buildings; whether they have any fting, or no I know not.

The Bomby is so called and to Bincer, because they never flye but they whirle and turn round in their flight: whence the Greeks call Topps or Wheels, Bincing. It is a creature refembling the Wasp, of a black hue, having a sting like as the Wasp hath, but stinging so deadly, and with such force, that it leaves the weapon in the wound. As a remedy to this Nicander commends the Pine tree Gum, and the unctuous honey of the Tenthredo. Parmeni in his Iambicks makes mention of this creature, which in the time of vintage useth to eat the ripe Grapes. Another of this fort is found in Assyria, but of greater bulk. Some of them build their nests spire wise out of clay like to glaffe or falt, fastening them to a stone or such like thing, but so hard and thick that you can scarle pierce them with a dart. For these they lay and bring forth little white worms, covered over with a black membrane; in another membrane they make wax in clay, much paler in colour and in greater plenty than the Bees. So Aristotle and Pliny. Who indeed were very sparing in their relations concerning the Tenthredo, Bombyx, and Humble Bee; either because their nature was not fowell known to the generality of the Grecians, or rather because they themselves were not so well vers'd in their History.

The Bombylus, greatest of the nesting Insects, is bigger than either of the Sirens (spoken of be-

fore) he hath his name from the humming noyfe he makes: for the word Bou-Buniden fignifieth as much, to make a humming or buzzing noise: forwhich cause he is called by the Germans Hummel or Humlen, in English a Humble Bee, as you would fay a founding Bee, the name being taken from the noyse they make: from whence (as the learned Turnebus notes) the long pipes are called Bombyces from the hunming found they give.

aund, and Theophraffus cals a reed fit for these kindes of pipes Bousuar. They are of little or no use. Infomuch that the Greeks use to call an idle unprofitable man, Southister argemen, i.e. a man no better than a Humble Bee; for such is this kinde of Beceven of no use at all. Neverthelesse one Antisocrations, to shew his wit, hath taken a great deal of mains to set forth the commendations of it. A cup with a wide mouth making a great noise as they drank, was in great request with the Ancients; that so, not only the brain might be intoxicated with the liquor, but the ears also with the greatnesse of the noise. They breed under stones hard to the grounds they build their ness sometimes with two doors, sometimes with three; in which there is found a beginning of a certain course Honey, and that (as Albertus relates, and Per nius faw) not of any great quantity; who once found to much as he could fearfe hold in three handfuls. The English Fhumble Beeshave not all stings, only some sew of them, but those that have do fling grievously; the honey they make is not very sweet, and withall some what waterish They fasten their wax as the Bees do to their hinder legs: they couple tail to tail, in the mean while holding fast by some plant or tree, they continue long in the act of venery, and all the time clapping with their wings they make a harfh noise, as if they were singing a Bridal song.

Of leffendining Creatures.

CHAP. X.

TN Hebrew, Zebub; in Arabick, Dubene, Aldubel; in Illyrian, Muscha; in Spanish and Icalian. Moles; in French, Monfehe; in High Durch, Flieg. m' nek; in Low Durch, Vliegh murge; in English, a Fly, from flying or scaping aways for it signines both; in Scottish, File: in Greek, uila and To utilen, that is, to futk deeply, or to mutter, the Fly doth both. Latine, Musca.

Not as proceeding from Museus Moss, as some do fondly dream, but from Museums a muscle: for raking off his wings you shall see that his head is full of sinewes, his body foft, his tail rendinous. Hence the diminutive muscula in Boethins, who thus elegantly cries out, Quid homine imbecilling quem morfus muscularum necas? VVhat so frail as man whom the smallest Fly is able to bite

Now the frame both of its body and minde we describe thus out of Lucian and others. The Description, great Fly is the least of winged Infects, infomuch that it may be compared to the least Fly or Flee:

only he is fo much bigger than they, as the Bee is bigger than he.

Itharh wings, not fuch as other things that flie have, but made of little skins as the Locusts, Grashoppers and Bees are, but a very great deal foster, as an Indian Garment is softer than those of Greece. It any man observe the Fly when he opens his wings in the Sun, he may perceive them painted with variety of colours, as the Peacocks are. He doth not flie straight forward, as the Bats do; nor skipping as the Locusts, nor making a noyse as the VVasp; but winding in and out to what part of the air foever he pleaseth to move himself. Neither doth he flie quietly and in silence but with finging and melody; not so hard hearted and cruel as the gnat or little Flyes, not as Bees and Wasps with a grave harshnesse, making a horrible and terrible murmuring: yea so far doth the Fly exceed all these in sweetness of sound as he slietly, as the small Pipe doth the Trumpet and Cymbal, or as still musick is sweeter then the loud.

He hath a very little head bound to his neck, turning every way, not compacted and fastened to his shoulders as the Locusts is. His eyes stand our very much, thining as if set in hom. His brealt is very firm and well compacted. He hath fix feet growing out of his body, not as the Wasps fall bound or tyed to it; he goeth only with four of them, the other two so emost serve in head of hands 1 as you fee him commonly go upon four feet, in the other two holding up formes thing or other that he hath gotten to feed on to his mouth as men do, and as we do. His belly is funder answerable to his breast, having broad girdles and scales. He doth not sting with a sting as The commenthe Bee and the Wasp do, but with his mouth and mout like the Elephant, and he eats and takes dation of the upthings with it, and sticking in a concave vessel he holds it in the top of his front: out of this Fly. comes forth a tooth, with which he pricks or bites: he drinks nothing but milk and bloud; the which he draws forth of those he stings with very little or no pain at all, but only with a kinde of utiliation or tickling. The light, like Truth, he doth exceedingly recoyce in, and doth behave himself honestly therein and civilly. Yea the Fly doth so covet the light, that many times with the Spider or Spinner he loseth his life for his pains; at night he goes to rest (as honest folk use to do) and makes no noise. He does nothing in the dark, counting it unbefeeming for him to do any thing privately, or to be guilty of that fast which if done in the light would be a difgrace and displinagement to him. I can affare you it is no little understanding that he hath also; whereby he doth escape the wiles of his treacherous enemy, the Spicer: for he marks him as he lies in wait for him and looks upon him, and so declines his force lest he should be taken in his nets and be destroyed. I must not speak of his prowesse and valour, for in that he may seem to surpateman himself. Homer the Prince of Poets, when he did endevour to set forth and commend begallantry of the bravelt noble man, doth not compare his strength to that of the Lion, Leapud, wilde Boar or the like, but to the undannted courage and confidence of the Fly. Who although he be never to often repullt and bearen off, comes on again, and bites as close as he did before: yea such a strength he hath with him, that he will not wound the skin of a man only, but of in Oxe of Horse: yea the Elephant also when he gets between the wrinkles of his skins, he will hewelly ver him, and according to the bigneffe of his mout gaffi and wound him : when he bites, the not out of multicity or clownishings to get bloud only; but by way of love & humanity, & for that reason especially he seiseth upon the fairest : yea what a pretty thing it is to see a company of Flyes Tying to and again playing and sporting one with another, and hanging upon a thred as it were dincers on the ropes?" Moreover as the cleanly horse doth, the lates her ordure all in one places so that opper washicot and felling of the rooms where they use are all full of great spots which they this orthur occasion, which is an argument that they are not altogether void of some kinde of themory alle. Treeserfaith moreover, that futh is their love to those of their own kinde, that they bury their delad corples. Elian doth as much discommend them as Lucian commends then anothe invelops against their proceedry and sauciness; which is such, that being driven may never to ofteny they notivitherending recurrivith fresh assaults. He blames them likewise fortheir impudence, in that dies couple in publick, and know no end of their Venery almost; Milhor do they as the Cocks when he once high tradden presently fals off, but is born upon the

back of the female a long while, and she carries him; they sly away together into the air, yet back of the female a long willies and the Alexand Pennins Caught two Flyes in the Act, and thut them up are they not fundred with flight. Learned Pennins Caught two Flyes in the Act, and thut them up are they not undered with hight. Leathers that stage they not then up in a box, and the next day found them together ftill in the same posture; which doth much continue years long in the same posture in the same posture. in a box, and the next day found from the flyes do continue very long in the act of ge-firm what Arift. Alian and Niphus fay, to wit, that Flyes do continue very long in the act of generation. Plusarch faith that the Moule and the Fly are indoctle and unteachable creatures, who neration. Piutaren lattit that the thomas the same daily; are by no means tamed, neither do they she whe although they me the company of their dary, mad for what they receive of any man: both of least courtele, or the least they of a grateful minde for what they receive of any man: both of least courtene, or the least line of a grant and the care of them are by nature very suspicious, alwaies fearful of treachery, afraid to be caught. She is altogether idle and carefelle, feeding upon the Jabours of others, and where ever the comes the hatha gether idie and caretene, recting upon that and the Bee bestowes her pains as much for her as for full table. For her the Goats are milked, and the Bee bestowes her pains as much for her as for any other; the Cooks provide Meffes for her, the Confectioners Sweet-meats, the Apothecary syrups, and these she castes before Kings, and walking all over the table she feals her self with them in their company, as also with all other whatsoever. Plantu took her to be of no use inhis them in their company, as also with my conceit you are a kinde of Lions among st men, as Flyer, Gnate, Curculio, where he thus speaks: In my conceit you are a kinde of Lions among st men, as Flyer, Gnate,

Somlice, Fleas, that do much hurt and do no good. Well therefore did Nature take care, that the should have no certain place to dwell in, as howell therefore and reaching as no neft folks have, but should wander up and down, where she could get her a lodging and travelnelt tolks have, out moule value up and the ling harbour. But in impudence the goes beyond any begger what foever; because they having had once a denial are therewith fatisfied, but this begger will take no answer, but will fill his unprostable gut with the best cheer in the house whether the master will or no. Aristaphon in his Pr thagorifta recited by Athenaus, brings in an impudent Parasite speaking on this minner:

Conis etiam non vocatus, ut musca, advolo.

I hasten to supper as the Fly, without any invitation.

Some such like matter Socrates upbraids Theodate withall in Xenophon: wherefore the Egyptians being to fet forth dishonesty and impudence together, they made the picture of a Fly, as Orus faith. Whence it is, that Cicero (if I be not deceived) faith it was faid formetimes by way of jest concerning a troublesome impudent youth, Abige Muscas puer: Boy beat the Flyes away. To this so peltilent a little beast Nature (as meet it should be) hath denied long life therefore. For as foon as winter begins to come on, the greatest part of them expire; and those that escape starving, in clifts, wals, hollow places, ovens and such like, they lie all the while weak and languishing, and not able to hold out another winter. All of them are begotten of filth and natinelle, to which they most willingly cleave, and resort especially to such places which are so unclean and filthy; unquiet are they, importunate, hateful, troublesome, turnultuous, bold, sawcy. Homer amongst the battels of the gods and heroes elegantly descants upon the baseuesie of the Fly, who like the Mouse, alwaies hath his hand upon another mans trencher.

> The Fly, though often forced from your skin, Tet she returns again, shee'l never lin.

Yea Solomon himself thought their nature to be so bad, that he saith in his Proverbs, that one of them is able to spoil a whole box of ointment. To conclude, the Hebrewes to set out the Prince of Devils, called him Bahalzebub, i.e. a Fly: which useth the same diligence, and never leaves of doing of hurt. Which is the reason that Witches and Wizards will have their Familiar to be alwaies in likenesse of a Fly, using the body of a bad creature to far worse purposes. I could at ledge much more a great deal than this against the Fly, if I desired the name of Antilucian, with whom it is a disparagement for a Chillian to contend, year or to meddle withall, more than with the most loathsome carkasse. Neither will it be more disgrace to me to make nothing of a Fly, than for Lucian to make him an Elephant: both indeed being but loffe of time, and vain often tation of wit. But yet nevertheless that lest like the Eagle I may seem to contemn flies, or to neglect the least of Gods works; I shall with all diligence fet down the Generation, Difference,

Flies are generated two waies, by coupling with their own species (which is done in the time and Use of Plies. mer feafon, and in the winter if the weather be fair) or by the purrefaction of other things. The Flies use copulation, some of them dispatch the work sooner, others after some space of time: the minner whereof (as Arif. affirms) is divers from most of the other Insects; for when the male ascends the female, he takes the member of the female (that is stretched forth to seek for feed) into his body, the which being accordingly received he furnisheth with matter and strength to bring forth. Reverend Pennins fawtwo Flyes at Hedelberg flying in the act of copulation, who (as it had been the fon of Mercury of Venus) seemed to be of a mixed nature, and they did get up by turns. Somewhat a while after copulation they exclude or shoot forth little worms, as the Hen doth eggs; which afterwards by a strange Mesamorphosis are again changed into Flyes. Although Blimas and a strange Mesamorphosis are again changed into Flyes. though Pliny contrary to experience doth without ground affirm that nothing else doth affices. them. Very rightly Scaling faith, that the Rives at first do generate Insects unlike themselves, but yet in a capacity of becoming the fame, (that is to fay) white little worms, which afterwards

being made like to Flies, have eyes hanging down by their fides; in reference to whose likeness there is a kinde of disease in the eye, called punctions, i.e. headed like a Fly. Now a great number of Flyes, if not the more part of them, arife from dung, whence I have feen them to come perfect where before they were begun. But in this kinde of generation we must note, that fives are not immediately procreated of dung, but of the little worms proceeding of digested ding, as the Philosopher writes in these words. At A pulca in the or or or or in the in the continues of the in the continues of the interest migs, oc. Which Gaza translateth thus: Musca en vermiculu simi digesti un partes gienuntur. &cc. In English thus: Flyes are begotten of dung digested into parts, therefore they that desire to meddle in this businesse, strive to distinguish the dung that is not digested, from that is mingled with that which is digested. Now these worms at the first are exceeding small, afterwards begin to be red, then as net without motion as it were, cleaving by fibres they begin to move; then they become unmovable worms. afterwards they move againsthen become they again to be without motion, and in conclusion by the affiftance f air and sun there is begotten a living Fly. Arist. here, as it seems, spake rather from others obfervation than his own skill. For neither those worms that are generated by copulation: nor those which are bred of putrefaction are subject to so many metamorphoses or transmutations, before they are transformed into Flyes. For they only grow to such a bignesse, afterwards are tuned into a Nymph or young Fly, and so lie still, then at a certain time appointed by Nature the Nymph groweth to be a Fly.

Neither are Flies begotten of dung only, but of any other filthy matter putrefied by heat, in the summertime, and after the same way spoken of before, as Grapaldus and Lonicerus have very

But yet the question would be, whether Flyes are not immediately generated of putrefactions and not of those worms. For experience witnesseth that there are a certain kinde of Flies which are begotten in the back of the Elni, Turpentine-tree, Wormwood, and so perchance in other herbs and plants, without any preceding vermiculation, or being turned into little worms first. So that Scaliger that angelical man, and the most learned of this Age, writeth thus of their original : Peradventure (faith he) they may seem not to arise from putresaction, but from some certain principles changed as from some kind of liquid gum, or from some other matter concolled by Nature for this Now whether concoction can be without putrefaction there is the scruple. Each part of mans body hath its conveyance for the expurgation of its excrements, called in Latine Emunitor na. But whether a living creature may be the excrement of a creature that never had life, let others determine; here my fight fails me, or rather I am altogether blind. A third way how Flyes are begotten, Sir Tho. Knivess an English man, and of singular learning, did first of all inform Penniss of, and it was thus: The corrupted body of a Caterpillar or a little bruifed, is conmied into an imperfect Aurelia, then from that not a Butterfly, but three black eggs are cast ox that are somewhat long sashioned, from whence proceed ordinary Flyes, or others like to them; and some times the Aurelia being putrefied, neither Butterfly nor eggs come forth of it, bawhite worms, (sometimes one, sometimes many) come forth, whence are generated very imil Fives.

The which famous observations of natural History truth it self doth enjoyn us to acknowledge received from the foresaid Knight; for no man before him did ever observe the like. Peter Martrin his 3 Decad. and 6 Book, reports that he saw drops of sweat falling from the fingers of labouters, turned into Flyes, and so they write that in the marshy Countrey of Paria, by reason of the contagiousnesse and venemous quality of the air, the drops that fall from the hands of the labourers do bring forth Toads. But whether it be done immediately or mediately by some worm out of which the Fly should break forth, he doth not shew.

In the year 766, before the Nativity of Christ, Rivallm then being K. of Britains, there were showres of bloud three daies together very great, very many, from whence came abundance of Flyes, and so poysonous, that with their stings they killed a great number of people; so saith

the English History.

Now the Fly for the most part is not at the first a Fly, but a worm, proceeding either from the dead corples of men, or the carkaffes of other creatures, then it gets feet and wings, and so becomes of a creeping creature, a flying; and begets a little worm, which afterwards becomes a Fly. Take off the head of a Fly, yet the rest of his body will have life in it, yea it will run, kap, and seem as it were to breath. Yea when it is dead and drowned, with the warmth of the im and a few ashes cast upon it, it will live again, being as it were anew made, and a fresh life par into it, informuch that Lucians disciples were perswaded and did verily believe that the soul of them was indeed immortal. Forasmuch as it goes and comes, it owns its own body and raiforhit up, so that it. drinketh, eateth, wipes its head and eyes, makes clean its snout, rubs its shanks and legs, claps its wings and flies: verifying the opinion of Plate concerning the immortality of the foul, and the fable concerning Hermosimus Claramenius, whose soul would often go out of his body, wander up and down a great way by it felf, and afterwards would return into the body, toplenish and raise it up again. Some will put drowned Flyes into warm Ashes, or warm Bran, and in a quarter of an hour fostering them in their hands and breathing on them, they will bring them to life again. s all de era 1884 bills di balanca de la la Ny INSEE dia mampiasa di Balanca di Balanca

CHAP. XI.

Of the divers kindes of Flies.

There is a great deal of difference amongst Flies, whether you respect the matter or form of them. Some of them come from themselves by way of copulation as hath been said, others from some ascititious or external matter: such are they that are bred in Dung, Apples, Oaks, Beans, &c. In regard of their form or shape, some have two wings, others four, with horns or without; some short, some long, some have round tails, others sharp or piked, hairy and withwhout; some short, some long, some have round tails, others sharp or piked, hairy and withwholt; in a word, they vary in colour, shape, bighes according to the nature of the Countrey out hairs: in a word, they vary in colour, shape, bighes according to the nature of the Countrey of the putre in, or the putre and matter whereof they are made. I wish I had seen them all, and I know Apelles, himself would hardly have been able to paint their fashions.

know Apelles minient would have your forts of Flies. For either they are daynoodyn, or Now for brevities sake we will make two sorts of Flies. For either they are daynood, or how for brevities sake we will make two sorts of Flies. For either they are daynood, or how for the feed upon other things. The

interespont in the tract reed upon their own species, the wolf sty is first of these called in Latine, Lupus, in English, the wolf sty is described to be big, black, with long shanks; he seeds especially upon slies; if he cannot come by these he preys upon other Insects. Those that feed upon things of another species: either they are such as feed upon living creatures, or upon things inanimate or without life. Of the first kinde is the Fless-fly, Horse-fly, Oxe-fly, the Suck-egge-fly, the Fly that eats Serpents, the Dung-fly, the Fly that preys upon the Humble Bec.

The Flesh-fly, in regard of his bignesse and bulk of his body, is the biggest of all other, he hath a reddish head, his body full of gray spots, his belly thick, blew, transparent, having two wings, hairry, very greedy of slesh. He slies for the most part alone, unless it be perhaps in the stellar market or Shambles; where the Bucchers turn sencers, continually killing and beating them away with their Fly-slaps, lest with their fly-blowes (which Hippoerates cals was in Greek) their slesh should be tainted. There is a story (as Calius Rhodiginus relates it) that at Tolerum in the open Buccher-row, one Fly amongst the rest used to come by the

space of an year, as white as snow, which I dare say was of this fort in regard it was seen to be The Dog-fly, fo long together in that place. Kurouwia, Musca canum, in English a Dog-fly; in the German tongue Hunds Fliege, Hunds Mucken; in the Polonian, Psia Mucha; Isidore, and Euthymins and Philo, suppose it to be a Wood-fly : very irksome to the ears of Dogs, the which notwithstanding they shake it off never so often, yet returns with as much violence as before; where if he tarry any while, with the galling of the flesh he raiseth a blister: of whom Homer in his Iliad. 15. Tial au moopula sies seed Eurenaureus, i.e. why like a Dog-fly dost thou contend with the gods? Athenaus also in his 4 Book, reports that the like name of Dog-fly was given to a cortain famous Curtizan for her unparallel'd impudence, mordacity and troublesomenesse, Now the Dog-fly (to borrow the words of Philo) is an Infect that bites hard, is importunate and treacher rous: Voquer Nies Inches, draudes & draudes. This feemeth to me in holy Writ, as in End 8. Pfal. 77. & 104. to be the common name of all hurtful Insects, as appeareth by the Chaldee Paraphrase. As for their more special signification, they can be compared to no kinde of Fly better than those black great broad flat ordinary Flies which do so boldly fly upon catteland not only fuck from the outermost skin of them warry bloud as other Flies, but with great pain feeth out and finck bloud very deep. They want a front, but in flead thereof they have two teeth as the Wasps have, which they fasten deeply into the skin, but more especially they insert and annoy the ears of Hounds in Germany, informuch that (as Camerarius witnesseth) they even place of the selin. These are Englished Control of the selin. off the skin. These an English Gent. said he saw in Italy in shape altogether like the bog fly, only without wings: whose wings also are represented to close to his body that the learned Dr. Barbar takes them for the same. Niphus doth ascribe unto it wonderful swiftness of a roundnesses them for the same. Aspens doth ascribe unto it wonderful swiftness of ingle of a roundnesses of body. The nearest in likenesse to it is the Tick or Sheep-fly, making a kinde of a horsid noise as he flies, and is in his flight more flow and heavy them a Gad-fly. There are two kindes of them, differing only in bignesse, the greater which is the Forrest-fly, the other the less living in bedges and switches.

living in hedges and quickfets.

The Horse-sty called in Greek lames (not), in the German Tongue Ross Mucken, is of the bignesse of the ordinary Fly, with a slat, hard, smooth body, and of so compact a substance, that you can scarse break it betwint your singers; they are somewhat blacker than the common sort of Flies are, they never sly right forward but sidelong, as it were hopping the common sort of Flies are, they never sly right forward but sidelong, as it were hopping and skipping as they go, they sly neither long nor fast. In England especially shows very troublesome to Horses, stinging them continually about the ears, nostrals, and

the tails, with the sweat whereof flowing down to the root of the last they live and are sustained. The English call it a side-fly or a Horse-fly, as the Greeks and combines, of the like signification. Some of the Greeks call them wrocessus, and they say that in hot Countreys the Dogs are very much vext with them. They say that it is of that kinde Groto makes mention, having wings and able to fly; but yet I think this to be another species; and only proper to Horses, and offensive to them.

This Beatt-fly is in Latine called Afilum; in Greek offers from stri-Brees of king or stinging: whence not only this Insect but another that useth to Beast-fly, scare Bees (of which hereafter) and a third very so midable to some kinde of Fish, are called by the same name of Oestrum. Of this kinde of Fly the

Poet Virgit in the 3 of his Georgicks chanteth after his manner :

A Fly there's in Silarus woods, that much Useth neer to green holm, the Greeks call such Oiltron, Asilus is the Latine name, It makes a sharp harsh noise, and with the same Heards of cattel frighted sty and guiver, Woods, and barks sound of Tanaguis River.

Calepine and other Lexicographers of his gang, belides some Physicians, and even Plint himself Difference of makes this Fly one and the same with the Oxe-fly, so that it is very probable that they did not Asilur and Taso heedfully read Aristotle as they might, or did not indeed understand his meaning. It is confest banus. on all hands, that Afilus and Tabanus are a species of Flies, and that both of them have a sling in their mouth, with which they pierce the sides of the beasts, and suck out their bloud. For so saith the Philosopher, is winner if is of soon and Aguala And purion in relegation: Oxe-slies and Brees make holes in the skins of four footed Beafts, and they have a strong tongue which serve them for a fling, they are creatures that eat bloud, &c. But yet that they differ much, Arifforle and Ælian plainly shew. First the Tabani are more frequent especially in woods and highwaies that are beset with trees and hedges, as they who use to travel on horseback know to their great trouble and vexation. For in the heat of the day they sting deeply: And being then greater in number do draw out such a quantity of bloud, that many times the horses strength fails them, insomuch that the Countrey people are forced to beat them off from their horses with fly-flaps and foughs which they carry in their hands. But the Afili are more rare, and never fly but near the wiferside. Moreover the Asili (as witnesseth Aristot.) do take their beginning of certain kinde of broad and flat little creatures which haunt about rivers sides: but the Tabani come of certain moms breeding in wood or timber; that which Softrates wrote, and Pierius diligently hath obferred. Besides the Asii do trouble Oxen and all living creatures, according to that of Hespehin, what unia ris isolican rate site is man Coor shadren, signet A ubror ser, but the Tabani trouble Oxen only. To which agreeth that of Orphens, verf. 47.

> Nov a' two deedoolly dwinfers Mig of pos, Huntegor Muas camegalitair els seguin evelup, esc. The horrid Brees mans body dosh not spare, He flies from us into the open air.

And Homer in his Odyffes.

Oid' iposorro x' uspages, sois is dystaiau Tas us's' atoros ipopundels issents Den ir siaceni, ore T' huala uanea witor I.

But they fled home as herds of Oxen doe, When that the Brees doth force them for to goe, In the spring time when daies do longer grow.

Where the Scholiast thus defines this kinde of Fly, Oireis is Zãor variganar no papeir, &c.

The Fly called Oestrum is of a yellowish colour, who when it enters the ears of the Oise, causeth him to run mad: upon which Callimachus in imitation of the Countrey people cals him souver, an Oire-driver.

But the Myoper or Tabani do set upon Men, Horses, yea and Seipents (as Nicander affirms). Their shape and form is also different, as the Philosopher sheweth Depart. Anim. 1. 2. in these words: The tongues of the Asili and Tabani are alike, of a purple colour; yet these dare seize upon men, the other upon Oxen only. Now the Asilis hath agreen head, and the rest of his body all over yellowish, having a greater snout than the Tabanus, but making not so great a noise, or buzzing; he carries before him a very hard, slifte, and well completed sling, with which he strikes through the Oxen his hide; he is in sashion like a greaterly, and forces the beasts for sear of him only to stand up to the belly in water, or else to betake themselves to wood sides, cool shades, and places that the wind blowes through. For whilest they stand in the cold water they stap their wettails all about their bodies, and so cause him to be

gone. The Scholiast of Nicander faith that they are bred of Hotteleeches. As if he would have gone. The Schottaff of Ascander that the flat creatures (of which Arift. makes mention before) and us to underthand Horseleeches by those flat creatures (of which Arift. makes mention before) and us to undertund moneteeches by those that bloud-fucking mothers, should bring forth a bloud-yet it is against nature or experience that bloud-fucking mothers, should bring forth a bloudfucking brood. He flies exceeding fwiftly; drawes bloud with much pain.

Remites hathfer down 2 very rate kindes of Afili, one of which was fent him out of Virginia Pennius nath let down 2 very rate kinds of Chirurgeon for a gear prefent. That out of white, the other out of Ruffa by Elmer a Chirurgeon for a gear prefent. That out of by White, the other out or Rujjia by Eimer a standard and very like in shape too, but Virginia was full as big as the biggest Flies, having a reddish head, and very like in shape too, but only that the head was black, and had from the shoulders a white stream to the mouth, having and read the standard and the standard to the standard and the standard as the standard and the sta only that the nead was blacker eyes. He had in his mouth a long sting and very strong, his shoulving allo bigger and dia ket eyes the same forth two wings of a filver colour, to the tail there of a blackish brown colour, from whence came forth two wings of a filver colour, to the tail der of a blackish brown colour, from whether can be a whitish colour, all the rest of the body downward, it had fix or seven joynes or fisheres, of a whitish colour, all the rest of the body blackish. In swiftnesse of flight inferiour to note; surpassing the most, his belly was between in blackish. In twittnesse of higher therefore that of Elmer which came from Moscovia, had liver ash and yellow colour, or a pale green. That of Elmer which came from Moscovia, had liver ash and yellow colour, or a pare great eyes, very long, taking up almost all the head, a black bill wings longer than the whole body, great eyes, very long, taking up almost all the head, a black bill wings longer than the whole body, seem of hand the penetrates hole lined with a three double or beak, hardiffs, tripartite, with which out of hand the penetrates hole lined with a three double or beak, narmin, tripatities, with it with great pain. As for the Generation of the Afili, or the cloth, skin, flesh and all, sucking it with great pain. cloth, skin, nein and any mening at the inconstancy of the Philosophers opinion thereupon. For Fly with great eyes: I wonder at the flat creature fwimming in the water (which the Scholiaff first he makes them to come of a little flat creature swimming in the water (which the Scholiaff of Nicander not unfitly cals Borna, i. e. Hirudines, in English Horfeleeches) and in the 8. of his of Nicander not unntry cars pourses, s. e. Liernames, in Light woods: will find the 8, of his Hillo yo he will have them the off-spring of the Gnats, in these woods: will have them the off-spring of the Gnats, in these woods: will have them the off-spring of the Gnats, in the words in the w er ne upen, was or expenses of the first in moysture, and after that they change their shape and live out of it, as it fals out with Gnats about rivers, from which proceeds the Brees. But how that can be I know not: For or creatures that have wings, it is impossible that other winged that can be a know not: 101 of closed as the diligent observer of Nature may easily gather. And so much of the Oxe-fly which the Gaths call Hestabryvis: but the English have no name for it. [Wherein the Author feems to me to be mutaken, because it hath afforded it a very proper name as is abovefaid].

The other Tabanus or Assum is begotten in the utmost part of the combs, and exceeds in bignesse any Bee whatsoever, which, because he is so troublesome, not suffering the Bees to be at quiet (as the former would not suffer the cattel) the Greeks have comprehended under the same

name of Oestrus. The head of this Fly is of a bright bay colour, with a white streaming from his forehead to the nape of his neck, his shoulders and back of a duskish colour, in all parts else no way differing from the common fort of Flies.

He feeds not only on the juice of flowers and honey, but on the bloud of

bealts, which with great tedioninesse and pain he sucks out.

There is another Fly much of the same fort, with a head and body more in-Clining to green. His shoulders shine with greennesse, wings he hath two, whitish in the middle and outward parts, but are otherwise blackish or dunnish. This only once Pennius saw it it Hanworth in the year 86. in the moneth of August. In the year 82, he found in England two other forts of Flies like Gnats; one of which had a perty big body of yellow and red colour; it had two wings, the head very long, the tail reddiff. The other also had a long head, long and flender shanks of a very fad black colour : the latter were longer than the former which he stretched at length when he flew and let hang

A Countrey-manthere was that affirmed for certain, that out of their eggs (for he had oblew ved them coupling together) came those worms that usually eat the leaves of trees.

The Fly called in Latine Tabanus, is of the Greeks called work, by reason perchance of its flinging or pricking, for much fignifies also a spur wherewith horses are pricked or spurred. The French call it Tahon; the Italians, Tahano; the Spaniard, Tavano; the Germans, Braum, Kaflyege, ross muck; the Brabanters, Rochleghebrem; the Polonian, Kiromia muka; the English, Burrel-fly, Stowt, and Breefe: and also of ticking and clinging, Cleg and Clinger. This Calepine more boldly then truly faith hath four wings. But with more judgement Elian and others, fay it hath but two filver white. The whole bulk or body is very long, divided into three principal arms the hard for the state of cipal parts, the head, shoulders, and the venericle or belly, dislinguished with five or six cleres or incidures, the whole body of a blackish white, in the mouth of it it carries a strong long, and browny Proboscis; it hath six black feet, in all parts else representing much the Dog dy. In the moneths of July and Angust, by reason of the extremity of heat they are most fierce, and do mis enably handle Oxen and Horses and young cattel, unlesse protected with fly-flaps, boughs of trees, or plants: which they follow by fent of their sweat, because they cannot reach them with their substitutions their substitutions and the substitutions of their substitutions and the substitutions of their substitutions and the substitutions of the substitutions of their substitutions of their substitutions of the su their fight, being very weak fighted, from whence the infirmity of the eyes called publindnesses in Creek samed and the control of the in Greek termed wwarder. They are generated faith Pliny of the worms that come out of the word pure field. Which is a short the in so great abundance, that a friend of mine whom I dare believe told me, that his horse being

tyed to a tree, was by reason of the multitude of them, killed in lesse then six hours, they had drawn out so much bloud that the spirits failing he fell down dead. By these things it is manifest. that the Tabani are of a different nature from the Afili, notwithstanding that most of the Greek and Latine Authors do feem to confound them and make them all one. Yea even Gesner himself in this yery matter could not tell what to say in his book de Quadrup, and indeed unlesse it were only Pierius and my friend Pennius now deceased, no man as yet found the difference between them. Ardoinus is here desired to be consured in the first place, because he high that both the Tabanus and Afilus have stings in their tails as the Wasps have; and secondly, because he makes them to have eight feet, whereas none of them in the world was ever known to have above fix. Lastly, he reckons them in the classis or rank of Gnats, whereas the Gnat never bites in the heat of the day (as the Afilm and Tabanus do) but altogether in the night at what time they are very irkiome indeed.

CHAP. 11.

Next to these is another Fly shrewdly annoying cattel in the heat of the day, which Pennius cals Curvicandam, very well in English a Wringle-tail, in regard that alwaies sitting upon the buttocks or belly of the heaft, he bends his tail towards him with his fling started, that he may be ready to strike at pleasure, whensoever opportunity may offer it self. This Fly the English in their proper tongue call a Whame and a Burrell-fty, and it is scarce found any where else but in England. This kinde of Fly is almost like the Bee in shape and colour, only it is bigger in body. It doth not cleave to the flesh, nor suck bloud as others do, but only stings with its tail, flying a long way after horses, and stinging them in their travel. Horses are naturally asraid of this Fly, whom upon the least touch they endevour by what means possible with their tails, teet and mouths to drive away. Some are of a minde that these flies do not indeed use a sting, or prick, but with their tails they fasten their dung to the horses hair, from whence a while afte: come a number of very irksome Nits. But experience must prove that, for reason in a matter so improbable is filent. True it is they are very violent upon their prey, as being blinde both the Tabania and the Wringle-tail, which may be the reason why they are so bold and fearlesse, as being fecure of any danger. But especially the Ochrus, from whence those famous Poets of old we e faid to be Oeftro perciti, flung with this furious Fly called Oeftrum. Plutarch cals them inspinatopieve, Gad-Stricken.

Those kinds of Flies that follow are more rare.

The first of which is very like the lesser Butterfly, with four filver wings full of blackish spors, all the body over adomed with silver streaks running athwart of it, the tail reddish or brownish, the head black, the shoulders of the same colour with the tail, the fore-yards are thin, black and short, the feet small and black: they are most commonly feen in hedges, especially in the morning. The second very little differing from the former, but that the body, sail-yards, legs and feet are of a brownish or duskish colour. The third species hath four wings: this hath longer wings than the two former, spotted with black spots, the head somewhat bigger, black, here and there marked with yellow spots; the two fail-yards thin and black, fix whitish feet fastned to the more bulky brest, the shoulders are embroidered with yellowish white spots, overthwart the back are five streaks of a yellow colour, with a little spot or speck between each almost of the same colour; in the tail there are five red spondils, the end of which is forked. The fourth is not much unlike, but it hath filver wings, without spots, the fail-yards black and somewhat longer, the body is adorned with feven white lines athwart. I have feen also two Flies with tails like Scorpions. The first of them, as the former spoken of, hath filver wings, but somewhat lesse, with three crosse black listes towards the end, the head black, the breaft, the feet and shoulders whitish: the rest of the body black, the tail hath five joynts as it were or partitions, three of which are of a pale red, the rest black, the end of the tail forked, the forks are black, and like the Scorbion turned up. The other almost like to it, but the very end of the tail is

more thick, the fork that is in it more blunt, the head dunnish, the mouth somewhat long, each wing bedeckt with fix black spots. There is also another fort of Fly that hath four wings, the body greenish, the four wings longer than the body, made as it were of melted filver, the nerves whereof are greenish, the sail-yards thin and black, eyes as yellow as gold, from whence it hath the name, and that not undeferredly of Chrysopis a golden eye, flow in flight, of a very

The fecond kinde of Taba-

Gnat like.

strong sent, which like the Moth it loseth with the life. A great frequenter of gardens and sitting firing fent, which like the moth it follows the Butterfly doth, or out of the worms of trees, on Elder: whether he come of a Caterpillar, as the Butterfly doth, or out of the worms of trees, on Elder: whether he come of a Calcipring of trees, I cannot tell. That most learned and courteous Gentleman Joach. Camerarius suff shewed it to

mnins.
There are fundry forts of Flies, of the Greeks called religion, in Latine, Pilicanda, Sericanda; in There are fundry torts of Files, or the State of them have one, others two, others one yet three English Hair-tails, or Briftle-tails. For some of them have one, others two, others one yet three

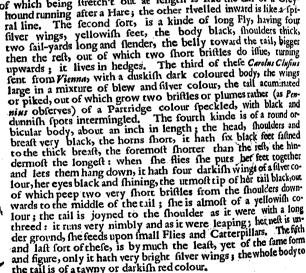

or four briffles in their tail : of which in order, or four brittles in their rail: or winch in older.

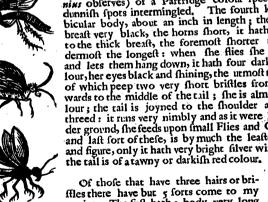

The first of these called Henethrize or Unifeta, is a fly that hathatail, the whole body is black except the middle or the back and belly that are red; it hath two silver wings, the shoulders except the middle or the back and belly that are brittle short forth of the rail to the shoulders. except the middle or the back fail-yards, and a long briftle short forth of the tail of it. The figure of thick, with two little black fail-yards, and a long briftle short forth of the tail of it. The figure of

this Fly did the abovefaid Jeachim fend to Pennins, withall attesting that it never offered to light upon any other herb but the chiefest Amess. Afforeiges, are two Flies that have two hairs in the tails of them; whereof some have bodies sharp or piked at the end, others more blunt. Of the former fort, two I have feen with four filver wings without spots, head and shoulders blackish, the rest of the body dunnish, bedecked with divers crofle lines of black. Both these had long and slender fail-yards, and the like in the tail, only somewhat longer, the body big and bulky. Those of two hairs or bristles are of five forts: the

first, in all things like those with a hair, but that these are almost all over yellowish, it hath two very long briftles in the tail, one of which being stretch't out at length is like the tail of a Grey-

notice. The first hath a body very long and black, the middle very red from black, with two black horns in the head, fil-

ver coloured wings, the very edge or extremity whereof is spotted with a blackish spot, the thighs or shanks reddish, in the tail it hath three long hairs or briffles, and flies very swiftly. The next is like to this, but lesse, all over black, longer than the former, thinner and slenderer, it hath filver wings also, the cornicles or horns all one with the former, it also thrusteth forth three long bristles at the tail, not so swift in slight by much as the former. There is another of this kinde all over whitish, but only the wings, which are spotted with four black spots; the utmost of which are larger, the others shorter, which

CHAP. II.

to long as she flies not, stand bolt upright: she hath six seet, the four lesser of them sattened to her body, the two formall are greater and black, coming as it were out of the neck, between the swallfack round eyes which standeth forth of the head come forth two black short, horns; the body thin, round, long, about a singers breadth; in the sail all to be sain three britles as long as the body, the which when she slies she pure into the form of an exact triangle. In the moneths of May and June before and after rain the is to be feen; the flies ordinarily about rivers with fome company

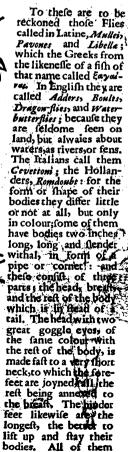

with her, with whom the feems to from her felf by the way, the useth her forefeet fometimes to feel whether affecting lie in her way, extending or first ching them forth in manner of little horns. Such work as this Pennius took notice of in the year 13. The fourth of these is of an admirable structure, it has no give rwings,

the body black, the mouth forked and Eagle-bill'd, in the forehead sprout out two little short horns, it hath only four feet, two winder the breast small and short, the other two a little below firm and strong; out of its tail which is very long iffue two very short briftles, and between these, one of a great length and blunt at the end. This kinde of Ely Rennine remembers that he faw only once about Hinning ham, sometime a fort belonging

bers that he law only once about Hinningham, sometime a fort belonging to the Earls of Oxford. The last of all both body and tail is all black, it hath a very long body, two wings somewhat shorter then the body, the feet of a reddish yellow, the tail altogether as long as the body, seen only once of Pennsu about Greenhive in Kent.

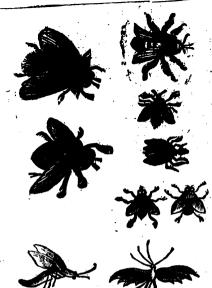

The Fly with four hairs represents the first of those with three hairs, only its tail is somewhat bigger arthe latter end of it, the feet as also the horns black, the wings long, the outermost three times exceeding the innermost in bignesse, having a black spot in the middle, and in the tail

Lill 2

940

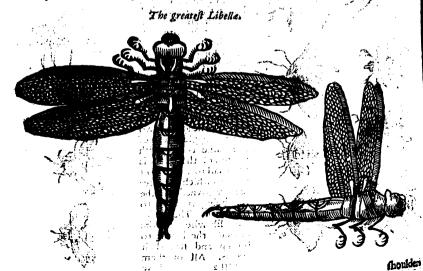

have forked tails, and With these they couple, remaining long in the act of generation Countreymen for the most part of them, are of opinion that these Flies are ingendred out of the wornis that grow from the water-bulrush putrefied; which if I should yeeld to be true, yet doth it not take away copulation, and putting forth of worms from their own bodies, whereby they might from time to time increase, and perpetuate their propagation.

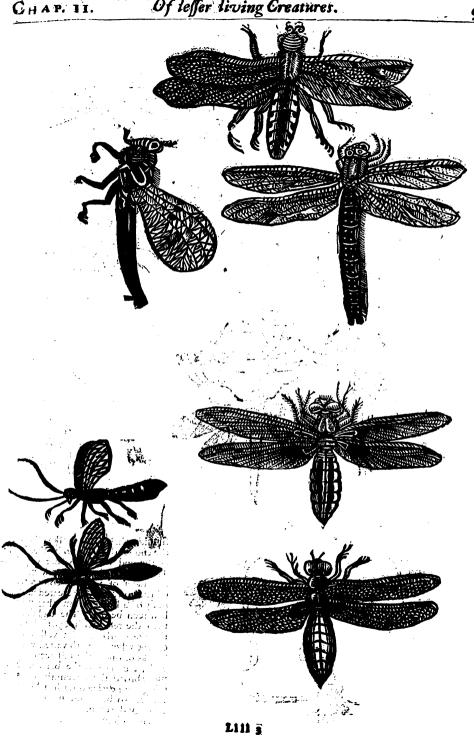

The lefter of them

are very flow of flight, the greater very fwift, and are only to be feen in heat of Summer. Of these we have observed three forts or species: The greater, lef-fer, and least of all. The

biggeft of all, some of
the English call Brifes. Of which fort eight only have come to our view. The first greenish, the
spots also in the neck and tops of the sides of a dark green, the wings silver coloured, they are iwift and make great speed in their motion. He hath seven black lines athwar the back, and feeds upon flies like the Swallow. The second is like to this, but of a more dark here. The feeds upon flies like the Swallow. The fecond is like to this, but of a more dark hew. The third hath eyes like to pearls, filver wings, the hem or extremity whereof is stained with a dusky spot, the body is black, but very seldome yellowish on the back and belly; the tail black and sorked, adorned as it were with two plumes. The south is of a muddy colour, having the seld-divided as it were into six parts; neat about the coming forth of the wing which are like silver, you may perceive a large black spot, distinguished in the middle with lines of mud colour, toward the end of the tail there appear som or sive hairs or bristles. The sitth hath its head and tail gray, the mouth black, the silver wings marked with one spot, in the end of the tail it haththeebrisles in manner of a Trident. The sixth is silver winged, with a black spot in the middle, the body all over black; the back and belly sometimes, but that seldome of muddish colours he breast and

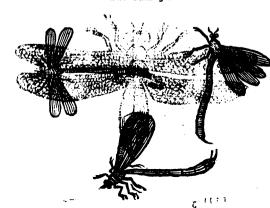

CHAP. 11.

The Mean.

The Smallest.

fhoulders half block, halk yellow, under the end of the half block on booked briftler, at the end of the half block of the half block, and fhoulders of the half block, and fhoulders of the half block, and fhoulders of the half block, and fludy of a like workered in Pomine fludy of a like with eyes like pearls, the body all over of a yellow colour, except where it is thwatted with cross fireaks or lines, the tail feems as if the end were cut off, the but end thereof more broad, the extremities of its five wings are darkned with a black foot, they are to be found most commonly amongs the corn.

The middle fort of the Libella do

ferforth Natures elegancy beyond the expression of Art. The first is of a most curious colour. The body blue or sky colour, the wings of bright violet colour, the space between the shoulders is adorned with four golden gents, set as it were in a blackish collet. The second hath the head and body gray, the wings whitish, which are beautified with gray lines drawn quite through them, in the middlethey are of a purple colour. The third hath its head and body of a greenish colour, the lines of the wings aremarked as it were with bloud colour streaks, towards the edges or our-most parts like to a dark purple. The fourth-seems to be all over of the same colour, to wit, of a duskish colour mixe with a pale green. The eyes of the fifth are blue, the head green, the whole body mixt of green and body except the wings, which are most accurately wrought with silver colour and black, in the trade and owned with a dark purple. The sixth is all over green; yet and the wings themselves are at the recent.

ilver colour and Diack, in the impression adoved with a dark purple. In earth is all over green; yet and the wings themselves are at the green.

Therefeen four of the least contribution of the least of the green.

The first the body all over of a bright blue colour. The shird yellowish, but the tail more thick; the edges of the wings (as also all the lines that run along them are red and marked with a bloud colour ipor. The fourth which is the least of all, hath a long spiny tail, a great head, blue eyes standing out with two little horns to guard them; the body somewhat long, itender, underneath greenish, above blackells, on the back it hath two greenish lines or streaks drawn along from the head to the rather of the avings, the tail bound together with five joynts or knots, in the end whereof is a range of blackell.

One there is of this number which talketh tome of the other bigger very speedily: of a thin gray coloured body, and the wings albe coloured, and when he creeps into an apple, no hole can be seen where he went in: he feeds also upon seeds. This Fly william Brewer a learned man and an excellent naturalist sent to Pennius. There are found in the leaves of young Fennel Fies of an exceeding smallnesse, inastruct as sometimes they are for little, that they are not able to be seen; they run and say very swiftly, insomuch that you would wonder how it were possible for mature to rate seen and wings to such very exceeding small bodies.

exceeding smallestie, inassimuch as sometimes they; are so little, that they are not able to be seen; they run and sly very swiftly, insomich that you would wonder how it were possible for nature to ratten seed upon the seed of the Greeks balled inso, or Licustres, as abiding in sonny places, are those that seed upon things that swim upon the surface of the water, and that tive especially upon the water, as these and the like, Phryganides, March 12 garina, Eschan Luttus Fusco & Phryganides (which in English is called Cados worm) siving in the waters, and in the mids of August according to the top or superficies of the waters; it bath four wings of a brown colour, the body somewhat long, having two short horas, the suffersked, or rather bristles coming out of the tail. The form or sigure of this Fly is various, in regard of the geat variety of those little Cados worms whereof they come.

Among the Macedonians about the River Austraum which runs in the midst between Beroza and Thessalonica, there say a kinde of Flies, which are not every where to be sound, neither are they any way like other Flies, they are neither like the Bees, Wasps or Horners, yet resemble allin fomething, in bignefle the Horner, in colour the Wafp, in humming the Bee; in audacity and boldnesse all the rest of the Flies; the country people call them in regus, the Latines Equise-lus; these slying upon the surface of the waters become a prey to the fish that are in the river. The greater summer Water-fly is seen in Helvetia in the moneth of May (commonly cald Tes glaffi) as we have heard reported by a Gentleman, but which we leave to those of that Countrey to describe. The Æschna so called, are a kinde of Water-fly of an ash colour, with four wings, six feet, near the tail having as it were many downy hairs. The Witter dy called Laten is of a vellowish dun colour, it hath long wings, alwaies standing bolt upright upon the shoulders so long as it flies, the eyes big and flanding out of the head, the tail long and knotty, having two long hairs or briffles at the end of it; the is converfant alwaies about rivers, feldome elsewhere, especially after rain. There is another of adun colour with four long wings, and long shanks, the body full of joynes, two long horns it carries in the forehead, the headthatle, the eyes blackiff and fland ding out of the head, the wings dun, but a little more bright then the rest of the body. For the most part found in woods adjoyning to fens and franding waters. To conclude, I shall relate amongs the rarer fort of Flies, that of Cardane, as he himself describes it. Thus: I have saith he a little creature like to a Beetle, of no unfavoury smell, sofe, and the swiftest of all that ere I knew of Infects, it is of a dark yellow, not black, with fix feet, and two wery thore thin wings not covering the tail; the tail is of the same figure and form with the head, insomuch that you would think it had two heads; for as it hath a mouth in the upper part of the head, and two small comicles there under the chin, so it hath two onhers also in the lower part longer then the creature it felf, as many likewise in the tail, but these shorter then the two longest in the head; only the uppermost of those are longer and thicker then the lowermost. Which rare creature I with I had seen with Cardinalo than I might have hete added no this description the figure of it. There is also bolides the 18:2 Water Ay, which men call from and length of the feet or shalles of it, Tipatrima Alasvandium, Redamin Grainna; called thecefore in English's Cram Fly. Of their Elies, and found four forsa. The full species hath song shanks like a wood spidery the body almost avail of a whitish ash stolons saver wings, blackeyes shicking out, with two tery thore hornes, the call pointed or piked. It dies (much tike the Olerich) thopping with besiece, comercines it dies inithesirchatmor far mor dong. So greatly after the lighty that it

944

oftentimes is burnt in the candle. In Autumn it is frequently feen in pastures and meadowes. This of the male kinde. The female is almost alike, but somewhat more black, the end of the tail as it were bitten off; these are called in English Shepherds, in Latine Opiliones, because they are most often seen where sheep use to feed. The second fort of Tipula hath a great head, eyes standing out, four small horns, the body pleasantly various with the colours yellow and black interchangeably mixt. The third is almost like unto this, saying that the body being all yellow, is better fet out with fix or feven black spots; both the male and female have a three forked tail. The fourth species is very rare and curious, the head and especially the mouth forked, the shoulders swelling, the feet shorter, the body twice as thick as the rest; the back black, the belly and fides vellow, the tail black and picked. It lives in hedges in the Summer, and is seldome found in open fields. Those Tipula or Crane-flies aforesaid do couple with their tails turned to gether, and so they fly; yet fometimes they turn again as it were to embrace one another.

CHAP. XII.

Of the use of Flyes.

Hese little creatures so hateful to all men, are not yet to be contemned as being created of Almighty God for diverse and sundry uses. First of all, by these we are forewarded of the near approaches of foul weather and storms; secondly, they yeeld medicines for us when we are fick, and are food for divers other creatures, as well Birds as Fishes. They shew and set forth the Omnipotency of God, and execute his justice; they improve the diligence, and providential wisdome of men. All which shall appear in their places.

Prefaging of

As for their presaging of weather: when the Flies bire harder then ordinary, making at the face and eyes of men, they foretell rain or wet weather: from whence Politian hath it.

> -----Sitienfq; cruoris Musca redit, summosq; proboscide mordicat artus. English:

Thirfly for bloud the Fly returns, And with his sting the skin he burns.

Perhaps before rain they are most hungry, and therefore to asswage their hunger, do more diligently seek after their sood. This also is to be observed, that a little before a showre of a from comes, the Flies descend from the upper region of the air; to the lowest, and do fly as it were on the very furface of the earth. Moreover if you see them very busic about sweet meats, or unguents, you may know that is will prefently be a showre. But if they be in all places many and numerous and shall so continue long (if Alexander Beneditiv and Johannes Damascentis (ay true) they forestel a plague or pedilence; because so many of them could not be bred of a little putter faction of the air.

Many waies doth nature also by Flies play with the fancies of men in dreams, if we may credit Apomasaris in his Apotelesms. For the Indians, Persians, and Agyptians do teach, that it Flies appear to us in our fleep, it doth fignifie an Herauld at Arms, or an approaching difease. If a General of an Army or a chief Commander dream that at such or such a place he should see a great company of Flies; in that very place, where ever it shall be, there he shall be in anguish and grief for his Souldiers that are flain, his Army routed, and the victory loft. If a mean or ordinary man dream the like, he shall fall into a violent Feaver, likely may cost him his life. If a man dream inhis fleep that Flies went into his mouth or nostrils he is to expect with great forrow and grief im-

minent destruction from his enemies.

Nor do they only foretell fforms, that shall fall out such daies, or such times of the year; but Their uses they do afford much matter for Medicine, and cure for diseases. For Galen Out of Saranus, Acle-Medicine, piadet, Cleopatra, and others, hath taken many Medicines against the disease called Alopecia of the Foxes evill; and he nieth them either by themselves or mingled with them things. For so it is written in Cleopatra's Book de Ornatus. Take five grains of the heads of Flies, beat and rub them on the head affected with this disease, and it will certainly cute it. Ascepiades used to take a great many Flies heads fresh pluckt from the body, and rub the part that was bare or bald with this disease, especially if they were exulcerated. For the bloud of Flies (saith he) doth much help the parts that are exulcerated with Nitrous medicines, or are otherwise galled or fretted. Soranus used to mix a porfull of whole Flies dried to powder, with Alcyonium, quick Brimstone, Ginpowder, fowes Gall, and other like things against the Fox-evil. Some adde to these Bears hair, roots of Reed, and Fern, and bark of Chesnut; and with which medicine they cure perfectly not only the Fox-evill, but whatever defluxion of hair, and the thinnelle thereof however contracted; the place affected being only first rubbed till it be red again, with fig-leaves. Others in the bloud that runs out of the heads of Flies: othersome apply the asses of them ten daies together with the ashes of paper or nuts, so that the third part be the ashes of Flies. Some others do temper ashes of Flies with womens milk, or coleworts; some only with honey. Plint.

After the same manner, Haly and Marcellus burn the heads of Flies and mingle them with honey in flead of an oyntment. Braffavolus lib. de morbo Gallico, maketh use of both the bloud and the ashes of Flies against the Foxes Evill. The like Medicine Pliny userh to procure hair on the eye-lids: Take of ashes of Flies and Mouse-dung of each alike mingled half a penny weight, add to it two fixth parts of Sribium, and with these and Ocsipus or sheeps fat anoint the part. Some pelcribe Flies with the roots of Docks for the Leprone to be announted withall. Pliny faith that there were some, that for the same cause did give 21 red Flies dead, in drink, but those that were very weak a fewer number. That Flies are very good for fundry diseases of the eyes, not only Haly, Galen, Pliny, and Archigenes have affirmed, but also Neotericks or later writers, especially for the Pin and web, Bleer-eye, Iquint-eye, and warts on the eye-lids. If the eyes be washed in the evening with water of ordinary Flies diffilled in way of bath, for a moneths space, it will cure them of all spots or films. If the hair be often wet with it, it will grow exceedingly. But the Vestel mult be buried in Autumn, and the Material diffilled about Winter. With two drops of this was ter put into the ears, Gefner writes, the deafnesse of them will be cured; and this Medicine he hith he learned of a Jew. Mutianus which was thrice Conful, from observation, did hang a live Fly in a little linnen bag about his neck, wherewith the rhume or bloudflot of them was cured, as Pliny affirmeth.

Flies in an odde number being rubbed together are reported to be very good to cure a fellon on the ring finger. Bean Flies drank with vinegar do drive forth a horseech sticking in the throat. Haly Abbas. The Fly Napellaris, of the herb Napellus or Wolfebane fo called, doth not only cure the poyfon of that herb, but all other poyfon whatfoever, as Avicen witnesseth, and Julius Scaiger confesseth: from whence this Antidore is made. Take round Birth-wort, Mithridate of each two ounces, terra sigillata half an ounce, Flies of Napellus in number 18, juice of Citrons what may suffice, mingle them, make an Opiate. For (saith Scaliger) against the biting of the Tarantula, or any other venomous bealt, or the poyfon of Wolfebane there is no Antidote comparable to this. The same do Gainerius, and Petrus Apponensis teach us. Yea, moreover when as there is no Fly almost but will cause vomiting (as I shall make good out of Arnoldus) why may not all of them be thought preferratives against poyfon? Cardanus in like manner commends the Wormed Fly. But it is best learning of medicines by hands and eyes : William & rais pool of Supan holemakia. i.e. by known experience, left while we affect unknown medicines we lose the use of those we know. Hetels us that an oyl made of wood Flies was in great estimation; yet he telleth not us how to make or touse it. A Fly chewed and swallowed doth vehemently provoke vomiting. Arnoldar. I have heard of a certain man (faith Gesner) that was wone to take three or four Flies into his body, which gave him a very good flool. Take five grains of Broomflowers, let them be put into an batthen por, with butter here and there laid between them bed upon bed, with which the vessel may be filled, and being very well closed, let it be buried in horse dung, where the Sun useth to come, for the space of one year; at the years end you shall finde the Flies turned into an Unguent; the which afterwards are exceeding good for any grief whatloever in any part of the body, as I have learned of a friend of very good credit. Nones advise the take the bodies of great Flies when the heads are off, and rub'd between the fingers, and to are mint a small impostumate swelling therewith, for a special remedy. Fortist the Poet affirms,

that

CHAP. 12.

that there was a German maid which lived three years with eating of Flies. If cattel cannot urine, or that there was a German man without a live Fly into them, and it will give them ease. Columella, the urine scald their genitals, put but a live Fly into them, and it will give them ease. Columella, Neither do they forve for the health of men and catted; but withall do feem to be created for

Neither do they ierve for the heatest of their are fome kindes of Spiders which food and untenance or undry 10115 of cleanance on Flies, and almost on them alone, as if they hunt after Flies and prey upon them. Swallows feed on Flies, and almost on them alone, as if they hunt after thes and prey upon them. Swallow, inafmuch as without them the Swallow could not were to be supposed to be made only for them, inasmuch as without them the Swallow could not were to be supposed to be made only to them, but after them aloft in the air, in miny below live: and that the reason why in fair weather they hunt after them aloft in the air, in miny below near to the earth. Pliny affirms that the Bird called Himantopus, makes them his chiefest food. near to the earth. Puny annual state the Tigurini, Muggent (as if you would fay, the Duck that There is a kinde of Dick cancer to the Duck in bignesse, which greedily snatches up the Flies swimming

on the water and eats them.

The Chameleon which some have reported, but fally, to feed only on the air, feeds on Flies, which with his tongues in inches long, putting it forth suddenly and waving it to and fro, he hits which with his tonguesta findings form, as I have seen with mine own eyes in the year 1571. All those Birds called Wagsails (if I am not deceived) live upon Flies, but especially those that are whitish about the tails: in the German Tongue todten 'nogel, but others call it more properly Muggen flicher; in Greek, uniteasy; in Latine, Mufcivorum; in English, the Fly-eater, as being Muggen sicener; in Season as Bellonius Writeth. The bigger fort of Zigaine, so called, seed on Flies which they catch as they fly, as Swallows do, and never miffe one, as I have taken a great deal of which they catch as they mysas of Flesh-flies, which we English call Maggets and Gentles, Fishesare very much taken with; Anglers use to fasten these to their hooks to catch Roch, Perche, Carp, and other fish withall, very good they are for that purpose especially if preserved in honey. Trouts are taken with the ground or Gaipath Fly, but chiefly with the dung Fly; so that the Anglers use to fasten one or two of them to their hook, and with a sporting, or rather curning snatching back of their Line, do invite the Trouts more greedily to bite, and the bair being swallowed down to hang the surer. Others put as many of those flies upon their hooks as they will hold, and plunge them quite down to the bottome, especially where they know the greater Trouts use to haunt, who are very defirous of the bait so laid before them, and by the their greedinesse become a proy, and lose their lives; as William Bruer informs me. The Fly called Phryganium (in English, the Cados Fly) serves for the like use, as also the Fly which usually sits upon mans ordine. But every moneth must have his several fly, for that which is for one moneth is not for another; the which the Fishers very well know, who in defect of the natural Fly do substitute artificial Flies made of wool, feathers, or divers kinde of filken colours, with which they coulen and deceive the Fifth. Only you must take heed that assoon as ever they bite, you pull your line to you, lest the Fish refuling the unfavoury bait get away. In the River Afraum there swim fish of divers colours feeding upon the native Fly that flies on the top of the water, which when the fishermen perceiyed, they began to catch of those kinde of Flies, and fasten them on their hooks. Now these Flies it seemeth as soon as ever they are touched lose their native colour, and so become altogether unuseful to fish withal. Wherefore they are fain to use aritificial ones made according to their shape and colour (as Elian reports). They add alfo to the purple wool, and divers coloured, made into the shape of that Fly, two cocks feathers of wax colour, and so exactly resemble the natural Fly. From whence we conclude this art of making Flies to be very ancient, and derived to usby long tract of time; however we have some bold bragging hookmen at this day that ascribe it to their own invention. Nor may we wonder that fishes and fishermen do so lie in wait to catch Flies; when as Domitian the Emperor thought it a work not unbeseeming Casar himself; who as Suetonius faith of him, with an iron pointed instrument stab'd all the Flies in his Chamber to the wals, as they stuck upon them, and would not leave so much as one; insomuch that when it was asked by any who was within with Cafar, the servants answered, Nemnsca quiden, no not fo much as a Fly.

But how strongly do those infirm creatures demonstrate the great power of God? Forconsider but the least Fly that is, and observe how in so little a body the most high God hath cuiriously fitted feet, wings, eyes, snout, and other parts, which yet are lesse than the least threed. How doth he out-fly a Fly of his own name ten times bigger then himself? doth he not excell all other Flies in running? doth he not pierce deeper with his mout, and draws out whole veffels of wine? The Elephant, that great monfter of creatures, is often exed and molested with Flies; and that they are able to tame the Lions, Affi shewes in his elegant Fable. The Horse, and Bear are not able to endure their biting much lesse then can the Sheep, and Asses, unlesse humane prudence came in for their aid, and did prevail against them. Hence came the invention of that which some make of Leather, rushes, or bristles which we call a Fly-flap: and that orbicular fan fastened to 2 Longslick made of the most choice Peacocks feathers, of which Propersine of old, makes men-

tion in this Distich:

Lambere qua turpes prohibet tua prandia Muscass Alitis eximia canda superba fuit.

That is to fay, That which forbids the nasty Fly thy dish to lick, Is Peacocks feathers fastened to a stick.

The Indians and Germans make these, the one of Oxes, the other of Foxes tails. Some make them of small willow twigs, others after another, manner ; the fashion whereof, Elian, Vegetim, Ovid, Grapaldus do exactly describe. Moreover, whereas the rugged skin of the Elephant is in flead of rail, mane, hair, (to speak in Plinies language) neither hath he any briftles to cover him. ortail to guard him, therefore men cover him all over with linnen or filk, the better to free him from the irksomnesse of the Flies, and to keep him safe that they may not come at his skin.

That Oxen and cattel be not annoyed with Flies, anoint them with oyl fryed in a frying-pan or with Lions greafe, and Flies will not fettle on them. The same will Origanum or wilde Marjoram effect, if rubbed till it be limber and spread upon them. If you anoint the hairs with the juice of the leaves of a gourd, you would not a little wonder how it will free them from Flies; this I have oftentimes made use of with profit. Selardanus. Bay-berries being made into a very small powder and boyled with oyl, have the same virtue, if they be anointed with them; as also the drivel or form of Oxen and Horses. Affricanus.

Oftentimes Flies get into the wounds and ulcers of cattel, so that by reason of the worms which they breed, there is added much malignity. First of all therefore, those ulcers being made clean, Columella applies an ointment made of Pisch, old Oyl, and Bacon greafe, both within and without; afterwards he applies Whey wingled with Ashes. Almost all the Summer long the ears of dogs are so exulcerated with Flies, that they often lose them quite. The which that it might be helped, they should be anointed with oyl.

The Fly Ophioborum (from eating or devouring of Serpents) gets close, saith Actius, between the scales of the Serpent Dryinam especially, insomuch that at length it kils him outright; this Fly from the colour of its wings is called of Helychius zanunuia, or the Brazen fly, because it resembles the colour of brasse, it feeds on black Beetles; and by biting begets in the Serpent extremity of heat, after that unquenchable thirst, and death followes: having fed upon the carkasses of

these Serpents, if asterwards they happen to bite a man, the wound is incurable and deadly, The Flies called Mordivora or Dung-flies are of divers forts: one is like the Flesh-fly but bigger, his eyes of a darkish red, shoulders black, in which there is a circle somewhat long and whiuh; the back black drawn over with crosso lines or streaks. The wings silver colour, longer then the body; most commonly they are seen about mens excrements, seldome otherwhere, There is also a Fly green all over, so resplendent and glittering as if it were transparent, the head denish, filver wings, frequently in the woods, and most commonly about dung; in bignesse equal to the common or ordinary fort of Flies. Whether it be that which Silvations cals Giacuall I know not. I have light upon another Fly called weeged pr. Dung-eater, leffe then the green Fly, the body dun, the head of a full red, with a line along the middle of it. I have another the body rough, yellowish, the eyes black standing out; the shoulders and back black, curiously spotted, the tail ash-colour. Another sly there is whose shoulders are of a pale red, somewhat towards a Saffron colour; it hath two horns longer then the rest, silver wings covering all the body; the head black, soursquare, and small, very frequently seen about horse-dung. To conclude about dunghils (from whence also it is probable they are generated) there are certain yellowish Flies, the body somewhat longer than the rest, and bunthing up; of whose generation we have before made mention. Also I saw another rare Fly, not every where to be met withal, that feeds on a mudwall made with mud and putrefied materials, it was black all over, only it had filver wings, and in the shoulders it hath four white spots, in the rest of the body eight, i.e. on each side four; the eyes white, the frontlet marked as it were with whiteasterisk or little star; out of which shoot out two black horns and long, it hath also upon the top of the thigh or shank a little white spot sprinkled up and down. This Fly I keep, though dead, in a box for the rarity of it. Bombilophagus, is a Fly, montanous, big, very black, the body rough, the eyes somewhat long, great, the head of a bright red; for his prey he fals siercely on the Humble-bee, and getting the better of him by flight, nimbly gets upon his back, and sticking close to him, doth so extremely bite, that he throwes him headlong to the ground, sucks out what honey he findes, and goeth away conqueror. In the top of Caremel hills Pennins affirms in his papers, that he saw it as long as the fight lasted; but the fortune of the battel falling to the Flies, the Humble-bees were put to the worst and slain. And thus much of the Zoophagi or the Flies that live upon living Creatures.

The Azosphagi so called, are those that make their living out of creatures without life, and those are either on the land, or in the water: of the land Flies, some feed only on the earth and the dew of it; others of plants, herbs, and flowers growing thereon. The one I call (in a term of my own) Ground-luckers, Humisuga; the other, Hearb-eaters, Herbivora. The Humisuga, ot Ground-fucker, hath a dun coloured body, in the head toward the mouth, a whitish shining spot, the belly and feet black, at the comming forth of the wings on both fides a white spot, the back grey, in the shoulders according to the length of them four sullied white lines, the wings silver, and (if they be put into the water) shining like the glo-worm: it is found in soot-paths, and

Mole-

Mole-heaps newly turned up; for it loves the ground that is made plain and smooth with Mole-neaps newly tunned up; to the distribution of the interesting on, and therefore called in English the Grappath Fly: it seldome comes upon flowers, treading on, and therefore called in English the Grappath Fly: it seldome comes upon flowers, especially at what time the Mole casts up fresh earth, of the juice whereof it is sustained.

of the Herbivora or those that feed on herbs of flowers there are divers forts or species: Of the Herbivora or those that leed of Lucian Falands, military or war flies. In regard they whereof three are like the Bee termed of Lucian Falands, military or war flies. In regard they whereor three are the the bee termed to look on, very gallarity let our with two filare bigger, littler, and ittonger, very inhalt a blackish head, the middle of the back being cit ver wings. The first and chief of these hath a blackish head, the middle of the back being cit ver wings. Inemurand the of the end of the tail black; the body otherwise mud cocroflewine with two overthis the head blackish, the shoulders according to the length of them drawn with three yellow and black lines, the reft of the body, marked alike and with the fame colours. The third and leaft of these, the shoulders are rough and yellow, the head red, the rest of the body is divided with four yellow and four black lines going acrosse it. The bodies of all of them do glitter, and as if they had nothing in them are transparent. They are convergne of all of them do gitter, and of the flowers. Lucian describes these military flies thus: There are in gardens, sucking the juice of the flowers. in gardens, the king the face of the same a kinde of Fly which some call Military, others Dog-flies, that make a very harsh and shrill noise, a kinde of Fly Wilfeld Thefe are very long livedy and continue all the winter without meat, and fly exceeding fwiftly. Thefe are very long livedy and continue all the winter without meat, especially when drawn together, and fastened to ridges and tops of houses.

In whom this is most worthy of admiration, that both of them do the naturall office both of mile and female, like the Son of Mercury and Venus, who was of a mixt nature or Hermophredite.

Much like to these is there another Fly called Apiaria, of a shining black, having two wings, gathering wax, and fastening the juice that he hath gathered from the flowers to his hinder legs, as the Bee doth: He comes abroad in Autumn, and is seldome seen at any other time. Whether this be that which Arift. cals Sirenis; it differs certainly in the number of wings only, for that he

makes to have four wings, whereas Nature hath afforded this but two.

There are other forts of Flies, that devour herbs and flowers, that are not like Bees, to wit, the Struthiopteri, Eninopteri, and Chelidonii, because it is like to the Swallow. Of the Struthiopteri, I have seen three forts. The first whereof is tender and fort, fix footed, with two wings, the belly longer then ordinary, sending forth from the head a little above the eyes two feathers like Offriches feathers, as it were horns of a downy foffnesse, as foft as any feathers whatsoever; crump shouldered, all the rest of the body white, longer then the wings which are black. The second is of the same colour, whitish, the head of a dusky colour; otherwise it differeth little or nothing at all from the former. The third is all alike, only the horns are not fo foft and downy; the tail is white, the body long, with five white lines going athwart it, the feet long, marked with black and white colours: as it goeth it lifteth up the fail a liftle, and fortly claps his two transparent wings together. These three species do appear in the Spring time with the fifth in gardens, hedges and shady places very frequently before and after rain.

The Erinopteros is a fly all over white or rather filver colour, small and every where downy, innsmuch as when it sits upon a flower, if you look not hard upon it, you would think it were a feather; the wings of it are divided, the feathers being severed one from the other almost like Birds wings. Pennius received one of these painted, from Edmund Knivet: afterwards he often

faw them in hedges, and places fer with privet.

The Fly called Chelidonius, is swifter of wing then all the rest, sides, tail, head, brown and hairy, the eyes black and hanging out, the bill or rather the nose picked, out of the top of which that out two hotns; the top of the shoulders as also the back black, two filver wings, the forepart whereof do answer to the blacknesse of the feet: sometimes it fits in one place for a great while together, as if it were unmovable, but as foon as you come near it, its out of your fight before you can fay, What's this? and will not yeeld a jot to the Swallow (from whom it hath its name) for swiftnesse of slight. Pennius received another flower-Fly of the learned Carolus Clusius, blackhaving two filver wings, two dainty white eyes in the back, having feven yellow spots, in the midfl whereof is to be discerned a speck of black. There are Flies that are found in beans, of sundry colours, but especially of a pale purple, which I conceive do come of the smal worms called Mide. For when they are gone (which is in the midft of Summer) suddenly there comes forth a great number of those Flies swarming amongst the Beans. The Fly of Napellus I have not seen but those that come out of those black grains that flick to the flalk of the wormwood much less than Millet seed, more black than any Moor, only famous for their wonderful smalnesse.

There is a certain Fly called infiness, very rare and wonderful, whether you respect the form of the shortnesse of its life. It hath many names: Alian calleth it ionues: Helychian parques! of others it is called hueision; in Latine, Diaria: it moves with four wings and as many feet; for that it hathnot peculiar to it in regard of the shortnesse of its life only (faith the Philosopher) have also so its life only (faith the Philosopher) have pher) but also as it is a four footed creature, and a flying creature. It comes forth with the Sun groweth, flourisheth, languisheth, and dieth the same day with the Sun setting. In the time of the Summer Solftice, these diary creatures break forth out of certain husks of putressed grapes, which husks (or fuch as feem to be fo) whether they are a kinde of Aurelia proceeding from fome kinde of canker-worms living in the water, it is not easie to shew; for in that particular the Philosopher is filent, from whom most of this story is gathered. Pliny cals them thin membranes; Arifa. small bottles, and faith they are common to be seen in the River Hippanes by the Cimmerian Both phorus of Pontus. They live a life both short and sweet, for they live not beyond the space of a

moral day, and in the evening they put an end as to their lives, so to their miseries. In the mean while they are fultained and kept alive with their own radical mostlure, neither are beholding either to all or earth; hence we may gather the length of their life, yea rather admire and ding either to all or earth; hence we may gather the length of their life, yea rather admire and with for it. These Insects Givers speaks of in the first of his "Lujant. Questioni; these also, Magthin Michoide' in his 2. Book de Sarmatja Europea describes in these words, You may take notice (saith he) that in the Rivers of Russia and Lieuania, especially in Borishbenes and Bosus, in the Summer there are a great company of the Flies called Ephemers, or Day Flies; they are Worms and Flies both some have foilt, others in wings; in the morning they run upon they feet over the water, about noon they shy about the banks; the sin setting, as many as every their the set of the sum of the set of the sum of the set of the said in the morning it is a creeping worm, then about noon a sty altogether, besides that he giveth to some fax wings contrary to the minde of Aris. In Scaliger in his learned Exercise Exercisions against Cardanus, describes this Fly after this manner. I have objected a kinde of Fly account of Sara and the Lake of Remannas, called Ephemers, in the evening, but never a line was the second. the morning, Sarca, and the Lake of Bennacum, called Ephemering, in the evening, but never any, in the morning, being taken it lived only a night; it hath four very long wings, how many feet I know not; but if it have ix (for I do not remember how many it hath) it sufficethe it hath a head like a Fly, great eyes, the spout or beak folled up together, the bally large, the tail area ding long and full of joynts, in the end forked, in some three forked, of colour a darkish yellow in the bigger fort, in the leller of a brown or dumith, very specious. The Taurini call this single Monietra as they would say Monachella. The Adriatick about Meranam and Tergester, call it curotulum, of my Countreythen it is called Sissopla, i.e. Sagitella. Elian lib. 2. de Animal. c. 4. fers forth another kinde of these Infects, such as are bred of fowre wine Lees, which when the veffell is opened come forth, and the fame day, for nature hath given them a beginning of life, but in regard of the many mileries to which it is incident, quickly freeth them of it, before they can be sensible of their own, or any others unhappiness. But yet what these Flies of which & lian peaketh be, unlesse they be those that we call Bibioner, I know not; for that our Vintners know of no other bred in their cask.

But Scalleger's Ephemerus, I should rather have reckoned amongst the Flies called pure empress, had not he himself referred it to this Classis. I shall not think it much also to speak of Pennius his Triemerus, or a Fly living three daies, for the likenesse of the one with the other, that so the mindes of the fludious may be filled with variety and rariey. It is of body very long, and fornewhar like a Butterfly, the head little and yellowish, the eyes great, black, standing out of the head, the promuse or beak winding in; of the colour of yellow mulleins, with which it sucketh dew from the flowers; two black cornicles fastened a little above the eyes, the back and belly blewith, the end of the cail dumish; it hath only four legs, the hindermost whereof are yellowish, the edges of the foremost black, it hath as many wings as feet, the outermost whereof are pale, wan, the utmost borders of them being of a dark yellow, the intermost of a brightish yellow. The outer wings when they are closed together for to cover the body, they are so contiguous, that you can birdly, year years hardly perceive where they touch; it flies heavily, and continues but a while in flight, within three daies it expires, it lives amongit Mallowes and Nettles, this was found at Peterborough in England in the year 82. Witnessed by very honest men and without exception. Thus Pennius,

Inflowers, or rather the buds of the flower called white Bers, there is a kinde of Fly that eats the flowers, very finall, I know not whether bred there, or coming thithen from fome other place. It feems they abide there for warmth fake and feeding, Pennine faith he was informed of this by his most learned friend Dr. Brown. I thought good to place the Fly Ribio in this number, because it is nourished by Wine, i.e. the clear juice of the grape (of which also it is bred). In the Illytian Tongue called Vinis robale; by the Germans, Wein Worme; in the Linglish, Wine Fly. Cardanus cals it Muscilio; Scaliger not amisse, Volucessam, and Vinulam; for it flies into cellars often, cares for nothing but wine. If you take it and look upon, it, you would think it had no mout or beak at all, and yet it is reported that they will firlke through a Cask made of inch board, insomuch that the wine sometime runneth all out. It may be Grapaldie meaneth these, when he writerh thus; The Mulcilla, Mulcula, Mulciones, Flies bred in Autumn in the mother of Wine. and foiling the Wine-cups, do not live to long (and that delevedly) as to come upon the table in the winter. In the West Countrey in a Town called Tanton, in the fruit of an Apple tree called Velin, in the Summer being rotten to the Core, there is found a gliffering fly of a green colour, which when the Apple is cut in twain, flies out, and feemeth to be bred there of forme kinde of worm that is in it.

The wounds made by any of these Flies, must be anointed with birter Almonds bruised, or Remedies as Walnuts; when ulcers are made, it is fit to pour on liquid Pitch boyled with Hogs-greafe. Those gainst Flythings that kill and drive away the Tyke-flies called Ricim, for the most part kill and drive away bitings.

the Dog-flies. Columella.

The Fly also by his boldnesse and saucinesse, hath taught men how to provide remedies against them; for whereas both at home and abroad, every where they were to troublesome, that nothing could be so safely kept by the Cook, but presently they would be at it and spoil it, yea all kinde of meats what soever, they now use to strew or stick up in their houses, or boyl and mingle with fuch kinde of things as Flies love, Nigella feed, Elder, Lawrel, Cortander, Hellebore, Buglosse, Borage, Sage, Beets, Loose-strife, Origanum, Basil royal, Henbane, Licebane, Balm, a Mmmm.

GHAPO E.

The Theater of Infects: or, Thrub having a flower like a Rose, Pepper, Penila, Cockie, Libbaids hane; some give them Organien powdered with Milk or sweet Wine, and sprinkle it about. That is writeth that Crocodie Broth chaseth away Flies; who also commends the persume of yellow Arienick, with Olibanum, persume of Virioli writing Ink tempered with water wherein Wormwood high been washed keeps the flies from the letters. Plin. The seed of Flentane, black Eligbore, and the Froth of Repair of the flies from the letters. Plin. The seed of Flentane, black Eligbore, and the Froth of Chickster with Barry flower heaten and kneaded, and made into little moriels with Butter of Chickster with Barry flower heaten and kneaded, and made into little moriels with Butter of Chickster with Barry flower beaten and kneaded, and made into little moriels with Butter of the Flies and smeared with a little holley, and to talk to the flies kils them. Aring. The gall of a Flare find little with the herb Balm. This is all the flies together into one place, care this doctaphne, with punited into a Wolf in the house, and the flies will not come little. Rhalip, Aucen, Albertin. Booss greate wild Rosin medical entangles them, Oyl choaks them, Verdigreas kils them our ight. If you know that Casta beaten in oyl, it will be fare from files. There is found in my Countries (lath Persus Coeffensius) a kinde of Toaddoot or Mushrone, broad and thicks, reddifn about the tops which tendeth forth certain knobs or little bunches, some broken, some whole; it is called the Flies Magarane, because when it is made into a puliets with milk, it destroyes the flies. the the flies Masterome; because when it is made into a pulters with milk, it destroyeth the flies With honey, yet will not the flies come at him, & by this means you may know, whether the touch Mid noney, yet with the true of no. Actius. They write that the K.of Cambayes (on was brought up by poylon, who when he came to years, was all over to venomous; that flies at once lucking were flwon to death. when he came to years, was an enveryour may thut the other hard and it helpeth. Approalisms to death Straffger. If the fly get into one eye you may thut the other hard and it helpeth. Approalisms in Problems. If Camels charice to be itting by the Tabanas or Afilus (a kinde of Fly fo called) as it often coineth to pafle in Arabia, anoint them with Whiles greate and all forts of fish, and they will prefently be gone. Plin. Solion in Geoponicis, biddeth to sprinkle cattel with the decoction of Bay-borries; and both these files through a kinde of natural antipathy depart forthwith. If cattel be already flung with the Afilus Flysanoint them with Ceruse and water. The Tahani will die (saith Ponzettus) when you fet before them Oyl of the decoction of land Crocodiles, called Scinci bruited, with Hogs Heart & the flour of foot. Moreover let cattel be led to pasture in the evening the stars guiding them. The the day time let them be kept in folds with boughs laid under them, that they may lye the more eafily and quietly. Virgil. Or elfe let them be brought to the fides of thick woods where these slies by reason of the dulnetie of their fight cannot fly to freely. Sundry kindes of remedies against flies Ruellige upon Hippogrates, as also Apollonius and Brigging have preferibed more remedies against flies: Now after what manner Plies, do execute the Juffice of God, let us briefly let down. No Age buffill freak of that famous Army of Plies, with which that great Lord of Hodes of heaven and earth did of old correct the fury of Phanes, and of the Egyptians, being joying with hardness of hart, and yet the wicked Hypotrite did not come to himself, but wallowing till in the mice of fin without any fehit, did afterwards invite greater and more grievous judgements to fall upon Him! And that proud young gallant, who would needs ride to heaven upon his winged flead, Was dimounted and cast down by the Fly called Oestrum. Hercules also, although exceeding in firength, the Poets inform, that he was almost vanquished by flies. In the rime of Ky Rivallus, when as corruption of manners, and guilt had infected Britany, there came down from heaven showless of bloud, and those being dried away, did produce fearms of poysoned Flies, who it has did but once hire any man he presently died, as our Annals report. Nicolans Abantephinans an English man, being elected Pope in the year 1154, called by the name of Hadrian the fourth was choaked with a Fly flying into his mouth. Or pergensis. Others tay that he was killed with drinking a draught of water in which a fly was drowned: and that by the just subgeneric of God; who excommunicated Frederick Cefar, (whose surname was Barbarosa, or Emburba), and did interies all the Princes of Italy against him. Nauclerus out of Johannes Cremonensia. Anancient wirer reports also, that the Army of Julian the Apost are was grievoully intelled with mighty fwarms of flies; and Grillus faith that the Megarenfes were by them driven from their habitation. In the year 1348, great numbers of flies dropping out of the air, did cause in the Eastern Courtreys incredible notion welle and puries action; upon which followed such a Plague among the people, that scarce the tenth man among them was lest alive. In the year 1091, wonderful flore of strange flies did fly up and down many Countreys, who did sundry waies hurt the graffe, trees, cattel, and men allo. Cranzius. In the year 1143. a fort of fly about the bignesse of the common fort of flies, only of somewhat a longer body, did so fill the air, that for many miles together the Sun could not be feen, which were also very troublesome. Orspergensis in the year 1285. Charles King of France leading an Army into Spain, and making year with Peter King of Aragon, and Army of hige flies of divers colours fet upon the French, and flew them with they beaks, as it had been with swords. Marinens Siculus 1. 11, de Hisp. Reg. In the year 1. 78. about the middle of Angus, upon the top of the Temple of Brambium, there large every year a knum of flies which made linch a noise with their wings as if they would throw down the took Time the Reight told this as a first wing as if they would throw down the took of mills thy Bright told this to Pennius, a Physician, a man both learned and vertuous, and of no smill note with us. Hither may be referred that which prabe reports, lib, Georg. 3. That armongs the Romanca Plague did offen happen by realon of them informuch that they were fain to hir emen of purpose to catch them, who were payed according to the quantity more or lefe that they

caught. But how greatly they annoy the inhabitants of Africk, Apulia, Spain, Italy, and the caught. In the green of the grant of the grant of the Carehagnians, and the inhabitants of Hispaniola, belides Oviedus, let those Englishmen speak who accompanied that flower of Knighthood, and Maul of the Spanish pride, Francis Drake. As for those things which Apollonius, Fulgesius and Pliny, fabuloully and superstitiously related concerning Flies, I thought them unworthy of this place; and therefore those flies called Pifatides, Cypria, Eliades, Alea, and the rest of place; and the relt of meet invention I pals by. It that not be from the matter to tax invention I pals by. It that not be from the matter to tax in the midnedle of the ancient Gentiles, that we may thereby be taught to dift up our eyes to the true, a minimor, the God that doth indeed keep. Here away from us. Alt is faid of Herenles in performing divine Worthip, whereas he was almost killed by the Files, that he offered facilities to Japaners, called appropriate or the Flyway-driver, by which means they were presently, dispatcht turo, the River Alpheus, from whence

the was after outed called by the maine of Angarine or Fly-killer.

The Elans field invocate Mysgrus and Asynders that multistide of Flies might not cause a plague among te them. Pliny. He relates also how the Cyrenaicks were wont to worship Achor the god of Flies, that by his means they might be secured from being troubled with them. Pline more truly might have read this name Acaren or Ithekron; in stead of Achon; if the had heard of the Town Acaren where Bahal-zehub.i. e. the god of Flies, that famous Idol wied to be worshipped. Or spergensis saith that the Devil did very frequently appear in form of a Fly; whence it was that tome of the Heathens called their familiar spirit Masca or Fly: perchance alluding to that of Plantes: The track of the state of t

Hic pol musca est, mi parer, Sive profanum, sive publicum, nid clam illum babert potest : Quin adsit ibi illico & rem omnem tenet.

This man O my Eather is a Fly, nothing can be concealed from him, be it secret or publick, he is presently there, and knowes all the matter.

But away with those falle and filthy gods which, the Greeks therefore called Trupdaineras, because they did serve for bugbears perhaps for children, and ignorant and heathenish people, which we that are Christians, and professe the true Creator of all things, ought not at all to regard.

There is also said to be another use of flies. For Plurarch in his Artaxerxes relates that is was a law amongst a certain people, that who oper should be so bold as to laugh at and deride their Lawes and constitutions of state, was bound for twenty daies together in an open chell naked, all befineered with honey and milk, and so became a prey to the Flies and Bees, afterward when me daies were expired he was put into a womans habit, and thrown headlong down a mountain a which place of Pluranch (by the Translators leave) I think should be interpreted not Ciphone vinitius, but unitius Ciphi, anothted with sweet smelling oyntment. Of which kinde of punishment also spides makes mention in his Epigarus. There was likewise for greater offenders, a punishment of Boats, so called. For that he that was convict of high Treston, was clapt between two Boats with his head, hands and feet hanging out; for his drink he had milk and honey powred down his throat, with which also his head and hands were sprinkled, then being set against the Sun, he drew to him abundance of stinging slies, and within being sull of their worms, he putre-hed by little and little, and so died. Which kinde of examples of severity as the Ancients shewed to the guilty and criminous offenders; so on the other side the Spaniards in the Indies, use to dive numbers of the Innocents out of their houses, as the custome is among them, nakedall be-daybed with honey, and expose them in open air to the biting of most cruel slies. But for these things let Nemefis answer, who is at the back of cruel miscreants, yea may be said every moment to be present with them.

To conclude; the last use of Flies (and that not to be contemned neither) appears to be this. the whereis none of them passe a Summer, yet some of them do not live out a short day, we hould by them be put in minde of our own frailty, and of the uncertainty of this vanishing life; the which although preserved with all the dainty food that can be got, with the softest raiment, and all the best waies and means that may be for a short space, yet when it seems most to flouilly it on a sudden declines and scarce with the fly holds out an Autumn, much lesse a Winter; we are in Pindars account but induces, Daiesmen, i. e. of a daies continuance, and as the dream of a shadow. And with the slies, short liv'd, yea shorter liv'd then they, for the most short lived of them liveth a day, where is we have young children that survive not sometimes the sourth part of an hour. Away then thou Tyrant whoever thou are, make lawes as thou pleasest, persecute the godly, add impudence to thy strength, trouble and confound all things, give thy self up to all abominuble and filthy lusts; yet at length Jupiter shall scare away these stars, and after thou art dead, exercise thee with variety of torments.

CHAP. 13.

CHAP. XIII.

Arabick, Heagi; in Italian, Zenzala, Linzala, fanzara, THE Gnat is called in Hebrew [anzala; in Germane, mock, m' n' ucke schnack; slinger-braem; in Flanders, Messen; in Po-lony, Komer, Welchiemor; in Miscovy, Coomor; in Spanish; Mongaite & mosquito, whence our lony, Komer, Weiconcomor; in French, if it be leffer, Moucheron, if greater, Bordella; in English, separate and Muschite; in French, if it be leffer, Moucheron, if greater, Bordella; in English, tenmen call it a Oversioner; in Latine, Culer, perchance from its sting as Isidor saith, or trom the word culeum, which signifies the same with cornum a skin. But if I might be bold to give the Etymologie, I should rather read the word enticem, not calicem, a skin sly, because it most affects that: whence by way of Hieroglyphick it signifies a Lescher; because as the Gnat most aneces that : which and firskes till bloud come forth, io doth the Letcher: which Plantus seems to intimate, when as the Parasite, if I am not deceived, takes up an old fornicator for kissing his miltres too hard after this manner : Eho tunihili, cane culex, &c. What, art thou not ashamed thou gray-headed Gnat? I can scarce forbear to tell thee thine own.

The Greeks have no general word that comprehends all kindes of Gnats; as on the other fide the Latines want words for particular Gnats, with which the Greeks abound. Of the Greek words, not at feems to be most comprehensive, whence the Octeans worshipt Hercules by the name of Conopius, because he was thought to have driven all the Gnats out of their Countrey. The same Alexandrinus witnesseth that Apollo was called in Atrica Culicaris. The Baotians worshipt their god by the name of Apollo Parnopius, because he drave away their Gnats called in their language, merbres, fo Paulanias. But fince the Greeks have one herb they call marican, i.e. Culicularia of Gnathane, a remedy against all sorts of gnats, korned doth indeed seem to be the most general word. That is evident by the network coverlid spread on beds, taken from the Greeks which they call notworks, and we also at this day name not much unlike, a canopy, a thing to catch all manner of Gnats.

The Gnat seems to be a kinde of Fly, yet as flies love sweet things, Gnats love things sowre and tart. The Flies do couple, the Gnats do not. They are most troublesome in the day time, these in the night, they make a kinde of a dull humming Hoise, these sing shrill, loudand pléafantly.

The Gnat hath two wings, for the bigness of his body great, coming forth of his cromp shoulders, he hath fix long crooked feambling legs going in and out, growing from his prominent square breast, with which as Arif. saith, they with the more ease lift tip their bodies and go the berter; he hath a very long body, as also a shout or probofe three tisties as long as the flies have, with the sharp point whereof he breaks through the skin, and with the hollowness of his trunk he fucks bloud, which he makes use of in stead of a mouth and a rongue, Pliny. He makes a terrible Kal releasers found and great, for the bulk of his body, so that Homer in his Batrochomyomachia, makes themto give the fignal for the fight. Aristophanes in his Nubibus, in derifion of Socrates, brings in Cherepho, demanding whether the Gnats make that found with their mouth or with their tail. Yet in his Avidus hie terms them bevous, which the Scholiast expounds bevalent, farill finging. Their Probosits (satch Princises) feems to be given them by nature to suck bloud and to feed themselves withall; but we may not affent to him in this particular, even reason is against it, for that the Gnat when he turns towards one fings more shrill, but in turning away more flat; which could not posably be, if they made their found with their tail.

The structure or make of the Gnat there is no man but with Pliny may justly admire. For in there to small insects and as good as none almost, what reason is there? what force? what inextieable perfection? where hath nature placed so many senses in the Gnat? where his sight, where his fafte, where his smelling? where is begotten that terrible and great sound which that little body makes? with what curiosity are the wings sastened, and the shanks and legs to the body? an empty hollow place for a belly which causeth such a thirst after bloud, of mens especially but their dare wherewith they pierce the skin, how sharp is it? as in the biggest it cannot be perceived, so it is doubled with reciprocal art, that it might be sharp to break through the skin, and filulous to fuck the bloud.

Their mainers and conditions are very ill disposed, both in regard that by their good will they will wound none but the fairest; and also those that are asseep, harmlesse and thinking no hurt. Whence groweth the proverb of a very ill conditioned man, that he is ustraine dilustres, more mife bievous than the Guar. The Gnat certainly is a very mischievous little creature (to the Aliand language) annoying men both day and night, both with his noise and his sting; especially those that live near the fens or rivers. Of whom Tertullian against Marcion, and his fifth book speaketh thus: Endure, if thou be able, the trunk and launce of the Gnat; who doth not only offend the ear with the Prilinesse of his found, but with his launce strikes through the skin, yea and veins also.

The diffinction of Gnats is very perplex and obscure, it hath puzled all the Philosophers; which with the doubtful fense of words in Authors have almost confounded the things themselves. But to me they feem to differ especially in magnitude and malignity. For there are these several forts

of them, the bigger, leser, middlemost and least.

The bigger may be called they because they have their abode in fenny and murish places, there they are begotten, and there nouriflied, they have a very long flender body with two wings, which they never lift up above their body as the fly doth, but traight up from their shoulders, and those are very neat, polite and compleat as may be.

Of lesser living Creatures.

They abound in woods that grow near the fea and the fens, not only in Norway, Rullia, and other extreme cold regions (as Olaus Magnus hath observed) but in the West-Indies, in Hilbar niola, Peru; and in Italy, near Eridanus, l'adus, Adria, Argenta, where gieat 110 ce and very great ones are to be seen, terrible for biting, and venomous, piercing through a three double stocking and boots likewite, fometimes leaving behinde them impoytoned, hard blue tumors, fometimes minful bladders, sometime itching pimples, such as Hippocrates hath observed in his Epidemicks in the body of one Cyrus a Fuller being transick. Nay sometimes the vein being struck, they do fo fuck the bloud, that when they are gone with their bellies full, it would flow out in drops of its own accord, even as we see in horses when they are bitten of the fly called Tabanus. The Italians use to clothe themselves with leather for that purpose, but yet icarsely and not altogether by any means they can use, can they escape their trings. Whether or no these are the Strees inevitable of which Theophrastus speaks of in his Book de caust pl. s. cap. 4. I have not to speak for the present (saith the learned Scaliger) and it appears that they are the same, for that they are not bred in a place of free, thin and open air, but are bred and fed about fens and standing waters, as about Argenta, and the mouth of Padus. But if the be Styges, they have found out a very fit name for them from their hatred and malice, which the word sizes doth import. But those which are in the hotter Regions, and live by the sides of rivers and fens, are of a more fierce disposition, and sting more cruelly, as Massarus hath informed Gelner, and our countreymen the English under Captain Drake in their expedition into Hispaniola felt by experience. There are others formewhat leffe then there, nothing diffe ing in colour, form, and frame of body, but yet in disposition more milde, and sling lesse. In the Summer time they are in the shady places, in the Winter in mowy places neer hedges and bushes, sporting themselves in their swiftness of flight, and as it were trying the maftery in fleeing from this place to that. They feldome bite, and when they do bite they draw no bloud, but only a little falt sweaty matter which they seed upon; which causeth only a little hard and itching pimple to arise. These two species are especially termed of the Greeks reforms, others there are notwithstanding which have other names.

There are in England, especially in the north part thereof, two other forts of them, of a third and fourth bignesse, much lesse than the former, but amongst themselves not much differing in their dimensions. These like expert and well trained souldiers, alwaies march in an exact pyramidal Figure, and although in themselves infinite, yet not any one of them breaks his rank. Thus they move upwards and downwards, when as in the twinkling of an eye, and while you can fay, whit's this? they bring their Army into a square body, and presently again into wings; the which if you rout with a fly-flap, or with water (prinkled amongst them, or with a strong blast of breath, they will instantly rally again, and before you can give a fillip bring their whole body into a pyramidal figure. They being in great numbers, do much infest the faces and eyes of travellers, and bite them: fo many and fo frequent are they, that out of what kinde of worm they should have their original it cannot be imagined. Countrey people steppose them, and that not improbably, to be procreated of some corrupt moissure of the earth. These small Summer Gnats are most frequent in the moneth of May, and seem to be nourished with a watery vapour, for their intestine or ventricle is very small, white and welnigh invisible, full of a white frothy thin nior flure, and of little or no tenacity; sometimes they fly farther off from the water, and gather themselves in great companies about houses, as men passe over bridges they swarm about their heads, they love places that are without wind, they shun what they can a turbulent air, for by the troublesomenesse of the air they are differsted hither and thither. Those kind of Gnats are proper-

lycalled in English Midges.

Now we are to descend to other so t of Gnats, according as their names are given them in the "Rushe able the chief of these are these three, viz. Bunks, Air, Kill: of which in order. Empissis a universe element of Gnat living about rivers, especially about rocks, girt about the middle with a streak of voluments. It maketh a shril-like noise as the other kindes of Gnats do, whence Charephon in Aristopha- Co. Is melieved in the streak of voluments. It maketh a shril-like noise as the other kindes of Gnats do, whence Charephon in Aristopha- Co. Is melieved in the streak of voluments. It maketh a shril-like noise as the other he thought that the Empides did make that sound will be should be supposed to the streak of volume the streak of volume that the streak of volume that the streak of volume the streak of volume that the streak of volume th with their mouth or their tail? Hefichius also calleth this Empri, l'envor, or Oxe-eater, because be- reclaquiror, ing deceived by the authority of Aristotle, he thought the Oestrus Fly, came from them: the which we have declared before at large that they were procreated of Swallowes, if N Emilies piro) in W donaeldur &c. Arift. Hift. 5.c. 19. Which Theodorus Latines thus : Cultees Muliones ex Ascaridibus gignuntur, hocels Tipulus. The Gnats called Muliones are begotten of the Asarides, i.e. the Tipula. There Tipula for the most part come out of wells or standing waters, the earthly matter feeling to the bottome; for the mud first of all putrefying, becomes whitish, by and by after blackish, last of all bloud-red, when it is such, presently there come forth certain little red creatures called Algule, which remaining for a time, they move to their original, and afterwards come to Perfection; so that the Tipula so called, are carried by the water, then a few daies after they heave themselves above the water, hard and without motion; not long after the shell being broken, cometh forth the Empis, and fits there, till either moved by the wind or the Sun he be able to fly. Thus far Garas Neverthelesse (not to wrong a famous man) I should think it a very ease matter

Astaboras,

954

matter to shew where in many things he is out. Why doth he translate the Empides Muliones, who are faid not to live above a day, and feed only upon honey? which must needs be hard for them to get fo readily in Fens and Marishes. For I may well call (without wrong to the Judges ment either of Pliny or Penny) the Muliones as they call them, Melliones, for they neither care for Mules nor feed on them, but only upon Honey, the which they can smell at a great cistance. tor Mules not reed on them, but only appearance; they have a bill like a Wood-pecker, long and sharp, with which they devour in honey so greeding they have a bill like a Wood-pecker, long and sharp, with which they devour in honey so greedings. they have a builties a procedule, and so presently expire. In this also did Gaza trip, to say the least that may be, that he translates the word Ascarides by the word Tipule. For the Ascathe least that may be, that he transmited the vater, or otherwise) every man knowes do services (whether they come forth of the earth, or the water, or otherwise) every man knowes do services (whether they come forth or the earth, or the water, or otherwise). nifie little worms. Besides, the Tipula alwaies keep the top of the water, seldome or never go down to the bottom. Last of all, when as the Tipula themselves come of the Ascarides, who can rightly say that Ascarides are the Tipula?

in rigility lay time some some in e. Fig Gnat, not because it comes indeed from the fig-tree, but because it is fed and suttained by its fruit. For it is sprung of a certain worm that breeds in the Figs, which when nature cannot make her perfect work upon, nor bring to the sweetness and perfession of other Figs, lest she should make something in vain, by a certain quickning vertue. out of the grains of them being rotten and putrefied, the produceth these Gnats. Yet not so, as that the Gnat is the misepper, or besides the intention of Nature (as Scaliger hath learnedly obferved) or if it be, the truth is, the work by the bye is of more dignity than the main. Nature did propose to its self the persection of a wilde Fig, a thing not so much to be esteemed of: this the being not able to bring to passe, turns her self from so common a work, to an enterprise of greater weight, and produceth a Gnat which she effecteth. Concerning those Gnats Pliny hath these words: the wilde Fig-tree brings forth Gnats, these being defrauded of the nourishment they flould have received from their mother, being turned to rottenness, they go to the neighbouring Fig-tree, and with the often biting of the same fig-tree, and greedily feeding upon it, they let in the sun withall and set open a door for plenty of air to enter in at. Anon after they dellrov the milky moisture, and infancy of the fruit; which is done very easily and as it were of its own accord: and for that cause the wilde fig-tree is alwaies set before the fig-trees, that the wind, when the Gnats fly out of them, may carry them amongst the fig-trees, who assoon as they come into them, the figs swell and ripening of a sudden grow very big and full. Whence it is that the Greeks to expresse a woman great with childe and near her time (yea or newly conceived with childe) call her ithun (ui, lu, Gnat-bitten. Those kemb'd and curle lockt Pathicks and prostitutes of unnatural lust, were called from hence Capifricati, as witnesseth the Greek lambick, சில் கமுயாக்க தோக ட் பியர்ட்டு, Nemo comptess nife Caprificatus. There is no man that curls and trims his locks that is not Caprificatus. To this Caprification Turnebus thinks that Adrian the Empetor did allude, when he upbraids that effeminate Poet Florus with his Pathick obscenity under the term of round Gnats in a most bitter Sarcasm:

Florus had said, Ego noto Cafar effe, Ambulare per Britannos, Scythicas pati pruinas.

To whom Casar answereth, Ego nolo Florus esfe Ambulare per Tabernas; Latitare per popinas, Culices pati rotundos.

In English thus:

I would not Cafar be To travel Britany, To suffer Scythian cold.

I would not Florm bee To walk the Taverns free In Sculking Brothels hide, Or the round Gnats abide.

But what time these Gnats passe from the wilde sig to the sig-tree, they do it in such haste, that many of them leave either a foot or a wing behinde them. Now that they generated of the grains of the unripe fig, may be evident in that the wilde fig is left void of grains.

Crips (some call it oxest) so called of the Greeks, and To unifer, from biting or stinging, (for that the twinge the flesh, and with their biting cause an itching in the same) is a very small Gnat, not unlike the Corops, who although by his sitting upon the Fig it may seem the same Gnat spoken of before, called the; pieor udaign or to dout (as Theophraftus saith) is dain in the yau समात पंतर्शनीक में रेक में कितावें कामाद्याकात. Which place Pliny interprets thus: There is a kinde of Gnat very offensive to certain trees, as to the Oak, of whose moisture that is under the bark they are thought to be bred. Theophraftus cals all those wirms, what ever they be that are bred in the Elm, Naves, Rapes, Foley, the Mastick, Turpentine, and other trees, either with putrefaction or otherwise. These or the like, but a little bigger, Cursus in his 13. Book, saith are very hurtful to the orchard Walnuts, which are called of thole of Lions, Bordella, Bordells. Galens opinion is, they are great de vourers of Grapes. The moilture of the Elm included in its first growth in the leaves, or rather blad ders, it it dry up, is changed into these Cnipe. In the Autumn it brings forth other kinde of Gnats miny, small, and black, called Canchryes. Symphorianus. They do especially haunt and spoil was tered gardens, the crop and scrape most kindes of heibs. Velarandus Insulanus, an Apothecary at

Lions hath observed them very frequently to come forth of the middle or heart of the Oak Apples hiving a hole made into it; as also out of divers other herbs, not so much by reason of purcefiction, but rather out of the alteration of certain principles being digetted into a better nature by

Origen upon Exedus, faith that with these little creatures God did the third time take down the ploud heart of Pharaob: the which are hung in the air by the wings, but yet as it were invifible, and do so subtilly and quickly pierce the skin, that the fly which you cannot perceive flying, you may feel stinging. So all the ancient interpreters following Origen, expound the word warms. Only Tremelius (a very faithful interpreter of the Hebrew Text, and of facred Writ) is of another minde, who thinks this plague to be a swarm of such kinde of creatures, as if the Gnats and all other venemous and stinging slies joyning all their forces and coming together in troops and

(warms, had agreed as being fent by God to break the pride of the Egyptians.

They fly in the air aloft in manner of an Obelisk or Pyramide; especially in the evening, they play up and down by hedge fides, when it is hot and fair weather, they fly in the fun-fhine, against rain in the shade. It may be they are the same with those we call Midees, and doth not much differ from that which Albertus Cals Schaggen; the Italians, Zenzalis; the Heathen, Cinifes. There is a kinde of Gnat which the Greeks call wish's unlowers the Latines, Hercules : in floth and malice like to Drones, and never wound or hurt any but those of their own name and alliance; for as foon as they perceive other Gnits full of bloud and moitture, after they have fought with them, they take them for their prey and eat them; whereas they live idly and do nothing elie but teek for their food gotten by the labours of others. Our Ancestors have observed a kinde of Gnat to be bred in the fowre Lees of Wine. Which because they are not heard to sing or make any noise, I had rather think them to be those which Scaliger cals Vinula Musciliones, Wine-flies. Nor do I passe for the opinion of Niphus, in regard they detire sowre things, and retuse sweet: when as he himself saith elsewhere, that they are fed chiefly with the juice of Oxedung, than which nothing can be mo e sweet.

The English Gnats are not so stinging as others, nor do they raise so great pimples, but the leffer fort of them is the more cruel, and yet they leave nothing behinde them but a little itching spot, like a slea-biting. The Gnats in America, especially those they call Tesin, do so slash and out, that they will pierce through very thick cloathing. So that it is excellent foor to behold how ridiculously the barbarous people when they are bitten will frig and frisk, and sap with their hands their thighs, buttocks, shoulders, arms, sides, even as a carter doth his horses. The Gnats about Terra incognita, or New-found-Land, and Port Nicholas, as also in divers other Northern parts, neto be feen in great numbers, and of an extraordinary bigneffe, as the Sea-men and Olans magmulaffi.m. The cause of their multitude Cardanus attributes to the unintermitted heat and the length of the day. The cause of their bignesse to that watery and and unctuous mouthure which was gotten together by reason of the long cold. But forasmuch as in the horrer parts of the Indier, as Oviedus (and experience) retuneth the oare alrogether as great, and many more fores greater and store, Cardanus may well fatisfie himself, though he cannot do me.

Of the Generation of Gnats Natures secretaries do diversly dispute: Albertus faith their ma-The Generaterial is watery vapours. Aristotle denies that Gnats should be generated of Gnats unless by tion of Gnats. means of a little worm as Flies are. But fince that they do not use copulation, I do not perceive how that can be. Pierius was the first that taught how that Gnats do come of certain worms breeding in wood, when as yet every man knowes that Gnats are produced of worms in the Navem, Privet, Mastick, Turpentine, wilde Fig-tree, and other like Trees, as if feed were fown, and that

not by way of putrefaction, but animation.

Idid chance to finde (faith Bruerus) in a dirty filthy dirch an Infect with very long feer, which for the likenesse of the form, you would say was one of the larger fort of Gnats coming forth of afost leathern purse. I did imagine that it might be bred of some worm like unto the canker that up therein: for the shell within was such as those the cankers transform themselves into: Whether it should be called Culex, a greater Gnat, or see 20 it is doubted by the Author. To these (as to all other the like hurtfull Insects) the merciful Creator harh granted but a very short life, informuch that they which are bred in Summer never live till Winter, and they that are bred in Winter never fee a Summer.

Yet notwithstanding God hath created them for diversuses, whether we respect God himself, The Use, or other creatures, or our felves. For not only Mynutis, Mynsis, Astabarani, Arrhotenses, Guavicani, were by the just judgement of God, driven our of their cities into deferes and foliandes. 25 Pansenias, Leo Afer, Alian, and the Indian Histories relate: but even the Agyptian Tyrant, of all that ever the earth bred, the most cruel, (as the sacred Scriptures that are more ancient then all the Heathenish Jupiters or other gods, do testufio) was vanquished with an Army of these. The leaft of those the Pope could not rid out of his throat, but was with one of them miserably choaled. With what a hercenesse did they charge the Army of Julian the Apostate? how did they make him turn his back, and fall down dead? Lee Apoltaces from the faith confider, and weigh the nitter well; let them think more seriously of the strength, power, and majesty of the Creafor when as they see such cruel stings and more sharp than any poynard whatsoever, to be in fich an ab ect contemptible creature as this is. Neither doch God make use of them to punish wicked and ungodly men, but also for the preservation and safety of mankinds. For about Merce and

Aftaboras, as Strabo reports, so great is the plenty and fierceness of the Lions, that unless they Affaboras, as strato reports, to great sting to that troops up and down all that Region) they were chafed away by a great kinde of Onat (that troops up and down all that Region) they were not able to live in latery, not in the most fenced Cities from their invation. The same is were not able to live in face; it Mesopotamia, as Ammianu Marcellinus writeth, where the Liwont to nappen in tone parts of Arguer and def and of any remedy against them throw themselves ons being stung with the Gnats, and def anded of any remedy against them throw themselves ons being tung with the Ghats, and designed deep. To the Egyptians also, although sometime headlong into rivers, and are drowned in the deep. heading into rivers, and are diswifed in the auxiliary to them, as Herodoms Witteth, in that they they were deadly enemies, yet are they now auxiliary to them, as Herodoms Witteth, in that they wound and sting to death the young Axille, before they get feathers, being noxious to them, wound and tung to death the young should feel be see of Bats, water Frogs, and bank Smallower, which Moreover were it not for them, the whole species of Bats, water Frogs, and bank Smallower, which moreover were it not to them, the upon them, would perish. But where is Gaza faith that the prey upon the Gnats and feed only upon them, would perish. prey upon the Ghats and feed only about the bird called Cnipologus (a kinde of Wood-picker with an alli-coloured back) doth eat, Ghats doth Bird Called Cnipologus (a kinde of vyood-please visual and a little worm that breedeth in the not agree with their nature. For that kinde of Bird feeds on a little worm that breedeth in the not agree with their matthe, the which he picketh out with his bill: He was deceived, it feemeth, rotten wood, called Coffus, the which he picketh out with his bill: He was deceived, it feemeth, rotten wood, cancer copies, the word, which fignifieth both those worms, and Gnats also, for so are by the Amphibology of the word, which fignifieth both those worms, and Gnats also, for so are by the Amphibology of the Holds, there were such a Bird, I should affirm without all doubt that they called in Greek with. But if there were such a Bird, I should affirm without all doubt that they called in Oleck which by Hefychius and Various is called Konopothera. The Grats called Pfenes it is the Nyctor, which by Hefychius and Various is called Konopothera. to state rycies, which by taking away their milky moiture, and by bringing in the Sun beams do cause Figs to ripen, by taking away their milky moiture, and by bringing in the Sun beams with them: and for that reason in those places where Figs do grow, they are bred in the wilde with them: and for that reason in the winds they may light amongst the fig-trees. By ng-tree, that nometice being stotal that Caprification is nothing elie but a certain skill how to which words of Pliny it is manifelt that Caprification is nothing elie but a certain skill how to cause the Gnats when bred in the green or raw wilde Fig, to fly to the Figs, that they by the wafling of their milky juice and mouture may bring them the fooner to maturity: the which is brought to passe two manner of waies: for either the wilde fig-trees were so disposed round about the Fig-trees, that wind might blow them thence unto them; or elfe wilde figs being gathered essewhere, and bound together in a bundle, were cast into the trees; and therefore the litthe beast like to a Beetle, called in Greek Megue, with his noise scaring away the Gnats, and feeding on them if he catch them, the Fig-keepers are wont to chase away and deliroy,

The Grats also seem to be more worthy esteem than the ordinary fort of Almanack-makers; for they will tell you the weather at all times for nothing, and that more certainly and truly, than they which boast themselves born by the Tripos of Apollo, and a long while brought up at Cuma. For if the Gnats near Sun-set do play up and down in open air, they preiage heat; if in the shade, warm and milde showres; but if they altogether sting those that passe by them, then expect coldweather and very much rain. When a Gnat comes forth of the Oak-apple about Michaelmas, it foretels war and hostility; if a Spider, dearth; if a worm, fertility and fruitinlness, Mizald. If any one would finde water either in a hill or valley, let him observe (lith Panano in Geopon.) the Sun-rifing, and where the Gnats white round in form of an Obelisk, underneath there is water to be found. Yea it Apomafaris deceive us not, dreams of Gnats do foretell news of war or a difease, and that so much the more dangerous as it shall be apprehended to approach the more principal parts of the body.

Upon a certain time there was feen in the air between the Monasteries of Sion and Shene in England, such a pitch'd battel of Gnats, that you could not see the Sun at mid-day. The fight was maintained for four hours, as long as the Armies could stand; at length a mighty stagistics being made on both sides, so many dead carkasses of Gnats were found in the hedges and highwaies, that they were feign to sweep the corn fields and medows with beesoms. Therefollowed upon this the banishment of the Monks in both the Monasteries. Stow. Whether this be true or no, I leave to those that can resolve such truths; I proceed to that may be of more certainty to be taken notice of.

Of great use are the Gnats unto us, when as the Fish called Thymallus (as Alian witnesseth) can be taken with no other bait then with Gnats. But as they are fometimes useful and profits ble, so are they for the most partivery irksome and troublesome, wherefore nature and experience have taught us remedies against them. To which end you may make a Fumigation or Persumeof Pomegranat Pills, Chamæleon, Thistle, Lupines, Wormwood, Grist, Pine, Fleabane, Elecampane, Cedar, Radish, Cummin, Rue, Hemp, Dung, Galbanum, Castoreum, Feavet-Itone, Hanshorn, Goats-hoofs, Elephants dung, Bimstone, Sulphur, and Vitriol, which will drive them

There are prescribed also these compound receipts: take roots of Elecampane 1 dram, Am moniacum, thymiama, storan, of each 2 drams; burnt shels 2 drams, put all these into the fire and perfume your cloathes. Another; Make powder of Harts-tongue, and with Viriol perfume them. Another; Take Wine-lees dryed, and Ceruse, of each alike, with Copperas and Ose dung. perfume them. Aetim. Another; Take Vitriol, wilde Gith seed, Cummin seed, of each alike, with Oxe dung, smoke them. Also the vapour of very strong Vinegar, and of Origanum, doth chale them away. Another; a Sponge dipt in Vinegar and burnt in the house drives them away. Wormwood, with Radish Oyl, by anointing preserveth from Gnats. Novus. Palladius advictors (principle agent 2) to sprinkle new Brine and Soor in the chambers of the house. Rue dipt in a decoction of Flexbane, and laid in the feveral corners of the house, kills the Gnats. Ruellius. If you make a circle of green wer Hemp about the bed, Gnats will not trouble you. Geopon. If you anoint your fell with Oul, or the Marrie To. with Oyl, or the Manna of Frankincense, they will presently be gone. The trees that grow in

watery gardens, and plants infelted with Ghate, are freed from them by burning of Gulbanum as Plint faith. But a prodigious, that I say not superstitious, remedy seemeth that of Rhast to be I know from what pugling Denieries he had it; hang forthe horse hair and make it fast in the middle of the door, and Chars will not come in at it. But why should Vinegar kill them, a think which they naturally defire and thirst after? unlesse it be the vapour of that thing that destroyeth them by taking away their breeth (as it often comes to passe) whose substance would nowish them. Apollonine Tyanens (an Targetes Chil. 2. hath left recorded) did to order the matter that no five Gnat could come into the Otties of Antivehin and Bizantinin. But fince we do not fee how that should be done, the less credit may be given to it.

The Grecians have deviced a kinds of tent of contring in manner of a net, of linnen, woollen. orfilk; which being hung about their dining rooms and beds, kept the Gnate from entring in Our Countreymenthat live about the Fens have invented a canopy (the first that ever I read of) with less costs but the same profit, which they call a Fen-canopy being made of a broad, plain, hilf dry somewhat hard piece, or many pieces together of Cowes dung, and these they hang at their beds feet : with the smell and juice whereof the Gnats being very much taken and feeding thereonall the night long, let them fleep quietly in their beds. without any diffurbance or moleflation at all, being sufficient reward for their pains so taken. In the day time they are kept off with a fly-flap made of Peacocks feathers or other the like things bound together; unless they be very numerous, and small Gnats, for then they will fly into the eyes, ears, nostrils, and mouth al-10, and taking greater courage to them, sting more sharply, notwithstanding these Remedies.

CHAP. XIV.

Of Butterflies.

THE Butterfly is called of the Greeks, when, whose, Idanes, also mentiones, musicus, ilo; Isidore, Avienta; the Italians, Farfalla; the French, Papillon; Papillon; the Spaniards, Mari-Ma; the Polonians, Motill; the Hungarian, Lowoldeck; the Illyrian, Pupiela, Meteyl, Motyl; the vermans, Pifnet, Mulk, Pfysholter, Summervnegel, Zweifalter; the Flandrians, Vleghebronfus, Bo-whyte; the Brabanters, Capelleken, Vlindere, Pellerin, Boter Vlieghe; the English, Butterfly.

The Butterfly is a volatile Infect, having four wings, not two (as Conflantinus Friburgenfis Description deamed) fix feet, two eyes flanding forth of his head, and two littler Cornicles growing forth from before his eyes: the Butterfly hath a two forked beak or bill, and within those forks is touched another little bill or beak, with which they fack in; forme the day dewy others the night. They couple sometime with their tails averse, sometimes reflex; and continue long in the act of Copulation. Copulation. They lay and fasten their Eggs, not little worms (as Aris. imagined) on the top and under the leaves, iome great, fome small, yellow, blew, blackish, white, green, some lesser then Millet feed, forme twice as big, others just as big; according to the colour and matural magnitude of each Butterfly. These eggs being laid in a warm place, or being cherished and caused to grow in the day time with the heat of the Suns beams, shoot forth a Palmer or canker-worm, ap the first all of one and the same colour with them, but afterwards, as they grow bigger they change their colour. Out of some eggs the Caterpillars appear at four daies end, others do not hatch before fourteen daies, which by little and little get strength and fly, but weakly; yea some of them being kept from the injuries of cold and hard weather, endure all the winter, as experience with sufficiently confirm in the Silk-worm. After copulation all the Butterflies do not presently debut live in a languishing condition, till winter, and some to the winter soffice; the seffer and weaker fort of them are very fhort lived; the more strong and hardy continue longer; they appear in the Spring time, out of the Canker-worms, Aurelia, go ving by the heat of the Sun, and by the temper of the air being in stead of a Midwife to them, they are brought forth. The coming of them is for the most part a fign of the Spring coming on, but yet not alwaies, nor in all places. For although they be very weak and not long lived; yet while we were writing, thus (faith Pliny) it was observed that their issue was thrice destroyed by cold weather coming again: and firange Birds about the 6, of the Kalends of February gave notice of the Springs approach; but a white after with a cruel bitter winter weather that incceeded, they were all delivoyed. We ought not to wonder that those foolish Icarian Astrologers having no ground for what they say, do tell us that which is false; whereas it doth appear by this, that Nature her self is inconstant; and we being more addicted to second causes than we should, and being unmindful of the first Mover, are deceived by her. Prinim reports of two fwarms of Butterflies in one Autumn. Now although I do not deny with long and sharp stolls they may all die, yet they are able to endure moderate cold, and do live in warm places even in very cold feafons. For how commonly are they found in houses skeeping all the Winter like Serpents and Bears, in windowes, in chinks and corners? where if the Spider do not chance to light on them, they live till the

Arif. faith that they all take their colour from the worm they are bred of: bur yet (if

this be granted) they have other colours belides, as wilk appear in their particular Descriptions and Histories, and so must address to send to the property of the send of the histories and the send of th

They most abound in the same of Mallowes blowings out of whose flowers when they have They more agound in the Emile of sale a fweet juice with whithehey refresh their bodies. Cothrust in their anous of provojens they mad at the speaketh of the Butterflies this Coupling, and beging lumella in his Books a Watternum L. D. c. 11. Speaketh of the Butterflies this Coupling, and beging lumella in his monner: The Batter figure couple after August; after they have compleable male firaight ning on this manner: I he marter prescompte all these things are so horribly strange that they was dies; out of their dung come, faith worms. But all these things are so horribly strange that they have no: shew of truth. Forther chief rime of coupling is in Mar and July: neither doth any have not them of truth. Fortunatives that the of that kinds of Burterslies of which Male of them die immediately after copulation; unless it be of that kinds of Burterslies of which those Caterpillars come which are called Silk-worms. To conclude, those things he suppose the suppose the suppose the suppose that the suppose the suppose the suppose the suppose the suppose that the suppose those Caterphians come of which come not worms, but a great many little Cankers, out to be dung, are indeed eggs a out of which come not worms, but a great many little Cankers, out of whose cases come Buttershies as there are of the Cankerworms: our of whose Am

Difference of Butterflies.

relie they proceed. They differ generally in that some styrabroads especially by night, these are called Phalens. Others only by day, which are called therefore, supreme, or Dayare called reserve. Other of Day-flies. The name Phalaina is a Rhodian and Cyprian word; for fo they (as Wicander the Scholiaf wirnesseth) call that Creature which flies to the candle, viz. (med in the out which I Turnebu out of Nicolans and Lycophron, will have odday to be taken for oddaya: of whom, became with the motion and force of its wings it, offentimes puts out the candles, is called worknessism, from the roughnesse, and the bran and meal which feems to be spread upon it, it is called sizes. And because some of them are so far taken with the love of the light, that they burn themselves because some of them are to tar taken with the love of the light, that they burn themselves with the slame, they are called Pyrausta. There are those that interpret this Phalaina to be the Cicindela or Glow-worm, but not rightly; forasmuch as the Glow-worm never desires the candle at all, but delights generally and chiefly in a dark night. The Germans call it ein Leight m' neken, ein Leight slugen; the Helvetians, Flatterschen; the Italians, Farfalla, Paviglione, and Powers; cour Northas also the West countreymen, call it Saulesi. e. Psychen, Animamsthe soul; because weig; our Northas also the West countreymen, call it Saulesi. e. Psychen, Animamsthe soul; because fome filly people in old time did fancy that the fouls of the dead did fly about in the night seeking light. Nicander describes a Phalaina thus: which Hieremias Martin interprets thus:

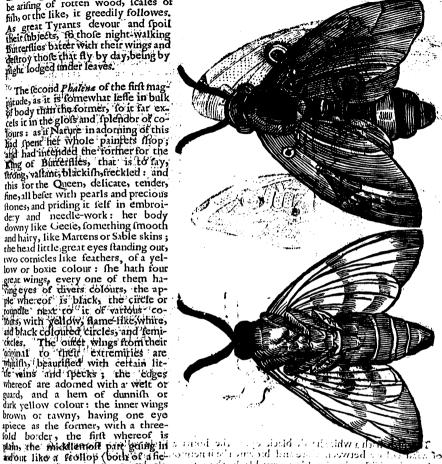

Consider what strange beafts rude Momphis breeds ; One like a flying worm, by candle light; wherein be playes as if he took delight: Driven from meats, whereon at night he feeds. His wings are narrow, of pale hue, not green, But more like ash-coloured to be feen.

From these things therefore we may gather this description of the Phalena, that it is a kinde of Butterfly flying in the night, most desirous of enjoying the light; from whence it takes its name, of a body rough, its wings powdered or fprinkled as it were with a fine kinde of aftes or duft; lying hid all the day time under leaves, or in fome obture place of recesse, in the night slying about the candles, and by its too much desire of them reducing it self into ashes: seldome or never it slies but with the wings standing upright on the back, as on the contrary the day Flies keep their wings even with their body. Homs they have for the most part, either rough and large, or very little and short : but the day Flies more long and tuberous in the extremity of them. The Phalene come our of the thels of the Canker-worm covered with earth. The day Flies from their Aprelia, either hanging upon or flicking unto the boughs of trees. They are for the most part rough, and as it were dufty, flying in the dark, very tender; these on the other side flying in the day light, are more plain, imooth, even, and have no dust upon them. They sly seldome in the day but toward the close of the evening, lest the dust that is upon them being dyed by the hear of the Sun and drowth should shake off, being never used to be wet with rain. But these are not able to fly by night, lest the night dew should wet them quie through, and hinder both their flight and their health: wherefore in rainy weather and all night they throwd themselves under the leaves, and never sly abroad but in clear and fair weather. The Phalene are no lelle affected with the candle than these with the day-light: wherefore these rejoyce at the day-star, that is to say, the Sun; but those at the night-star, to wit, the Moon, and Stars, and candle-light, refembling some, what the nature, splendor, and glimmering light of the Stars.

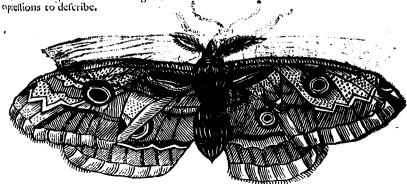

The Phalese are all either very big or very little. The bigger fort of the Mars their betty and also the infide of their wings altogether of a fandy colour. The eyes seem blue, the head blackish; between the eyes come out, two dusty coloured homs, Eagle coloured with black crosse lines wreathed like a rope. Upon the shoulders there is a kinde of any dusty coloured roll of wells. Some whom a little of the state of the eyes of the shoulders there is a kinde of any dusty coloured roll of wells. Some whom a little of the state of the end of dy dusky coloured roll or welt: from whence a black crosse spot is drawn to the end of the shoulders. The body if you look on the backside, is of a bright blue or azure, if on the bally is in a control of the state of the belly, it is of a fandy colour. The two outmost wings are very large and Eagle-coloured finely for with family for with finely fet with spots and white circles, the innermost are far lesse and yellowish, adorned in the infide with certain dusky streaks and spots; it hath thighs brawny and strong, all of a dusky screen and strong blinds dusky colour, and at the end forked and black. It flies with a great noise, and being blinde in in the night, what ever glistering there be arifing of rotten wood, scales of filh or the like, it greedily followes. As great Tyrants devour and spoil their hibjects, to those night-walking Birterflies batter with their wings and deftroy those that fly by day, being by night lodged under leaves.

CHAP. 14.

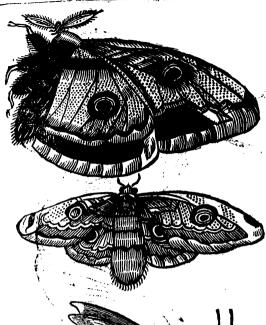

The second Phalene of the first magnitude, as it is formewhat leffe in bulk of body than the former, fo it far excels it in the glois and splendor of co-lours: as it Nature in adorning of this had spent her whole painters shop: and had intended the former for the King of Burterfiles, that is to fay, flrong, vallant; blackish, freckled: and this for the Queen, delicate, tender, fine, all befet with pearls and precious flones, and priding it felf in embroidery and needle-work: her body downy like Geete, formething smooth and hairy, like Martens or Sable skins ; the head little great eyes standing out, two cornicles like feathers, of a yellow or boxie colour: she hath four great wings, every one of them haple whereof is black, the circle or noundle next roll it of various co-lons, with yellow, flame-fike, white, ad black colonied circles, and femicicles. The outer wings from their organic to their extremities are multiply beautified with certain litthe reins and specks; the edges whereof are adorned with a west or guard, and a hem of dunnish or dirk yellow colour: the inner wings brown or tawny, having one eye spiece as the former, with a threefold border, the first whereof is ored and the the start of the s

ple white, and as it were forth on by forme Skinner or Furtier, fire goes upon from anyth banny thighs, of the fame colour with the rest of her body. This did Carolus Clusius send from Viout of so elegant and notable figure, that it is easier to wonder at and admire, than with he

,960

The third for hath a great body rough and blackith; each wing hath one eye, the fight or apple whereof is black, the roundle brown, the half circle white, There are divers pieces in the wings of a warry Amering colour, the edges of the wings at the first light appear ash-colour, afterwards Eagle-colour. The head very short and little, putteth forth on either fide a black eye, the apple whereof is of a notable whiteness, between those break forth two very small short horns of a dunnish colour. It is begotten of a rough Canker-worm, not a mooth.

The fourth hath a great dark coloured head, our of which arise two streight cornicles somewhat black, the neck is connicies comewnat black, the neck is addried with vermilion specks, the breft rough, square, duskish, the shoulders coal black, the belly of Amethyst or purple colour, divided with five or six circles or rounds; the feet black as pitch, the wings of a light brown, full of long black little wings. little veins.

The fifth hath a white head, black eyes, the horns a little yellow, the outmost wings long, of a fad colour between white and brown, the innermost being lightly and as it were by the by coloured reddish, the shoulders very black, the rest of the body somewhat of a rose colour bound about with seven black circles, a white line running all along the middle of the belly.

The fixth hath head and shoulders rough, and the utmost wings drawn with blond colour lines, are a white brown; the eyes of the head standing out, of a violet of azure colour; the inner wings somewhat of a carnation, represent the eye in the middle part, thining with the apple crow black, the circle about it purple; the body like dried flesh, and a little smoak't, divided with fix roundles black and brown.

CHAP. 14.

The feventh hath the onter wings white, with certain brown spots here and there as if it were watered Chamblet; the neck ring'd about as it were with a red chamblet; the net king d about as it were with a red skin reaching all down the shoulders like a Fryers cowle; the head is red, the eyes pearl colour, the horns slame colour; the innermost wings of a shining red speckled black; the feet red, the belly all of the same colour, with seven incidures or clists of a deep red lead colour.

The eighth is almost all over brown, but the edges of the wings and the middle part of the horns are of vellow or box colour.

The ninth is almost like unto it, but that the edges of the wings are like black fand, it hath horns broad and bended, of a whity-brown colour, the middle of theoutermost wings stopped with a round white spot.

The tenth is of a like bignesse, all over of a white bown, but that the middle of the outermost wings is marked with a white spot, and the eye with a very black apple.

The head of the eleventh is tuberous, the horns lender, the body like clay trodden; otherwise the wings are all of a dark filver colour.

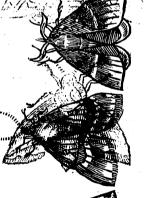

aluare Passat i vodre billores del reme e cassas

The twelfth somewhat of an ash-colour, the wings potted black, the eyes black, the apple white.

الأعام في المنظمة المن

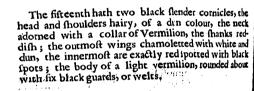

fure.

The fourteenth appears of colour various, it hath black tuberous horns; as also the eyes and feet; the shoulders are drest with five white plumes as it were, of which the two middlemost have three black specks; the wings snow white, bespeckled here and there with black, yellow and blew specks; the body ruste, resculate or jointed, the sides whitish, she puts hertail in or out as she pleasethait is sharp, yellowish, jointed; all the body as it were sprinkled with dust; otherwise in regard of the tuberous cornicles it had come in the number of the day Buttersies. It layest abundance of yellowish eggs, in the laying whereof she puts forth a little tail, which she puls in again at pleasures.

The fixteenth seems to be very rare: if you look upon it as it lies on its back, it seems to be all over of a murry colour; if as it lies, green and yellow; it hut five very red lines or streaks drawn along the shoulders; as also seven spots set quite through the middle of the back, do adorn the rest of the body: the wings allotte verst with murry spots or shadows rathers the beginning whereof from the head to the bottom of the breast is terminated with a line of whitish or silver colour.

The feventeenth, when it goes upon its feet and its wings close to its body, looketh din; but when it sieth with the wings stretcht forth, the innernos wires are carnation set about the edges, with a blackish lift or border: it hath very long comicles, and the promuscis or snour doubled in or rolled up together; the gray shoulders are marked with round sand color spots; the side also, and all the joynts of the body at set and edged about with hoary hairs.

CHAP. 14.

The eighteem. being very rare indeed; was sent me by Clusius. The hornes whereof pide colour, the head black as pitch; the nose crooked, the circle of the eye white, the neck scarlet or crimson; the shoulders being rough of hairy, are covered as it were with a sable mantle; the outer wings decked with a white and black hem; the innermost red speckled here and there with black spots; the body lack, as likewise the feet; but the sides of the body are set out on each side with seven bloud-colour spots.

Like unto this there was another fent, but with the cornicles altogether crow colour; and on the middle of the shoulders dressed with a pure white lift; as it were with a string of pearl.

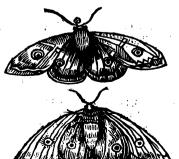

Of all these the bodies seem to be of a great big-

Now we shall addresse our discourse to the middle fort of Phalena.

The first of which is white all over, but only that the outer wings are bedawbed with certain black spots & freckles; and the innermost with very red specks and plangles white in the midst; the eyes very black, the feer and home yellowish; in stead of a nose there comes forth a rough

hair or briftle, the which is wound round up together like a roll.

The second, the whole body rough or hairy, and of a light red; and so are the outer wings, were it not for whitish spots, and hems that go about, and yellow little eyes in them; the cornicles being yellow, are marked with black spots; the inner wings are of the colour of the marygold, but adorned with eyes and hems like the former.

The third hath four white wings; the outer wings overcaft with little blew veins here and there plentifully, and two round blackish spots in the middle; the line that is about the wings is yellow, and the cornicles of the fame; the head and body black, the eyes exceeding white, the fides of the shoulders are marked with four very white oblique lines on each fide.

The Theater of Infacts: or,

The fourth hath broad horns of crane colour, the body black, the fides gray, the wings yellowish, all over besprinkled with black spots like dragons, broad at the top, and afterwards round; the edge of the wings like the Bats snagged, and as it were prickly, all over black, within six white specks; pearls being placed on each side do set it out.

The fifth is all over black, but that it hath pale reddiff spots up-

The fixth hart, the body and the conicles black, the system the vings are black underneath, above triplined with golden hairs upols; to which steply the first trads, run through with after to black the care it is common wings have a black border winding in and our, with gold laid underneath, and as it were wrought in and our wards a needle.

The seventh broad horned, the black body waxing hoary; I know not whether I may count it for a discredit or a grace to it. The beginning of the wings are red, the sail yellowish, but each part embossed with black toware spons and a bodder three drunning along the edges.

The eighth hath four comicles spreading wide, of ash-color, two of them very long and larger in the borders; the body like the former, the wings of a pale of colour, chequered with blus, and painted every where about the edges with drops of the same colour.

Of lesser living Creatures.

The ninth, the head, eyes, dornicles, body, and innermost wings do represent the golden ocre; the shoulders and outmost wings are black, but only for a black border, having on each side of it an ash-colour line.

The tenth hath its body yellow, bedropt with black from the neck to to the tail, both back and fides; the eyes, cornicles, and feet perfect black, the outermost wings white, but garnisht with borders of yellow, black small studs, and spots likewise.

The eleventh if you look on the wings, it is fnow or milk white, but only that it is all to be peckled with little black fpots; the shoulders also are white and down; the body and back yellow, and joynted, having eight little black spots; the eyes big and standing out of the head, between which sprout out two black and hairy cornicles. In the night time she slies about the meadowes and pastures.

The twelfth hath its wings so long that it can scarse fly; it hath very short cornicles, little very black small eyes, all the body else is white, being here and there sprinkled with certain yellow yeins and hairs.

The thirteenth (except its black eyes) is of a Crane-colour, fomewhat blackish; the cornicles more than ordinary long, the body rough and hairy, the wings of the same colour with the body, but about the edges glistering with a greenish, glasse varnish.

The fourteenth is a very rare one, though all over almost of a sand-colour; it hath cornicles for the bignesse of the body, strong, black, and crooked like the oxe, the eyes great and black, the head short, the neck thick; the outermost wings adorned with certain black studs; the ridge of the back is drest up as it were with five black heads of Gillislowers, three forked.

The fifteenth hath its wings of a pale ash-colour all over, amongst all the rest it is destitute of cornicles, the eyes are somewhat black; the back yellowish and set with five dusky coloured spots.

The fixteenth feemeth to be of the fame colour, but that it is streaked with black athwart the outermost wings: but this is every where of one colour (except the eyes which are black). It hath a long body, joynted, four long narrow wings, six feet, those behinde are twice as long as those before, it hath ilender cornicles but growing out very far.

17. This comes of the Caterpillar of a Silk-worm, white all over but the eyes, which are blackish, and certain small yellowish veins running straight over the wings, and crosse the joynts of the body: I call it the Silk-worm *Phalena*. Of which more in the story of the Silk-worms.

The least fort of Phalenz.

1. In the Classifier the least fort of all, we shall place one and the first very admirable, going on four very black feet; it hath the outer wings azure, the innermost yellow, and the innermost (which is not usual) less then the outermost; the yellow body also is so big, that the wings can scarce cover it; the cornicles are full of little points, and the eyes all but the sight blackish; the head and the shout (being long, slender, and rolled up together) are somewhat yellow.

2. The second appears blue and green, it hath a sittle body, the seet and cornicles blackish.

3. The third hath the floudders and wings greenish, of the colour of leek blades; the body dunnish; the outmost wings are guarded with a guard let with white and dun spors; it hath a very little head, the feet and the cornicles ash-colour.

Moreover there are found in houses a certain fort of little silver coloured Phalens, marked with black spots, which sty to the candles, called Mothes in English, which eat sinnen and woollen clothes, and layeggs, of which come Moths, and of the Moths again these Phalens; they are said to come sirft of all from rose leaves and other herbs putresying.

Three others I have observed in passures and medowes. The first whereof hath the outer wings black, each of them marked with 5 red pors like bloud, the innermost wings are all over red, the body dun, the head, short cornicles, and the feet blacksist. The second is all alike, only that it hath but four red spots in the outmost wings, and hath a more slender body. The third is almost of the like shape too, but the cornicles are a great deal longer, and the red spots scat-

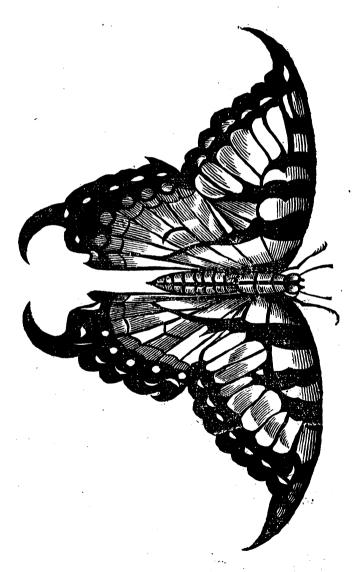

tered after another manner; for there appear about the edges of the wings only two red bloud-like spots; but from the rising of the wings two spots drawn at length. And thus much may suffice to be spoken of the night Butterflies, or *Phalens*; passe we on now to the day Butterflies.

CHAP. 14.

The Day Butterflies are to be described after such a fort, that all men may see the fruirfulness and elegancy of Nature in this behalf and admire. For she hath not lette played her part, or wrought hard rather in the variety of these, their colours, attire, rich apparel, roundles, knots, studs, borders, squares, fringes, decking, painting, making them, then she had done in the Phalens.

Of lesser living Creatures.

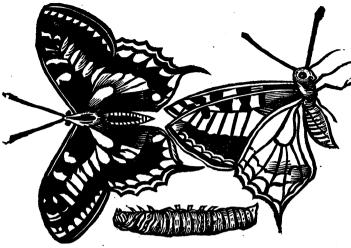

1. The first Day-Buttersly being the greatest of all, for the most part all yellowish, those places and parts excepted which are here blacked with inke. Moreover, the roundles of the iner wings are sky-colour, insomuch that you would think they were set with Saphire stones; the eyes are like the Chrysolite: the bignesse and form is so exactly set forth in the figure, that there needs no more to be said of it.

CHAP. 14.

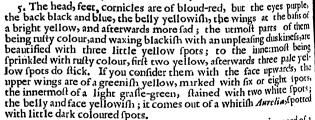

2. The fecond differs very little from the first but in big-nesse; it hath nevertheleffe, very black eyes & longer cornicles, where you fee the color white there suppose it yellow, except it be those great eyes at the end of the innermost wings, the apple whereof must be made flame-colour, but the semicircle bloud-red.

2. The third not much whike in colour, but that the extuberances, and the outmost border of the innermost wings is sky or woad-colour; as also those three taches which you see painted under the hollow part of them.

4. The fourth may be faid to be the Queen or chief of all, for in the uttermost part of the wings as it were four Adamants glistering in a beazil of Hyacinth, do shew wonderful rich, yea almost azle the Hyacinth and Adamant themselves; for they shine curiously like stars, and do cast about them sparks of the colour of the Rain-bow; by these marks it is so known, that it would be needless to describe the rest of the body though painted with variety of colours.

6. The upper wings without are blackish, with a certain gard of decayed red running through the midst; the extremities of them glister with white spots and specks like drops, being sharpned with disk coloured notches round about; but in the inside that guard doth shave of a more clear and full colour, and toward the bottome they seen blue; the undermost wings appear of one colour without, of another within, without they are all over sad coloured, except a reddish botter, with a prickly purse very small and blackish, marked with so little points, and two diverse coloured opals placed together; within the

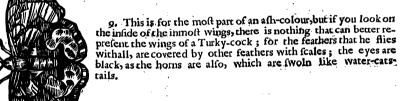

they show nothing like to this, but from a black and purle embroidery, they end in a sad fading ted, the body is black, the eyes, horns, seet, all dustry and of the same colour.

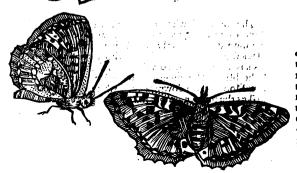

7. The wholebody is black, yet in every incifion of the back, it hath two white spots; se wings between yellow and red, adorned

with black and very white specks: but the bountifull Mother of all things, Dame Nature, hath chiefly beautified the borders of the wings, which have little teeth set like to says at an equal distance one from the other, in the border whereof 20 blue studs pierced through with black lines, make a glorious shew.

8. Nature bred this with a chamblet mingled coloured coat, but it wants lively colours, for the wings are of a black reddish fading yellow and ruffer colours, and it is more beautiful for its foft skin, than for its gallant apparel.

to. The body is black; the shoulders are covered with yellow down, as is also the whole head; the homs are yellow also toward the head, which appears the sadder by spot of a dark red; many round pearls ict at just distances, do make the outward's rounded skirt of all the wings to be more graceful; but withinside they are somely outwardly, like lintels. But as the part is less comely outwardly, like lintels. But as the part is less comely outwardly, it is part of the inmost wings, shiring with a whirtlift of the spots upon it, shires galantly: and those posts upon towardly from posts upon it, shires galantly: and those posts upon the sadder of the sadde

the length of the lift of original length of the inper will being in blue, the inper will being of a flaming sellow, best like fire painted with fix most black, guards, the root of the language is black, then they shine lift will be dellow to a fiery colour; the body is downy with darkish hairs, and the horns and feet are of the same colour.

12. It is wonderful beautiful, the wings are light bloud-colour, dipt with black spots, they shine with small long beams dispersedly drawn like threds to the very outmost of the coat, and this is adorned within with golden crooked lines like the Moon, being it self a murry, nicked on the sides like a Saw: the body is purple coloured from black, the eyes shine like gold, the feet and horns are black.

Book I.

13. The body and wings appear black, upon the black wings, jagged in the circumference, not hairs grow, then borders, and laftly golden fluds: affor the small eyes in the black head are tinclused with gold, but the horns grow forth with spots white and black, and end with a small very black knob.

14. It much delighteth in the curiofity of the decking of it; the body is rought and blackish from white, a black eye, and a white pupilla, about the bald eye you shall see a circle almost white as fnow, the horns are the same with the former, the outward face of the greater wing is known by the flaming colour, golden lines being drawn uponit, with four dinted skirts; about the end of it three round pence set triangular, do adomit. But the inward face of it feems most pleasant, with divers golden scales and fluds put like a coat of male, and tyles of a house: also a golden line beautifies the utmost part of the wings. It represents a Peacock very much by its Wings, and as that is, so hathir a proud and gallant body; the feet and legs are somewhat black, (lest it should be proud of its feature) the fnout is like a spiral line made uplike a Maze.

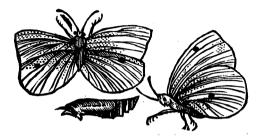

15. This hath also a hairy beak wreathed up like a vine tendrel; it is inwardly ash-coloured, and outwardly a faint gray, the wings are prickly, jagged like bats wings, some dun lines do outwardly part these, inwardly six black sinds do much set them forth.

The outward wings of all are a dark green in fight, which fome spots and pieces of white and yellowde beautific; the inward are perfectly red, being sprinkled with ten most black spots: the belly shines with eight yellow scales; the back is red inclining to yellow, and the tip of the tail is a light blue. The rough shoulders are commended by a yellow Moon drawn downwards, a white silver coloured apple makes the red eyes more sharp.

- I. The eyes feem yellowish, the The middle homs a decayed ruflet; the wings and fort of Dayall the rest of the body are a pale Buttershies, yellow; the inward wings are marked outwardly with one only full yellow spot, but inwardly they are tinetured with a certain black spot upon a warry green; the back is blackish from a blew, the belly is yellowish, it proceeds from an Aurelia coloured with gold.
- 2. The fecond is not fo pleafing a colour, the inward wings from a fading blew, decline to a Crane colour, and end as it were into a lead-colour, the outward wings are blacker, noted here and there with dark spots, and the body seems to be the same, it flies rudely with dented wings, and retched in the borders, and as it were prickly, and like a mourner of that kinde, it never comes forth but in mourning apparell.

3. We have painted out this, as it were stiffe and raising it self with the wings listed up, it hath also prickly dents, but the ontward wing from a pale yellow is marked with the black pieces; but the next part of the inward wing from the root is dark black, the middle part is pale, the last part is whitish, chequered with right and thwart sibres; the body appears dusky, the eye is black as pitch, the homs are black.

4. This is distinguished two waies; for when she opens either wing to ballance her body, the body shewes black, and four dark wings fastned to it ridged as it were with a black pencil, and ending in a shining rusty colour; but when it sits on flowers and lists up the wings, the first wing is yellowish, adorned with a comely round spot like a target, the colour whereof is pale, the boss of it black, the outward circle circon coloured; the belly, and breast, and the whole face are white; the black horns incline toward a yellow.

5. It feems infide and outfide all alike; the head and wings look pale; the body is wan, as alfo the horns; the eyes are flaming red, the shoulders are hairy with a pale down.

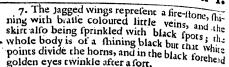

When it stretchesh its wings towards you, it appears a shining sandy colour, like herb dragon, with black spots: the body also if you see the back; seems a watry black, the belly somewhat more dark; they eye is black, clearwith a white or whitsh apple; the horns are black as a crow, the wings from you are of an unpleasant brown, and of a decayed Weefil-colour.

8. This hath the same kinde of body, but the horns are reddish from yellow, the wings appear changeable, marked with divers pleats, ridges, borders, skirts, of many colours: all these colours are sad and dull to the eye, they want all clearnesse and varnish, and are pleasant only in their mixture, placing, and number; in some places they represent a smoky slame, essewhere an unpleasing dark colour, and a fading red; and the rubies included in the last border in white semi-circles are nothing lively.

9. The outward wings are spotted with diry muddy spots, about the last part they are adorned with a black target, the middle whereof is set forth with an ivory point: the inward wings have four sinch targets, but augmented with a yellow circle besides; the two middlemost are of a sit magnitude, the two outmost are very small; the body of this creature is a whitish dark, the eyes that slick out are black: but if you look upon the inward part of the inmost wingsthey look snoky, and they are very beautifull, with six gilded leaves curiously disposed.

10. The head is a pure white, but fome dusky and black spots adom the milky wings, the back and sides are red from yellow, 9 or 10 black spots put under the cuts do adom them.

11. In proportion, and almost in colour and som of the body it represents the Eagle amongst birds of pres. I hath narrower wings than other Butterslies, it hath all it were broad feathery tail, the inward wings are not watty toloured, like the rest of the body, but red from yellows for or share colour; it hath a crooked nose like the Eagle, Abelly hoary, the horns are great and strongs of the same colour with the uppermost wings; the eyes are pretty well prominent, black, with a pupill white as snow.

12. This hath the same form, it only differs in colour. The body is ash-colour, the tail is black, and the back is something sliver coloured; the wings are long and blackish, and polluted with little black spots, the inward wings appear dusky dark coloured; both these kindes of Butterslies are wonderfull swift, and dare for flight to contend with the Eagle.

CHAP. 15.

13. This is the swiftest of all, and hath shoulders feeming of a yellow moss colour; the wings are white as milk, in the extremities of their they are marked with five or fix dusky feathers, the middle of the yellowish back is adorned with a cole black spot, of both sides two downy extuberances are thrust forth, the rump is compassed about with a certain black down, it will-sty as fast as any Swallow, and indeed is swifter than any Bird.

We have feen but eight of the finaller kinde.

1. The first parts of the inner wings are of a full bright shi-The smalning scarlet colour, and delicate red, but the outward wings he Day-represent a light purple, mingled of black and red, and drawn buttershies; over with some snow white spots, the rest of the body is black, even the branched horns also,

2. This is filver to lour at the foots of the wings, which afterwards are purple coloured from blue; the uppermost wings are graced inwardly with two black white study; the body is full of dusky spots; it hath six purple feet, three put forth on each side; it hath a crooked bill; out of the head four small horns break forth, besides the two long ones.

3. If you should see this fly, you would say that the wings are of a decayed purple colour passing to a lively blue, and all plighted severally, but inwardly there are round eyes, they seem shore gray and cankered; the head is blue from green, the body is the dusky and white laces; the eyes seem very black, and the apples of them very white:

4. It comes in a pleasant habit, with wings set with eyes, that are of a most heavenly incomparable blew. The most perfect artificer Native it self made it all eyes; that you would say directly, that Argue yes were not set into the Peacocks tail, but into the wings of this Buttersty, which she doth stretch out against the Sun with no lesse pride than the Peacock doth, and the heavenly colour which she excels in) she is almost able to shame the Peacock.

5. The body is of a Crane colour, the upper wings are green in a white stalk; in the middle they are yellow and ash-colour, the inferior wings are at the root of a dark green, otherwise whole, but inwardly they are sprinkled often with spots of an unpleasant green; the eyes are black, as are the heads of their horns.

6. It hath round buncht smooth shoulders, which are of the colour of ashes mingled with ink, the body is full of cuts, and is of an ash kinde of colour; it hath narrow wings, and the utmost are of a Crane colour shining with some exceeding bloud red drops, the little head, the feet, the horns at like the body in colour.

1 1 3. This

7. You would say, that this is kin to that is bred of Ginny pepper, and setting aside that it is sesse and more black in body, and the silver colour of his upper wings, it hardly differs from that.

8. All the wings are faint clay colour, or rather shining with a pule vellow, with some brown spots, and others that represent old cankered colours, the little eyes are black as a raven, otherwise it is all yellow.

9. All the wings are painted with white and gray like sea shell-fish, the borders are rounded, and deckt with white lines running through the middle with indentures.

10. This hath wings like Perwinkle shels, set with studs, it is mingled colour of a white and obscure red, and doth set forth to us the unspeakable power of God in the diversity of its colours.

Of the use of Butterflies.

He that beholds the forms, clothing, elegancy, and rich habits of the Butterflies, how canhe choose but admire the bountiful God, who is the Author and giver of so rich treasure? wherefore art thou proud in decking thy felf, and takelt so much delight in thy own beauty? possess thy temporary fading goods without envie, for know that there is no Butterfly but is as beautiful and pleating, and for the length of their life they have a more constant comelines than thou halt it may be an incredible agility of body, and numbleness in running, but yet 0 man it thou shouldest exceed all men, thou canst not equals a Butterfly. But you will reply that your cloathing is incomparable, and that you can boast of the Persian and Tyrian silk, of the best purple dyes, brought unto you by shipping: truly should you but see the rich robes of any Butterfly, besides their purple dyes, and the rowes of pearls, and the borders set with diamonds, rubies, the pyropus, opals, emrods; if you did but see and consider seriously the elaborate composition of their futures and joynts and the imbroidered work here and there, of fine divers coloured twine filk fet with study and eyes of gold and silver, thou wouldst let fall thy painted tail like the Peacock, and calling thy eyes down to the ground from whence thou wert made, thou wouldit learn to be more wife. It may be thou wert born at first in a house of clay and mud walls, or else in a palace built of polishedstones; but some Butterslies are born in their houses that are the Aurelia like to pure gold, and exceed Attalus for the excellency of their birth, and delicacy of their apparel. Learn therefore O mortal Man, who eyer thou art, that God that is best and greatest of all, made the butterfly to pull down thy pride, and by the shortness of their life (which is of no great continuance) be thou mindful of thy own failing condition. Welt thou as strong as Milo or Hercules, and wert fenced or guarded about with an hoft of Giants for force and valour; remember that such an Army was put to the worst by an army of Butterslies slying in Troops in the air, in the year 1104, and they hid the light of the Syn like a cloud. Licossbenes relates, that on the third day of August, 1543, th no hearb was left by reason of their multitudes, and they had devouced all the sweet dew and natural moistures and they had burn'd up the very graffe that was confumed with their dry dung. Also in the year 1553. as Sleidanus reports, a little before the death of Mauritim

Of lesser living Greatures. CHAP. 15. the Duke of Saxony, an infinite Army of Butterflies flew through great part of Germany, and did infeet the graffe, herbs, trees, houses and garments of men with bloudy drops, as though it had rained bloud. But it may be thou art in love with some semale beauty, and definest to please her: Ofool, remember the fate of the Phalena Butterfly, which being invited by the light of the candle, as by a fair beauty, is confumed by the flame it fell in love withall : and rejoycing like the Presulta bred in the fire, removing but a little from it is presently dead. And thou great Attrologer, who makest Aries to be the forerunner of the Spring, rather adore the Butterfly that is a certain mellenger of the Spring, and a more fure prophet than your horned Ram. Would you altime fifth to your hook, and catch them? hear what gallant baits are made, as we finde it in the Tarentine Geopon. Take I ounce of the venomous dung of Butterflies, Annifeed, Goats-milk cheefes

Hogs bloud, Galbanum, of each half an ounce, Opopanax 2 drams, beat them all diligently, and powring on good sharp Wine, make Troches, dry them in the Sun and keep them for your ufe. Castrels, and almost all birds of prey are freed from consumptions by feeding on Butterflies, and grow very fat thereby. Nicolaus in a composition of some powder, makes mention of burnt Butterflies; by which wo ds Turnebus understands Butterflies that fly to the candles: they came urine exceedingly, as almost all Insects do, but with less danger: moreover, fince they feed on dew alone, as do mails, and abhorto meddle with sharp corroding or shinking things, or such as have any venomous or malignant quality in them; truly the Colledge of Physicians are too wayward that dare prescribe a Spanish fly inwardly, yet never made an essay to know what force there is in Butterflies. Plinius faith wifely; That our greatest knowledge is very small compared to that we are ignorant of : for some small creatures upon the earth are despited, whose force, if we did know it, we should praise to the skies. You therefore sons of Asculapius, search out the vertues of Butterflies to be used inwardly and outwardly, for the health of the body; for had Butterflies been vieless, surely God would never have set them forth, bestowing so great liberality upon them. But fince they are not only for a remedy for us, but may do us much hurt, being inwardly taken in too great a quantity, as being poyson; I shall shew how that may be prevented, and diven off, if Ardiynus deceive me not. Phalena or night Butterflies, fuch as fly at candles at night, it may be were accounted of ancient time amongst dangerous medicaments, for the faire reason that Toads, Bats, Owls, Howlets and Gnats were; for they held that all living creatures that labour in the day were safe to be used; but night-workers most unhappy and accursed. Pling commends a Goats liver to drive them away, yet he shews not the means to use it. But if night Mothes go into a Bee-hive and trouble Bees in the night, bury dung mingled with the marrow, of an Oxe, and by the smell thereof these unquier disturbers will presently fall down. Columella. Palladius, in April, (for then they commonly do most hurt) places a brais vessel between the hives, that is high and narrow, and puts a lighted candle in the bottom of it, and they will come inthere for love of the light, and there they are half burnt, or choaked by the imoak in the narrow vessel. Bitter vetches are held amongst edible herbs, to prevail most against Bitterslies;

CHAP. XV.

great use and admirable.

others drive them away with smoak of Oith and Hemlock, as Rhasis: others hing a horse tail pulled off, upon the door, and they wittily believe that Moths are kept away thereby. Thus

much I had to tay of the divers use of Butterflies; who though some despite them, yet are they of

Of the Glow-worm.

THe Greeks have many names for this Insect, for from the shining of the shanks and tails it is Called Naumvels, πυρλαμπίς, κυσολεμπίς. Suidas calleth it πυρολαμπίς; Aristotle somunos; Heffthim, mogrodaume: it is also by way of metaphor perhaps called from the Latine word Scintilla a park, haumodo, & anrone. The same Author callern the male of it couses, because it is manifeles; but the female cannot be so called : some improperly call it oddawa, for it is one thing to covet the light, another to carry light with it. Those which Aristophanes calls withlus, some litte pret Cicindelas or Glow-worms, but upon what gound let them judge.

The Latines call it Gicindela, Notticula, Nitedula, Lucio, Lucula, Luciola, Flamus, Venus, Lucerunta, Incendula, as appears out of Cicero, Pliny, Scoppa, Agricola, Varro, Festus, Planens, Scaliger, Turnebus, Albertus, and Silvations. In Arabick they are called Allachatichi, that is to fay, bi.ds flying by night: in French Ver Inifant, Monch claire; of the Germans some call it Zinduerele, others Liegth mugh i.e. a shining fly, and Zindmurmle, speaking of the male. For in some places of Germany the male Glow-worm, that is that which flies, doth not shine at all, but only the semale called Grass-wurm, Gngle, and Feurchefer. About Francofurt on the Main, from the time in which they do most frequently appear they are called St. Johannis Kaefer, and St. Johannis Fliegen. In Brabant Ein light oft nacht muege. In Italian Lucicla, Lucio, Farfalla, although they grant this to be the name of other forts of flies that come about the candles. In Vincentia, Biffola fuogola, i.e. a fiery worm: in Cremona, Lucervola; Lombardy, Luiferela; in Spiin, Luriergana and Luciernega; Polonia, Zknosnike, Chazazezik, Wnory, Szwiecacy; in Hingary, Eyel swodorkle, bodoratska

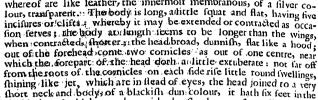

vilantio. In English, Glow-worm, Shine-worm, Glass-worm, i.e. a glislening or shining worm. For here, as also in Galconia, the male of flying Glow-worm shines not, but the semales which are meer worms. On the other fide in Italy, and in the County of Heidelberg, the females thine nor at all, and the males do. Heave the reason to be discussed by Philosophers.

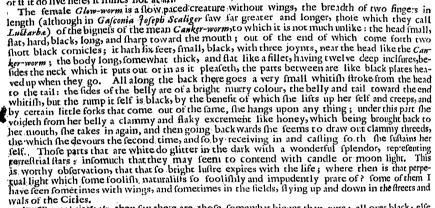

Their defeription.

Now the male Glow-worms have wings, the female are without, and that is in Europe it felf. The male Glow-worm of Europe, is a little creature flying, having four wings, the outermost whereof are like leather, the innermost membranous, of a silver co-

breast near unto the head, the hinder of which together with the shanks are of a yellowish colour, the rest of the feet blackish, it is slow, and creeps as it were with a grave pace; the breast buncheth forth alittle, the body, between the incitines or clifts whitish, at the tail it hath two spots, on each side one like a Moon, in clearing out of which cometh that shining brightness in the night, like burning brimstone, as if it did sparkle in the air: this never is seen in England,

or if it do live here, it shines not at all.

At Vincentia it Italy, they fay there are those somewhat bigger than ours; all over black; else

they differ not at all.

They feed upon herbs, they continue long in copulation, as Julius Scaliger (a great Philosowher of our times, not behinde any of the Ancients) hath diligently observed; whose words are these: Cicindelam volantem in coitu deprehendis &c. I lighted upon (faith he) the Cicindele or Glowworm flying with her male in the act of copulation; the male being touched did not refrain, they were put into a box with holes in it all night, the next day the male stuck close; at noon the male let go and died. After which time, about the evening many eggs were laid by the female, which within the Processor of twenty hours, went away alive. This itory William Brewer an Englishman, a learned man and my good friend affirms for truth, being an eye-witness thereof, seeing them once in the act of generation. They are long in the act, and so bring forth many infects, this the Philosopher confirms speaking of Insects thus in his 1. Book de gen. cap. ule. suprised ab mour zeros, she tarries long in copulation, but afterwards brings forth speedilg! I could wish Scaliger had took no tice what creatures came from those eggs, for to the story had been more perfolcuous. Though yet according to the course of nature it be easie to judge. For what could come out of them, but those small Eruca, black, thick, and rough, of which Arift. biff. 5. 19. faith those Glow-we rms Without wings are generated. Of these then come the unwinged Glow-worms, and of them with Some alteration the flying Glow-worms called Rostruchoi. From whence it is to be noted, that either Ariffettes copy is faulty, or that the interpreters have committed two errors; they have altogether left out the word made (which makes fo much for the clearing of the flory). Se-Condly, out of those being changed they say come those (which Gazatranslated) Cirros, altogether against the minde of the Philosopher, if the Greek copy be not corrupted. For so runs the Creek, En N invalour tree of Suction. &c. Out of certain black rough small worms cometh the Cicindele without wings; out of which in the second place being altered into a Chrysalis cometh the sying Glow-worm; and out of them in the third place those which are called Bostrachis. But what

Infects those should be which of the Greeks are so called Besieves, is not yet known, I beleeve there is not much difference between them and the former. Ephelius a Greek Author a Commentator on Aristorie, faith that the Bostruches are generated of the Clow-worm, and are called by the countrey people Circa or Plata; as Niphus translates Ricini, i. e. Tykes. Therefore in the judgement of Ephefius, that Bostruchos or Ricini take their original from the winged Cicindele with fome algeration. But of the Ricini or Tykes in their place. Calina 1. 9. Antiq. left. c. 4. Cirrhum inquit dicerem, &c. I had rather call the Cirrhus such a worm as that is, which according to Dioscorides, is of colour between black and white; but what that worm is, neither he nor any man else

I wonder at Cardane, who will have this Cicindele to come of the Crabrones, ascribing their felendor to the polishing of the outward skin. Ex Ernca in Grapiones Occ. From Ernca they besplendor to the polithing of the outward skill. Ex Ernca in Graprones, Occ. From Ernca they become Crabrones, or which is more likely, from Crabrones they become Ernca. For simuch as the Caterpillars called Ernca are bigger than the Crabrones or Beekles, and to hine more dimly, as it were spent with age, and then is it probable that when she craftly to sty. Here Cardane consounds all. For of the Crabrones come the Glow-morns, out of them, the Crabrones, Bailes it is not the smoothness of the skin that makes them shine, as he overhastily concludes, neither do the wings cause it, which of all the rest of the parts are most sleeks, what Cardan means by his last words, I cannot rell. But of all the rest Baptista Porta and Hespishim were grossy mistaken, who

They appear from the middle of June to the middle almost of September. Which Pling expresthey appear trott the initiative of fame to the initiative attention of perferences. Venich Plany expression in the Country are to be feen: and ellewhere, when Country worms appear, is in a common fign of the ripeness of Barby, and of somming Millet and Parnick. But this must be understood of the Country and place that Plany then lived in. In all Countreys they have not the same time of Barly harvest, nor of sawing Pannickend Milletsthough

Mantuan fang to the fame tune :

Then is the time your barly for to mow, When Glow-worms with bright wings themselves do show.

Yet as I faid before, the shiring comes not from their wings. They shine not before the twilight in the evening, as Politian showes elegantly :

> Then they renew their labour, till at night, The little Glow-worms shine most clear and bright.

Pliny cals these glittering Flies, earthly stars; Nature, saith he, crying one and speaking to country people in these words: Clown, wherefore dost thou behold the heavens t why dost thou seek after country people in these words: Clown, wherefore dost thou behold the heavens? why dost thou seek after the stars? when thou art now weary with short sleep, the nights are troublesome to thee. See I seater little stars in the grass, and I show them in the evening when thy labour is ended, and thou are miraculously allured to look upon them when thous pallest by; Dost thou not see how that a sight like size ited when she closeth her wings, and she carrieth both night and day with her: So far Pliny. Hence it is manifest that the shinning doth not alwains shew it self when she slies, though it shines forth both at her sides and thighs, because it suppears not but to those that see her wings wide open, and listed up, for where the wings are closed all the light is darkned. This slying Glowworm, Antonius Thylesius Bonsenius described elegantly in these verses:

This little fly shines in the air alones Like sparks of fire, which when it was unknown To me a boy, I stood then in great fear, Durst not attempt to touch it, or come near. May be this worm from hining in the night, Borrow'd its name, Shining like candle bright. The cauf one, but divers are the names, It shines or not, according as she frames Her felf to fly or stand; when she doth fly; You would believe 'swere sparkles in the skies' At a great distance you shall ever finde

Prepar'd with light and, lanthorn all this kinder Darkness cannot conceal her, round about Her candle shines, no winds can blow it out. Sometimes the flies as though the did defire Those that pass by to observe her fire; Which being nearer, feem to be as great, As sparks that fly when Smiths hot iron beat. When Pluto ravish d Proferpine, that Rape, For he was waiting on her, chang'd her hape, And lince that time, he fight, in the night Seeking her out with torch and candle light.

Those that are without as well as they that have wings do send forth such a bright lights that by it you may read a great print. In this also they surpass Moon and Stars, for that clouds and darkness soon eclipse their light; where it is so far from obscuring the lustre of those, that, it ra-

Thus far of those Glow-worms which are found in Entopes Amongst those that are found out of Europe, that which the Inhabitants of the leffer Spain call Cornia take the first place, because it yeelds a greater light, carrying a little torch before men in the dark. In Greek it may be called not made because the light comes not from the tail but the head. It seems to be a kinde of Beetle, fix times as big as the flying Glow-worm is

with us, not fo great as a hazle nut, faith Majolus, but sometimes bigger than two hazle nuts, in Jength two inches, and as thick as a mans little finger. Cardane faith well, that some of them are as big as the Hart-beetle; it hath a long head joyned to the body, the forepart whereof harh

Lis mi -100 -435.... 3103,

as it were in the middle a black (pot in a manner triangular; it shoots forth short horns; the eyes are very big (fo are the homs) standing out and black, and are placed near the mouth; the rest of the head is of a bright red, except it be two golden studs or bosses hard by the necks our of which the glittering rayes, especially when it flies and the wings are opened, do iffue with marvellous glory; fix black feet come forth of the breast; the Case wherewith the silver wings are covered, appears of a chefing colour; the body hath ten incifures or clifts of a blackish ashcolour. This Cicindele, together with the Figure of it came from a most skilful painters who had taken strict observation of it both in the leffer Spain and in Virginia. In Hispaniola they are almost all the year long, for they have feldome any winter.

In the Commentaries of Navigation this Glow-worm is thus described: The Cocnio is four times as big as our flying Glow-worm : it is of the kinde of Bactles: the eyes whereof shine like a candle, with whose brightness the air is so enlightned, that any man may in his chamber, read, write, or do any necessary business. Many of them joyned together make fuch a light that arrany may march by them whither they please, mangre all winds, darkness, rain or florms whatfoever. Their wings being lift up and also towards their thanks they thing very gloriously: the Inhabitants before the Spaniards came thither

made use of no other light, neither within nor without their houses. But the Spaniards (because these lightsome creatures do by little and little dose their light with their lives) do we within doors about their businesse lamps and candles. But if they are to march forth against an enemy newly arrived, they make use of them to conduct them, and each fouldier carrying four of whem about him, divers waies coulen the enemy, ... For when as that noble traveller Sir Tho. Cacomdiff (that compafied the world) and Robert Dudley Knight, fon to Robert Eark of Leicefer, full -tanded in the Indies, and that very hight that they came afhore, faw hard by in the woods an infinite number of moving candles and torches as it were beyond their expectation, they thinking the Bodicards were come upon them unawares with guns and piffold, and much light, speedily be rook them to their ships. Many other Insects of this kinde are there to be squade. But because this fearneth to be of most account, and to have the prehenunence above the rest, Oviedus hath left the rest undescribed. The Indians use to rub their faces with a paste made of them, that so their bodies may seem all of a flame. How this may be, since as is said before, the light vanisheth with the life, I do not see, unless it be that the light may endure a while after they are dead, but that long it cannot remain is manifest by experience.

The Indians finding so great need of them, in that they could not rest in the night for the Gnats flinging them (the which these Glow-worms being kept in the house did as greedily hunt after as Swallowes do Flies) and because they could not work by night without this lanthorn of nature, before such time as the Spanjards came thither; they bethought themselves of ome means whereby to catch them; the which I shall shew partly out of Peter Martyr, partly from those reports of others which were eye-witnesses of the fame.

Whereas the Indians, were constrained by reason of want of light to lie all the night idle, they got them out of doors with a lighted firebrand and crying aloud Guenie, cucnis they do so beat the air, that either for love of the light they fly to them, or for fear of the cold they fall to the ground; which some with leaves of trees, others with linten rags, othersome with little ners made for the purpose detain, till they can come to take them with their hands.

There are other little flying bealfs, which thine by night, but a great deal bigger than ours and sending forth a far greater light. For they shine so bright that those which take long journeys make them fast by a way to their heads and feet being alive; for so they may be seen afar off to the aftonishment of those that know not the matter: the women use noothe: light to do their business Withall by night within doors but these. Overduse

There are yet other worms of another form, which give light by night, as we read in the Commentaries of Navigation. In the Island called fiftherials, there are two forts of worms which

thine by night. Some of the length of a mans little finger, flender, with many feet, gliffening to bright in the darks that a man may see all round about him for fifty or an hundred paces early, That clear light shines forth only out of the clifts, b. if you will the junctures of the body hear the feer. There are others like to these in bigness, and altogether as lightiome; but only that their light issues from the head. Those things we finde in the histories of Navigation. But whether these Cicindela be of the kinde of of the Juli (as I think them to be); or whether they be like to ours, is not declared. But I guesse them to to be by the multitude of the feet they have; for the Author reckons them in the number of the Scolopenders! Valering Cordus in Diofcor. makes mention of the Scolopender (as he interprets it) whereas it is indeed a kinds of the Juli which in moilt places, and in rainy weather thine very bright. Such a one my friend Brever found in England in the heath grounds; and fent the worm dryed to Pennius. But that every man may better underland it. I hal fer down his own words : I twice found a Scolopendra that finnes in the night (yet as I faid they are kindes of Juli) in fummer nights, of ailliming nery appearance, inhealth and moffie grounds. The whole body thines tomething more darkly than a glow-worm. He further adds, It once hapned that I came swearing home to my hitister at might, that I wiped my head in the dark with a napkin, the napkin feemed to me all over on a flaring fire; whereupon T wondred a while at this new miracle, all the dutre feemed to draw to one place, then folding the napkin together, I called for a candle, and opening the cloth, I found such a Sectopendra, Which Thad rubbed against my head, and had caused this strange light like fired Thus far Brade at who affirms that it was like to the Scolopenders commonly to called in gardens, and under flones and earthen yessels, wherein women are wont to set their choicer plants or slips. All the Summer time and Augumn (faith Gaudentius Merula lib. 3. memor: c. 61.) In graffie ditches and without water when I was at Lebesium (which is now called Impearins fort) I gathefed lirile thining bairy worms in the night. The same I saw in the ditches about Viglevianum (which of old was called Vergeminum) as Simon Puteus and I were walking abroad in the evening to take the air. But what those hairy worms should be, unless they be a kinde of futi, I do not know. There is another worm altegether unlike these of which we read in the Book of the Nature of things: There is (faith he) a worm like a ftar, which shines like a ftar in the dark, it is never seen but in great rains, and then it foretels fair weather to come thortly after. So great is the coldness of this worm, that it will just like ice pur out the fire.

If a mang flesh be but couched with the slime of this wormsall his hair will come off; and whatfoever it touched therewith it changeth the colour of winto green. But all there he handleth intowardly, for he confounds the Stellia (which he here cals Stella) with the Salamender and Cicinatle, and of these hermaketh a very confused and imperfect History. Neither doth Guillerinus de Conche nor Vincentine (which transcribed all almost out of Guillerine) in his obscure and dark tract where he reports this flory, correct it. But these things are nothing to the Cicindeles and that which they write concerning the Salamander is other where amended Hitherto of Infects thining in I selve to marche

Whether or no the Glow-worm being dead doth retain its spendor and thining, is wont to be aquestion and Maffarine a veny learned man writing on Plity his 9. Books Mith it doths and that boyes taking the Clow-worms vifed to put about their heads the thining parts of them; with which if the hands or other parts of the body be rubbed, theyalls will thine in the dark, Bift by she leave of for igreat and learned a man las hories oxperience teacheth the contrary. For after the Glow-worm is dead, that part whereof which fo shineth in the night, though not presently, yet within a few hours after is quite loft; and feems altogerher to go away with the vital fritits: this is a cleangafe, from experience, and I have often tried the faine. This I will grant : if a cerain number of those that have no wings (for those that have, thine not but only when the Hy) bebut put into a clear Crystaligiais, so that the air may freely come at them, with a little grassific may perchance give light for the space of some x2 daies, it every day fresh grase be put to them; but at the length as they languish and faint away, so the light by little and little is remitted and lackned, and in the end they dying (as before is faid) it is corally extinguished in

Vainly therefore do fome boath of compositions made of them, with which they will keep perpetual light, as they suppose (amongst whom is Cardanas) as if they would bring down th Moon from heaven. Others the e are not learned only but tinitearned alfo, who have committee theie compositions to writing, whereby they might the better berray their own ignorance. this perpetual light Albertus makes mention, who in his Works gathers a whole bundle of fles together as it were into one body. And here now I will fet down some of them that the Reader may be aware of them, and the vanity and levity of the writers' themselves may be manifelted, Some there are which take a great many Glow-worms, beat them together, but them into a vial of glass and bury them fifteen dates in horse dung. Afterwards they diffil them through an Medical bick, and keep the water ind clear glass. To this end Gandentin's Merulas who hath heaped up many things to gether from this and that Author, without any judgement, hath these words of the Clow-worms deing putreflets, there is made a water, or a light tather, in a vellet which will wonarfully Bine in the dark. Such a light dorbethis water or liquor give, by report, that in the darkest any one may read and write, and do arty other business as he pleaseth. Others left they hould seem not roadd to what is invented to their hands (for pregnant wits inless they bring but some novelty are not well) together with the Glow-worms digest the gill of the Tortoile,

CHAP. 16.

of a Westel, and Sea-dog, puting them in dung, and afterwards they dittill them. This water they fay far excels all other whatfoever in luftre. Others put whole Glow-worms in dung for nine daies to digett, others for three weeks, then throwing away the Glow-worms, they take the far of them and keep it in a clean glats for to use. Some yet more fondly take Glow-worms, and Calling away their heads, they put to them the scales of fishes, and rotten shining wood, such as catting away their means, they put to their as gliffens in the dark, with the gals of Sea-dogs, and so distill them through an Alembick. Others promise considertly to make letters to shine in the dark, by pricking out the yellow moissure of the Glow-worm, and anointing therewith the paper, or painting it with the fame liquor in form of a stars some rub them with the oyl of Linited upon marble, and whatsoever you shall paint or or arrais to the first may easily read in the night, be it never to dark; but let them believe them that have made the trial. Others after they have digested in horse-dung nine daies, take the liquor that is lest in the bottome of the glass and write with it, and so think considertly to obtain their desire. John Arden, a skilful Chirurgeon, an English man, walking after their steps, above thirty years ago left fuch a description of this perpetual light in writing: He gathereth apove thirty years ago ten fuelt and fluts them in a glaffen veffel well stopt, laies them in dung fifteen daies, then puts the water he findes in the bottome of the glass into a clean glass; to which he adds as much of Quickfilver, the drofs being purged from it; and then he faith you must thut the glass mouth very close, and hang it where you will, and then for certain (as he affirms) it will produce the wished effect. Some have told me that this is very true, whom notwithstanding I will not believe untill such time as the experiment be made before mine eyes. These and many the like you may finde by reading, but what credit may be given to them is eafily conjectured out of what went before. Hence then we may plainly understand how foolishly and vainly mans wisdome doth many times vaunt it self, and whither our wits may be carried, if not founded upon right Reason, the mittress of all Arts and Sciences, shunning with all diligence the uncooth rocks of opinion and felf conceir.

How wonderful the works of God are in our eyes, none can be ignorant, who shall diligently consider this little creature and weigh its nature, and its light resembling that divine light. For who is he that beholds the vanishing light of this, that doth not fix the eyes of his minde upon Christ the lasting, true, and the chiefest light of the world; and doth not call to remembrance, that holy Spirit which doth illuminate our spirits in the most obscure darkness of our understandings? But this inbred light of the Glow-worm, or rather borrowed light which some seek to extract, others frive to imitate (as for example, Albertus, Cardan, Merula, Vitalia, Mizaldus) have shewed themselves very sools in my judgement. Neither have they been warned by the fatal end of Salmoneus or Alladius, who going about to imitate Jupiters thunder and lightning, were therewith by him fruck dead, and so did reap a just reward of that their impious prelumption, for they felt the force of true heavenly fire, who thought to counterfeit the like with a vain crackling. Even so the wits of these times, while they seek to extract this light, by their bold enterprize do violate the Deity, and while they would feem to adornand fet forth the glory of that his work, they rather detract from it and diffrace it. But we leave these to Ixions wheel, and proceedrather piously, and modestly to behold the majesty, wildome, and divine light in this little creature. For he which shall go about fully to search the majesty of the Creator in these small creatures shall soon be confounded with the glory of itac

What necessary use the Americans made of them in their might journeys and business, before the Spaniard brought in the use of Lamps and Torches, hath been said already.

But we that live in Europe, as we travelled by sight (I remember) in Italy and other places, we took a great deal of delight in them, not so much because they dispelled the darkness with the beams of their splendor, but because they did illustrate the earth with their celestial light, which compared with the light of the Sun and Moon, were not to be despised.

Neither do they only please the eye, and instruct the minde, but they are good for the body in divers diseases, for the semale Cicindele being put into the matrix of the mule, canfeth the woman that bears childe with much danger, to be barren; faith Kiranides. Cicindeles being drank in wine make the use of lust not only irksome but loathsome, as Benedittus saith; the same also Gilbertus an English Physician, Albertus, Nicolaus, Florentinus, and Rhasis do confidently affirm. It were worthily wisht therefore that that unclean fort of Letchers were with the frequent taking of these in Potion disabled, who spare neither wife, widow nor maid, but defile themselves with lust not fit to be mentioned. Rhasis saith that the Glow-worms are very good for the stone, if beaten with oil, and therewith the place having the hair clipt off, be anointed, which will never suffer it to grow afterwards. Bairns. If they be beaten and put behinde the ears, they will divert and evacuate all Rhumes falling into the eyes and teeth. Anonymus. The Inh bitants of the Isle Sorida take a good sufficient quantity of them, and mixing them with fresh black wax make them into a mais, and lay it in the hot fands till it be half confumed away: of this mais of the bigness of a walnut, both young and old do take two hours before meat and two hours after; which do not only infuse heat into the obscene pure, but vigour alfo. Thevetu. But this is not to be understood of the ordinary or common Cicindele, which as is aforefaid caufeth sterility and barrenness; by these Thevetus meaneth those Glow-worms reckoned amongst the kindes of Fuli, the which being taken in drink do after the same manner with the Cantharides, as Merula writeth, provoke both feed and urine. Alexins very highly

commends them for excellent baits to fish withall, being fastened to the hook. Weekerus sinh that by a gentle decocition of them in a glass Alembick, is made a water very infesult to that end. But I am rather of Alexius minde, the which experience also confirmeth.

CHAP. XVI.

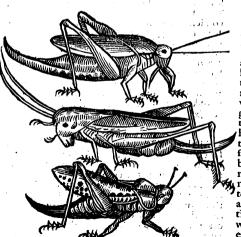

Of the Locusts.

He Locust, is called of the Arabian, Gieat, Gierad, Gerad; of the Illyrian, Kobilka, Bruck; of the Sclavonian, Knonick; of the French, Santerelle, Santereau, Langueste; of the Spaniard, Lagoulfa, Gafanhote, Gaphantoles; of the Italian, Cavalerto, Soliotta, Saltello; of the German, Hen-Chreck, Sprinckbaen, Sprinkell; of the Dutch, Hupperlinek; of the English, Grashopper, from leaping upon the geals; of the Latine, Locusta, as some think à locis ustu; for that they scorch all places where they touch, and eat up and devour all things; of the Hebrew, Arbeth; of the Polonian, Konick!, Szarancza; of the Hungarian, Saska; of the Greek, dupls, mued of aupas if asu-2001 g τρ φυτών τέμιος, whence comes the diminutive artistor, Locustula, vel Locustula, a little Locult. The Ionians call them from the number of their wings Tetrapleurides; that is to fay, four winged creatures; others call them Cornopas, Parnopas, and Pornopas; from whence Hercules and Apollo were called of the Athenians Parnopii, because they drave the Locusts out of their countrey, as Paufanias, Hermolaus, Calius Rhodoginus, Lilius Giraldus, Camersius, Strabo, &c. have observed. Notwithstanding the word parnops (if the interpreter of Aristophanes deceives us not) fignifieth that fort of Locuit only which is easie to be handled with the hands. But before we enter into the description and division of them into their several kindes, I cannot but admire with Marcellus Virgilius, the workmanship of Nature, in which I know not, as I may so say, whether she did more se jouily sport her self, or more sportingly labour. For who first of all is able to describe so many colours in one body? who is able to set forth so many divers shapes of bodies, goings, leapings, flyings. For some there are green, some black, some blue, some one part of them of this colour, on the other of another. There are those which are of another colour in their flight, then they seemed to be of before. There are some fly with one pair of wings, others with more; those that have no wings they leap, those that cannot either fly or leap, they walk; fome have longer shanks, some shorter, and amongst these some have more and shorter joynts, ome fewer and longer, some there are that sing, others are silent, as the Seriphie: some do no harm at all to tillage, fo that children may take them up in their hands without hurt: others on the contrary are the pest and destruction of all that up growes through a whole Coun-

And as there are many kindes of them in nature, so their names were almost infinite, which dough the neglect of Naturalists are grown our of use.

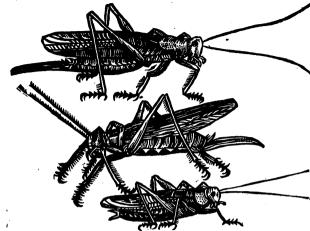

Now all Locusts are either winged or without wings. Of the winged, some are more common and ordinary, some more rare; of the common fort, we have seen six kindes all green, and the lesser of many colours.

The first of the bigger, hath as it were a grass cowle or hood which covers the head, neck, and almost half the body; the wings come from the neck underneath, of a greenish colour, speckled with a sew small black spors, the back green, the belly dusky coloured, the tail or sem, as the sind blackish; it hath a great mouthing and strong big teeth, excessed much in the second seems to be like this, but that the hood is fastened to the neck; the nose also and mouth are more red, and it hath greater spors in the wings of the third is of a green community of the third is of a green community. The second seems which is the tail blackish wings before with greater store of spots, and about the edges of a pale red.

CHAP. 16.

Now these are females, from whom the three males differ in this, that either in the end or above the tail they have two or three prickles or flings, and the middle of their hood appeareth more

The first fort of the lesser Locusts, called of the Tieurines, Holesspecht, is in body black, the utmost wings spotted, the innermost spattered with virmition; the thighs brown or swarthy, with black lines curiously drawn up and down. Of the se ond the cornicles, eyes, and shanks are of a pleasant red, the thighs or shanks are also diversified with black lines, the wings speckled, the belly of a dark reduponyellow, all which do exhibit a very fine pretty creature. The third feems to be of a dark alh-colour, the cornicles very short, and the wings of an unusual length, longer then the body. The fourth is all over of a darkish green, but that the hood is set with two black lines, and the ends of the shanks are of alively shining red. The fifth is a little lesser than the rest, but in ordering and variety of colour, more pleasant to the fight; the body, head, and feet are of a faint red, with green wings, and

<u>;</u>

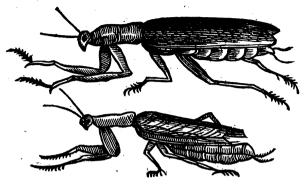

All those of the lesser sort have wings as long or longerthan their bodies, they have bondes no tang or prickle in their tail, nor bear any stem; they are seldome seen in the coin but altogether in meddowes and pastures, as I have seen them in France, and our Countrey of Britannie: I have feen only three kindes very rare, i. e. Italian, Greek, and Affrican: they are called Mantes, foretellers, either because by their coming (for they first of all appear) they do shew the Spring to be at hand, so And-

a golden lace drawn through the middle of the head

very bright and shining.

ereon the Poet fang; or else they foretell dearth and famine, as Calina the Scholiast of Theorium have observed. Or lastly, because it alwaies holds up its so effect like hands praying as it were after the manner of their Diviners, who in that gesture did pour out their supplications to

So divine a creature is this esteemed, that if a childe aske the way to such a place, she will stretch out one of her feet, and shew him the right way, and seldome or never misse. Her tail is two forked, armed with two briftly prickles: and as the refembleth those Diviners in the elevation of her hands, so also in likeness of motion; for they do not sport themselves as others do, nor leap, nor play; but walking foftly, the retains her modelty, and thewes forth a kinde of mature gravity. Though Pennius affirms that he often faw this kinde at Montpellier, yet in his papers he faith that he received the figure of it from the worthy Antonius Saracenus, a Phyfician of Geneva.

Another species of this Mantis, Carolus Clusius sent from Vienna exactly described, being brought thither out of Greece, which is like unto the former in shape and magnitude, but of another colour bestowed on it either by nature or the place where it lives; for it hath cornicles of a full yellow, the eye of hyacinth colour, the wings of a faint yellow, the rest of the body of Amethyst, only that the feet shanks, as also the joynts of them were more hairy and white, and the clawes of the fingers bended backward were black.

I procured one from Barbary that was brought out of Affrick with some cost to us, slender, five inches long, hooded, the head pyramidal, very long, out of which almost at the top came forth two little broad cornicles about an inch long, much like that Turbant, which the Tur-

kith Janizaries use with two feathers in it: a little below the root of it come forth two eyes landing out, great, and of a dark red, the body long, of a bloud red purple; the tail like a Swallow two forked, four wings of somewhat an ash-colour, deckt with certain dunnish spots; the four former feet and shanks very slender; the hinder strong, brawny, and long, and by reason of the spots drawn athwart all along the thighs blackish. And this of the common or ordinary and winged Locusts, and of the rarer forts shall suffice to have been said; unless the Reader shall think fit with me to add more differences of them. The face of the ordinary Locusts is fierce, long, wrinkled, fenced as it were with scales, which even cover the mouth: in the upper pare they have teeth fashned that are broad, black, and very hard, with which they easily ear ears of com, and scranch them with a great noise. The Greek and African Locust appears with a shoter face, and the teeth are so weak that it can feed on nothing but the softelt grass, and tops of hearbs. The common ones have very long horns, but the Manti have very thort ones; they have a hard breath, griftly, strong, none of these almost is faint or weak. They have also a soft belly, long and pointed, but there have a hardfull brawny belly; both of them have four wings that are skinny and membranous, as made of the fibres of nerves; for though the inward wing folded feems two, yet it is but one, when it is stretched forth: which deceived Todochme Willichine in his Dialogue of Locults, for his eyes deceived him, when he writ that Locults had fix wings, in his Dialogue of Locales, pleasant to behold in some Locales their thighs with six angles, exactly (mooth in their void places, and artificially painted in their netlike weavings together: the ordinary Locults have great eyes putting forth, whence Athenaus cals one Ebulus, lib. 10. c. ult. Ordinary Locuits have Bleat To patting of at large that Locusts could not see, as Pliny relates, lib. 11. cap. 37. yet have they clear eyes like glass, though covered with a horny membrane. Nature disproves this lie of Nigidius, which made their whole eye partake of feeing. As for colours, Nature that paints creatures, never was more bountiful in it, for though commonly with us they appear green, yet we see some of them red, yellow, crimson coloured, purple; and out of Morocco all white; and Alian faith, that in Arabia they are of a golden colour, lib. 10. 6-

neration.

Concerning the copulation of Locusts, I rather subscribe to Valeriola (who hath searched di-Their Copula- ligently into their nature) than to Aristotle himself. They couple, saith he, (as I have seen) by the male getting upon the female, at what time he puts those two prickles that come out of the end of his back into the matrix of the female, and so they continue in conjunction very close and for a long time, in so much they can scarce with your hands be pulled asunder when once coupled, neither by leaping and motions or any other way. The female being sickled underneath, moveth her womb very bufly, and applying being her felf with the bottome thereof to the male, doth hold him for a long while, sometime with the opening of the matrix, sometimes with the shutting or closing of it again, augmenting the pleasure of her venery: for while the matrix is open the male gets into the bottome or farther end thereof; and when it is contracted or closed, she is delighted with the affriction and tickling of the womb and the passages thereof. Now here are to be seen two passages in the secret part of the semale separated by a kinde of partition, and are covered over with a little thick cover, which in the outside is black, hard, and grilly, but within somewhat roughish, hairy and wrinkled; at the bottome of this the matrix anpears whitish like that of Women.

Now the female bringeth forth (as Aristor. faith) the little stem that growes to her tail, being fluck in the ground, and then layeth all her burden together in the same place, not scattering up and down, but as it were like a honey comb. Hence proceeds a kinde of little worm in the likeness of an egge, included in a little earthly thin membrane, the which being forced open, out come the Locusts and fly abroad. But (by the favour of so great a Philosopher) they lay eggs indeed in the beginning of Autumn, though not of the fashion of eggs, as I have seen with my eyes, and have had them in my hands. The which feture is so tender, that with the least touch it is harded as since in my hands. is bruised to pieces. Neither is it laid upon the superficies of the earth, but somewhat deeper, and in the winter under ground: where in the winter they being perfected by concoction, in the subsequent year, almost at the latter end of Spring they come forth out of the shell or membrane aforesaid, wherein they swere, being little blackish Locusts creeping up and down without either shanks or wings, which afterwards in a short time become bigger. They bring forth at the latter end of Summer, and when they have so done they forthwith die, certain little vermine breeding about their necks (as it happeneth to the Beetle) in the time of their bearing, which do strangle them. These dying after such a soolish fashion as they do, are yet able at their pleasure, any one of them, if it do but fasten on his chaps, to kill a Serpent. In a wet Spring the eggs perish, but in a dry then there is a great increase of them. Some will have them to be brought forth and to dye twice a year, (in the number of whom is Willichim) that is to say, at the rising of the Pleiades they come forth, and dye at the setting of the Dog-star, then others to be brought forth. Some say at the setting of Arthurus. In mountainy places, and of a thin air there breed no Locults, but in plains and places full of clifts and chaps; nor do they lay their egges upon the superficies, but in the chinks and caverns of the earth, both that they may be the better concocted, as also better preserved from cold and rain.

That they should be generated of the carkasse of a Mule or Asse (as Plutarch reports in the life of Cleonides) by putrefaction, I cannot with Philosophers determine; first, because it was permitted to the Jewes to feed on them: secondly, because no man ever yet was an eye-

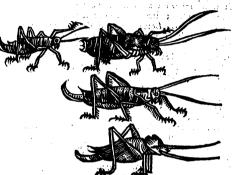

witness of such a putrid and ignoble generation of Locusts.

They dye several waies. For the male after copulation (wherein he tarries very long, and as it is probable, till all his radical moisture, and all his spirits at once are exhausted with his venery) presently expires. As in like manner all the females as soon as they have brought forth, whether with vehemency of pain, or numerous feture, I know not, the which being very great Cannot chuse but spend and exhaust the strength thereof. Oftentimes also great swames of them being lifted up into the air by the wand, which afterwards failing, they fall down into the tea, or flanding lakes. They are reported to pass over to far remote shores, continuing their journey for many daies together, they are to be seen very great, and also they make such a noise with their wings, that you would think they were a flight of birds, and they darken the Sun. They come oft-times out of Africk into Tiely in great numbers; biting and gnawing all with their teeth, even the doors of their houses. Neither do they hurt the corn fields, passures, meadows, The mischief gardens, orchards, with their biting only, but also with their black, burning (tinking ding, and espe-they do. cially with their cholerick and bitter fome or spittle, the which (as Valeriola witnesseth) they vent in great abundance out of their mouthes as they bite. Yet not with standing they are not venomous, the Parthians and certain of the Athiopians live of them, effecting them very dainty meat. They are faid in India to be three feet in length, their shanks and thighs when they are dry serving for sawes to saw withall. That sound or noise which they make Aristole saith is made with the rustling of their wings. But according to Pliny, it feems to proceed from the hinder How the Lopart of their head. But I suppose it is caused three manner of waies, by the grating of their teeth custs make a as they bire the herbs, with the clapping together of their wings as they flutter up and down with noise. them, with the rubbing of their hard neck and shoulders one against the other whilest they leap and themselves like souldiers armed with helmer and brestplate, are used to do.

Of leffer living Creatures.

Now we are to speak of the Locults which have no wings, and those especially are Bruchus. Asselabus, and Asellus.

The Bruchus taking his name from biting and devouring, may be called a Locust without wings 'And 78 Bestdestroying and devouring the herb of the held. Four forts or species of them are here presented turn i.e.

to view: the first is of the male, the second females. The Male hath a pale bloud colour circle or collar about his neck, under which hangs a double hood of a light yellow, and green, mixt; from the back to the tail it is fet out with fix leek coloured places running across from the back to both fides. The belly, which is fufficiently great, with the three prickles of the tail, are of the colour of an herb newly prest out of the earth, of a yellowish green, as also the thighes, face and cornicles; but the shanks seem reddish. The first of the females is all over eruginous, but for a bloud colour line running over the back from head to tail: it is without a prickle growing in the stem or tail; it feems also to be girt about with ten green plates, or rounds. The second is almost

allover of a light red and brewn, the belly a little yello wish, the upper end of the stem it hath two prickles. The third hath a head resembling a hogs or sea-cases head, in stead of cornicles it hath a little beard on each fide of the nose; the two bunches or swellings on the top of the forehead are like to the ears of a Bear, and it hath two prickles upon the stem very sharp and brown, of the same colour with the rest of the body. These did that samous knight Sir Edmund Kniver, freely fend in picture to Pennius for the enlargement of this work, for he is a Knight that is very courteous to learned men, and singularly noble both by descent and vertue, and famous for his curious search into the knowledge of natural things. The Latines call them Bruch; the Moscovites, Chreaft; the Polonians, Knonick, the Germans, Ramp; the English, field Crickets. Attelabus, is a small Locust, saith Hesychius, Pliny thinks it one of the smallest kinde; Hierome on the 3, chapter of the prophet Naum, cals the little off-pring of Locults Attelab; Aquila more fignificantly interprets them devourers. A little Locult is faid to be the mean between 2 locust and Bruchus; it hath such little wings that it is reputed to have none, and seems rather to creep than fly: for this cause wheresoever it is bred, it bringeth all as it were to meal or rult, by grinding and confuming. It feems to fome to be of the kinde of Bruchus, till the wings grow forth, and then it growes into the number of Locusts. Srephanus derives Attelabus from affin, because the wings seem so small as if it had none. The Attelabi, as Aristotle saith do breed in fallow fields, as Grashoppers do; they bring forth, and when they have brought forth they dye as other Locusts do; their eggs are spoiled by wet Autumns, when the waters increase too much; but in a dry Autumn, the Attelabi increase more, because their eggs escape drowning. Asellus, or 'Or as Dioscorides cals it, hath its name from its flow motion, it hath no wings, thick legs, but short withall, not like other Locusts, whence it seems rather to creep than leap, it hath agreat belly hanging down, as if it were made to devour corn. This Locust it may be is called in Scripture affdune, Nicander cals it maisat, and offeters; though, as Clitarchus faith, in the Dialect of the Ambraciata, all Locusts are called udazus, because they eat corn with a noise of their teeth. Franciscus Stancarus writ a little Tract of seven kindes of Locusts, according to the Scri-Ptures and Rabbins; but he described not those four which are numbred amongst clean birds that the Jewes might lawfully eat; those four were Arbeth, Salaam, Chargel, and Chagab, which the Chaldeans call Gebah, Rhaschen, Chargola, Chorgeba; and the Greeks call them anelda, spibuages, and affixacov. Arbeth is a kinde of Locust, called so from her fruitfulness, as Kimbi, Munster, and Broughton observe. The Septuagine have translated Salaam, affanor; Hierome doth not rightly

call it Scarabeum, for it is a flying creature, creeping with four feet, and leaping with its two hinder feet longer than the former feet. Kimchi makes it a kinde of Locult which the Rabbins ever it feems Niphus was to blinde that he thought it impossible for so small a creature to kill a Serpent, but we thought it fafer to relie on the testimonies of so many searned men, (who had a Serpent, but we thought a past and almost into all natural things) than upon the conjectures of so firvolous a Commentator and deviser of novelties. Hagab or Chagab is called Attelabus; Hierome voious a Commentation Amongs the Locusts spoken of, this is reckoned to be the last, and is set in the last Assacen. Antionger the bearing state of the last place, as likely to be the niost grievous; for this not only tasts of corn or shears it, but breaks and grinds stalk and all. It is bred of egges in a land fruitful for corn, which the semale left there when the corn was gone.

The Theater of Infects: or,

Kindes of

Five other kindes of Locusts are numbered up, Joel 1. Amos 4. Deut. 28. and Pfal. 78. namely Gaza, from sheating; Jelak, from licking; Chazil, from destroying; Thelatfal, from the blassing and rult it brings to corn; and Chenamal, from Raying; because where it sets up its station, it tarrieth there, and forfakes it not, Redulphus Moding on Leviticus and the Prophet feel reckons divers kindes of Bruchi; Tome are golden colour, others yellow, others gray; allo from a whitih worm in frothy dew that in May flicks to plants, a certain winged green creature is bred, in form like to the smallest kinde of Catterpillar, first it leaps, and and afterwards it slies, and therefore I think fit to call it Locustella, a little Locust. The English call that frothy matter Wood-fear, as if you would say the putters did not the wood. The Germans call it Cuckow-spittle: but what form that was of which Suides cals manuels; Celine, underest Nicander, manuels; Hest-was the control of the what form that was of which Surage cals markets Ceims affects a market, markets Help-chius, Opinara, anges, market, spans, Suradroud's Aristophanes, mayor's Bustanius, under Pha-vorinus, anges, and noutle's Islance Lindologhea, truly I cannot tell, and I would gladly see some Oedipus who would declare their nature and use. Bus because Marceline affirms that there are fome Locusts that use but two wings: and willichins ascribes to some six wings; they should either have described them, or have held their peace in a matter that exceeds belief. Also he flipt very abfurdly, when he affigned a King and a Monarchy to be amongst them. May be amongst many little ones he found one great one, and faluxed him for their King, because he excelled in magnitude; but Solomon, (that was of Philosophers and wife men the chief) saith they have no King, but are subject to a Common-wealth as Pismires are.

The mischiefs

How Godby these very little creatures did punish the pride and haughtiness, and hard heartedness of Pharaoh, is apparent enough out of Exedus, and is spoken of every where. In the year 170. before the birth of Christ, all the meadows almost were covered with clouds of Locults, and a hundred years after about Capua a great multitude of them filled the country, Julius of figures. In the year after Christ, 181. the war long enduring in Illyricum, France, Italy, and at Ital being ended, that nothing might be wanting to punish those Nations, an innumerable company of Locusts, and far greater than the ordinary ones, consumed all the grass round about. In the year of our Lord, 591. When Agilulphus reigned in Lombardy, a very great plenty of Locults afflicted the Countrey about Trens, which are reported to be brought out of Africa by force of the winds; but the greater part of them were cast down with storms and drowned: but they were no less hurtfull and deadly to the Italians; for by the waves they were brought to the fhores of Cyrenis, and by their venomous stinking smell, they caused such a plague amongst mortals, that Julius writes, that of men and cattel there died above 800000. Also at Venice, and about Brescia for want of corn, (for the Locusts had consumed all) so lamentable a plague sollowed, that in the year 1478, when these things hapned, above 30000, men died of it. Again in the years 593, 693, and 811, Locusts came flying out of Africa after a great drought, that devoured plants, herbs, and barks of trees, whence followed a strange famine, and such as is elegantly described by the Author of Naumachia, in these verses:

> -The nurse childe of death, Famine was present with her empty veins, The poor with hunger starved, their breath Was spent; for neither broth nor bread remains: Upon their mouthes and guts hunger laid holds They move their chaps, and bite their teeth, not meats Through wrinkled skin their bowels might be told: Nothing but skin and bone, they'd nought to eat, In stead of belly stood an empty place, The brest hung down, and seemed for to stay
> On the back bones rough grate, pale was the face,
> Lips white, eyes sunky teeth stark, all was like clay.

Nor was France free from their teeth and devouring, but in the years fince the time the Vitgin brought forth her fon, namely in the year 455, 874, 1337, 1353, 1374. Was miterably wagin brought to the confumed by famine, and very many killed by a plague that followed it, and fometimes it lost a third part of the inhabitants. These Locusts had commonly six wings, and were brought thither from the East. But at length by force of winds they were carried into the British Sea and drowned there: but by the flowing of the sea they were cast to the shore, and infected the air, and caused a plague no less cruel than the famine that went before. Othe Frishgensis. Also in the year 1476, they wasted almost all Polonia. In 1536. innumerable troops of Locusts were brought by winds from the Sea Enxinum into that part of Sarmatia which is called Podolia, they did change their camps in a military order, and they eat up, all that was in the fields where they pitched both by day and night; these of an unusual greatness at first wanted wings, then their wings growing forth, they flew at pleasure; and what shall I say? they ear not only herbs and leaves, and flowers, but hardly left any bark on the trees. Then they wandred through Germany, and came as far as Millan, and having devoured all there they returned to Polonia and Silefia. At last in November, for so long they lived, when they were consumed by force of cold, they raised such a stench, that had they not been eaten up by hogs, and wilde bores, they would have caused as great a plague, as they had done a famine in Germany and Italy. In the year 1543, Locusts did a very great muchief to the Countreys of Misnia and Marchia: at which time they were so frequent in Lucania, that being in heaps they were above a cubit high. facobus Ekcelius. In the year 1553, it is commonly known what great dammage the mighty company of Locusts did at Arles: whilest we were writing this, we received news that the Spaniards were forely afflicted with swarms of Locusts brought thither out of Africa. For they flew like Armies through the skies, and darkned the air. And the people when they faw them, rang all their bels, shot off ordinance, sounded with trumpets, tinkled with brazen vessels, cast up fand, did all they could to drive them away; but they could not obtain what they defired, wherefore sparing their labour in vain, they died every where of hunger and contagion: as the Mariners and steer-men reported to us, who escaped very hardly from that danger themselves. Eutropin lib. 4. makes mention of very great Locusts, which were seen not far from Rome, to the wonder and amazement of the beholders, the inhabitants were so afraid of them, for their deyouring nature, that they were frighted at their fight. Hence we may collect that those creatures are not the smallest amongst the Armies of the Lord of hosts, when he pleaseth to punish the fins of men, and to revenge himself on the despiters of his Lawes. But as his Justice is admirable, so in his greatest severity Mercy is not wanting; for being that Locusts have brought fundry Nations to want and hunger, and they have had no thing to eat, these Locusts have died suddenly, and became meat for the people they afflicted before: the people of hot Countreys, Their Ufe. (whom especially they spoil of their increase of fruits) as the Ethiopians, Tagetenses, Parthians, Arabians, Lybians, Mellenses, Zemenses, Darienenses, Africans, and those that live about Lepris, the Azanaghi, Senegenses, people of Mauritania, and others, live chiefly upon Locusts, and account their eggs to be dainties; others prepare them thus: First in a low large place they make agreat smoak, by which the Locusts in flying are hindred and forced to fall; than when they have taken them they dry them with falt, the Sun and smoke, and cutting them in pieces, they keep them for their yearly provision, as we do fish, not only those which have large legs, but the Anelabi, the Afelli, Afraci, and almost all kindes of Locusts, as we collect out of Dioscorides, Strabo, Pliny, Solinus, Agatharsis, Plutarch, Avicenna, Posidonins, Leo and Dionysius Africanus, Elian, Diodorus Siculus, Aloysius, Cadmustus, Agricola, and the Centuries of Navigations, whence they were called anestorator, Locust-eaters. Yet though they accounted them amongst their choicest meats, yet the Grecians esteemed them but for meaner fare; if we believe Aristophanes and Plutarch in Sympos. where he cals them the Sustainer of the Countreymans table: S. Matthew in the 3. chapter, faith that John the Baptiff lived upon them and wilde honey; and God appointed four Levit, 11. forts of them to be clean, and suffered the people of Ifrael to feed upon them: whosoever defreth more concerning Locusts for food, let them read the most learned Annotations of Venerable Bede upon St. Matthew. They have no venome in them; yet they that feed on them are not long lived, and seldome live to 40 years, and frequently die young, as Diodorns Siculus, Aga-tharfis, and Strabo have observed. St. Ambrose saich that Locusts hurt neither men nor fruits by themselves, but nourish them; and seed not on fruits unless God command them. But when God gives the word, they kill men, spoil the ground, and execute the vengeance of God. Mantuas Ifaid, shewes travellers their right way; Ophiomachus kils Serpents, all Locusts foreshew the Spring, and what is more acceptable to us? and if by so great multitudes they foretell of famine, by that they sweetly invite us to prayers and repentance; they live so lovingly together, that they fland in need of neither King nor Emperor; for they fly together as Solomon faith, Prov. 30. without a King and live in concord, whence is that faying of Ecclesiastes, Thy keepers are as Locusts, and thy children as the young Locusts: that is, not only numerous, but unanimous, and conspiring together.

What concerns their use in Physick, the Locusts are serving to that end also: for their smell Their use in the Strangury, especially of women. Dioscorid. Bread eat with the flesh of Locusts, is good Physick. for those who are troubled with the Stone : fryed Locusts take away the roughness of the mails : Locust legs bruised with Goats tallow, cure the Leprose. Pliny. Mantes cure hard scrosulous trees

Pppp 2

Book L

Acili dried and drank with wine are excellent good against the stinging of the Scorpion. Attelabi, cure the stinging of Becs, Wasps, Hornets, and hurts by Bloud-suckers, Dioscorid, Eudor. and Pliny 29.4. Arnolau prescribes this composition for the white skins of the eye for dimness, and a cloud, Breviaris lib. 1. c. 16. Let the Locusts be not altogether green, nor wholly black thruft a string through them and strangle them in a little White-wine, then dry them in the shade, then thruje a string enrough enem and stranger sum on the stake Primroso roots, and Fennel roots, dry and powder them, and mingle them with the powder of the Locusts, then keep the powders bound in a cloth, in the said White-mine in a brazen vessell; of which Evine (the cloth being first gently crushed) drop two or three drops into the eyes: As for their quality and temperament; unfalted they heat a little, they inflate, increase seed, ftir up venery, when they and temperations; minutes of worse juice, they cause thirst and burn the bloud; yet they hurt not dropsie persons, nor such as are leucophlegmatical. Silvation. Farther, to touch upon not dropie perions, nor fucil as are leucophingmatical. Another wife of them; Locusts, their feet and wings taken away, are good to feed young Peacocks.

Columnella. Frogs about lakes, and many fish feed on Locusts, which is so well known, that Bellowith withessen. Also the Saleucians have a bird feeds on Locults, as Heszehins temenbers. Jackdawes do also devourthem; wherefore at the publick chargethey are maintained in Thessalia, Illyrium, and Lemnos: for they not only destroy Locusts coming, but they also devour their issue, whereby com is preserved unhurt. Also they are food for Rooks, Choughs, Hens. Geefe, Ducks, for Hogs also and sheep, as besides histories, and long experience, Plutarch wirnesfeth in his book of Iss and Ofiris. Lastly, if any credit may be given to Apomasaris, a man most learned in the learning of the Indians, Persians, and Egyptians, to dream of the coming of Locusts is 2 fign of an Army coming against us, and so much as they shall seem to hurt or not hurt us, so thall the enemy.

The Theater of Inlects: or,

Now it will be time to shew by what means the over great abundance of them may be driven be killed and away by the providence and wisdom of man, and so I shall conclude this Chapter. Pliny saith. driven away. that in the Countrey of Cyrene, it was ordered by a Law, that thrice in the year they should war against the Locusts. First, breaking their eggs, then destroying their young ones, then by killing the grown Locusts. If any failed of this duty they were punished for their default. The Magness and Ephessans march out in military order against them. It is no wonder that divers Nations took counsel how to destroy so cruel an Army, whereas in divers places of Africa and Manritaria, they are so numerous and mischievous, that they force the inhabitants to seek out new habitations, We observed out of Pliny, Valeriola and Pencerns, divers waies to break and destroy their eggs. At the entring of the Spring, rivers are turned upon the places where their eggs are, fo that they abundantly wer all the furface of the earth, or the greatest part of it. If the place be so scituated that they cannot do this, multitudes of men trample over the ground, so that no place is lest, that is either higher or deeper than the rest; if they cannot prevail with their feet, they use a drag, a harrow, and a rowle that are very heavy, such as Countreymen use, that they may the more easily bruise them, and level the ground the better. Also abundance of military Chariots would do no hurt here, for by frequent and often running up and down with the wheels, they would break the eggs: I should also commend the use of the plough, which would dig and turn up the earth, and cut the nests of the Locusts. Some counsel to fright the old Locusts with ringing Bels, sounding Trumpers, beating Drums, and by discharging great Guns, to make that cerrible Salmonean noise, that may drive them away; some think that by great cries and showings of men, they may be terrified, as if the beating of the air might shake them, or as though they heard any of those terrible noises, as some absurdly dream. Others make deep ditches in the fields, and with crackers that beat the air, drive the fearful Locusts thither by degrees, and when they are come into these dirches, they are suddenly overwhelmed with earth, or calting in rubbish, they cover and destroy them. Some affirm that they are taken with pickle made with Locusts, that by it they fall suddenly into a deep sleep, and afterwards dye. By these acts, faith Valeriolasthe Loculis that vexed the people about Arls were destroyed in twenty daies time. In Syria they fight against them in a fouldierly posture. In the Island Lemnos, all Souldiers are bound to bring a cer-tain measure of Locusts to the Magistrates every day. Some Nations, as I said, feed Jackdawes at the publick cost, that as occasion is they may destroy the Locusts. Moreover the birds, namely Storks, are called Selencides, which the inhabitants of the Mount Cassian formerly obrain'd to be sent by Pupieer against the Locusts that destroy'd their corn. These birds come yearly to help them, but whither they fly back, or whence they come, no man can tell. So foon as the Locusts are destroyed they for sake the Mountain, and go home again. Our new Authors mightily commend the smell of brimstone, and of gun-powder, and think they will kill Locusts by their smell; but if a cloud of Locusts or swarm come tumbling into a land, let all the inhabitants lie close in their houses, for if they see no man in their journey, they will readily pass over that countrey, or else they will easily remain in that place. But if they be come before it be observed, they will touch no herb nor corn, nor any thing that is sprinkled with the decocion of bitter Lupines, and wilde Cucumers, for they perish so soon as they touch them. It may be the decoction of the leffer Centory, Wormwood or Walnut leaves would do the same. Afso they are said to passe from those places where bats are hanged alost on the trees. Moreover, if you burn Locusts taken in pits, the same way as I said, that sume will either choak the rest that are near, or will make themfall down, that they may be easily taken with your hands, or they will dye of themselves, being afterwards weakned with the Sun. If you would defend vines

from them, fow three grains of muftard-feed near the root, for they sprouting up afterwards, will by their sharp sent, kill all Bruchi and Locusts what soever that come near them; as the Geoponiche of Cassius and Dionysius Uticensis (not rightly ascribed to Constantine the Emperor) do perswade us. Aristot. 4. hist. 8. saith that Locusts are driven away with the sume of Brimstone, Harts-horn, or Storax. Palladins from the rules of Democritus, lib. 1. tit. 35. Writes that Locults will hurt neither cornnor trees, it many river or sea Crabs be put in an earthen vessel with water, and be covered and fet in the Sun, that they may, evaporate to for ten daies, then whatfoever you would have take no harm, sprinkle with that water every eight daies, till the corn be perfectly grown. Arnoldus faith that Locusts are driven away with the fume of Oxe or Cow-dung, or the timoke of the left horn: but why doth he superstitiously exclude the right horn? for reason and nature hold right to be better than left. The Magicians trust much to their trifling charms, whom fich Plimy hath lib. 37. cap. 9. charged with extreme madness, and vanity unspeakable, I shall say nothing to detain you with. Pencerus, lib. de Divinat, gener. Writes, that the Romans when they knew not the true God, whenkeever they faw fwarms of Locults, used fasting, forrow, facrifices, and all means to pacifie the angry gods, and afterwards they more carefully adored funier, who drove them away. Endown faith, that the oriental Galatians, upon such a tempels, come to the god of Birds, and defirehim often to drive away the Locults that Avaim in their lands. This should admonish us Christians that are entred into the tites of the true God, and are instructed by the perfect light, that the fure way to drive from us hurtful Locusts is to call upon God by prayer joyned with true repentance and unfoigned piety, without which all our force and inventions will come to nought, nor will all our devices avail at all. For I highly approve of that faying For all remedies without Gods affiftance are idlo enterprises of men, but when God is pleased, and biesselb the means, then are they remedies indeed.

CHAP. XVII.

Of Grashoppers and Krickets.

OF all the Infects making a stridulous noise, the Grashopper challengeth the chief place, and by great right too. For in the heat of the day he sends forth a most shrill and musicall found, sustaining his life with dew without doing any harm to herb or trees. Amongst the Greeks he hath divers names, according to the diversity of Countreys, generally and by a common name he is called Tents, by the Eleans, Beleanes by the Sideri, (mas; by the Cretians, (as Bollonius faith) of 400 Jers by the Countreymen of Suidas, iron, because it lives by sucking out of the dew. They attribute also divers names and appallations unto it from its fex, age, bigness, and singing. For the female which doth not fing at all Aplian cals usuam; Stephanns, usuaumia, that fings not; Euffarbius thinks it is not a Grashopper, but another kinde of creature like it. So doth Athenans 1.4, from Spensippus, if unercom two busine titles is reugaria, like to a Grashopper, or the Bird called a small Turtle. Indeed the words of Lia out of Alexis cited by Atheneus in his Thraso, give in 4 large testimony to the same, both that the Corcopa had a voice, and was of a divers kinde from the Gicada or Grashopper (I never saw the semale Cercopes nor the Pye, nor the Nightingale, nor the Grashoppers male) unless perhaps the Grecians were wont to keep together in their caves the male and female Tuttle, so we should say they joyned together in like manner, the male Graff hopper and the female Cercopa; for that they did not only keep them together with the Pve and the Philomele, for their finging sake, but that they might behold their mutual embraces dalliance and luttil pleasure. Add to this that Athenaus calleth it handsness, or the more talkative; fofar is he from accributing all the business of finging and making a noise to her male, contrary to the custome of the female.

The Grashopper when it comes to be old is called will, when young and tender nixms & nixos, 15 Hefychius observeth. The little Citashoppers (which Gaza calleth Cicadastras, and we Cicadas las) the Greeks call waterishes & wayshous which fignification I wonder that it is passed over by Stephanus. The word τολαμαίνει put substantively, signifies the least Grashopper of all, as Enfathing witnesses. Τεπικόνια also do signifie the lesser Grashoppers, as we read in Calins, although Enstathing will have them to be creatures of another species, like to Grashoppers, as otherwhere he cale them the females of Grashoppers. These Dinnssius will have so called of the Greek word willies, from the found they make. The more vocal and observer of them called Emeladisare the Acherai, or the Males, making indeed a very pleasant and mulical noise. The other being mure and more wilde are called Sigalphi, from their filence, as also Acanthii. In Arabick, Giwolo and Cicuale, Yulderetriche and Robiche. Silvat. Cicara is a barbarous word of a Latine or Spinish word corrupted. In Italian Ligallo, Cicara, and otherwhere Lazenzala; In Spanish Cig-Matrigas, and Ciganre; in Germany and England I do not hear that there are any Grashoppers to be found, but if they be, they are in both Countreys called Bow krickels, or Bankm Krickets; in Flanders, Feildedrofin; of the Walloons, (if I miliake not) Straffen; in Polonia, Konick, Zyemujco, Spiema. Sometimes the name: Krickets and Grashoppers, are promisenously used, which cannot be, unless you will say that the Kricket is a Grashopper without wings. The Latines as

Pppp 3

fome that hunt after words will have it derive the word Gicada, quasi cito cadens, (i. e.) quickly perishing. And that indeed is the Epithet that Arist. gives it, and were rishes, the short lived Grashopper, for so indeed it seems to be.

Of the Grashoppers, some are more common, others more rare. The common and ordinary so that the head big, and bending downward; and is of the figure of a Pentagon, terminated with unequal sides; it is of a blackish green colour, having on each side two bunches or bosses of the same colour, but of an ovall figure, and edged about with a dark coloured margine, and a line of streak of the same running along cuts the bosses in the mids, but the letter larm of a pure black colour

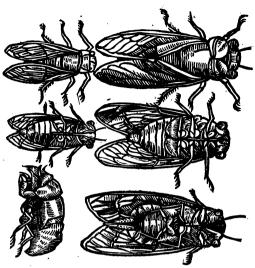

pones in the head right in the middle; it hath eyes of fomewhat a dark green, prominent and big, confidering the bulk of the body; informach that I wonder that Nigidius (that denies that they have any eyes) could not fee them. But indeed as Ariffetle faith they are very dull fighted. For if you bend your finger and put it back toward their eyes, they will rather come towards you than go from you, and will the sooner get upon your hand being drawn thereto by the shadow of the finger: the head or rather the face looking upward, appears of a weak green from white.

The Grashopper amongst the Insects, is the only one of those kinde of creatures that is without a mouth, but hath it otherwise supplyed, by a long kinde of compact sast substance, which like a promusics supplies the place of a mouth and tongue sashioned round and hollow like a pipe or gutter, reserved for the most part within, having ten streaks running athwart it, with the which it sucks the dew, the only nutriment that it hath, and which is peculiar unto it, as Virgil saith, Pascuntur dum rore Cicada: Whence it is in Athenaus that the question is controverted, afterward concluded, that water alone is able to maintain life, because with it alone the Grashoppers are sustained. Hence it is that elsewhere herepears the saying of a certain Parasite to this purpose we shall rishly say say, i.e. I am not such a one as

liveth on dew nor heibs. And that of Theocritus is very like it: Doth he live on dew like a Grafhopper? Away then with that Fable of Afop which is commonly received, that the Grafhoppers begged food from the Ants, for we may learn out of Plato, that the Grafhoppers are confectated to Apollo, and the Mules bestowed on them this boon, that they should live only by singing, not so much as mentioning the dew. We shall also pass over those inventions of Trease as not worth the mentioning, who reports that the Grashoppers are alwaies provided with sood in great variety. It is reported by Antonius Altomarinus in his Book de Manna, that the Grashoppers do suck the juice out of the bark and leaves of the Ash-tree, or Elm chiefly, the which we call Manna, but yet it is more likely that they suck it off from herbs, or out of them, as the Butterssies do, both because they are alwaies sound to be empty within, and for that they are not perceived to void any thing, unless it be when they have taken in a little more dew then ordinary, they cast out of their bodies the superfluicy thereof, as the Countreymen have observed.

The body is fastned to the head by a very short neck, or rather none at all indeed, the shoulders are spotted with green and black, the breast is of a bright green well towards white, out of which come three feet and shanks on each fide of a leek colour; the belly in the bigger fort is two fingers in length, and one in breadth; the inner part of the belly refembles a target ending in a sharp point, and is compassed about with an hem having twelve or thirteen joynts in it; within appear certain incifures of the same colour with the belly; the males (that is, the least of the two) have the end of their tail forked; the females on the other fide whole; their back is blackish with seven or eight green lines or incidures drawn athwart the same; the wings very curious, of a filver colour, and painted with dusky spots and specks very trim, the outermost twice as long as the innermost, and more various: the dark brown is more rarely seen, which Ludoviens Armacus a very diligent Chirurgeon, brought from Guinea, and gave to Pennius: also Mr. White a rare Paintet, gave him another brought forthfrom Virginie, it was all of an ash-colour, (it may be it was that the Greeks call room) but it was like the former in proportion, it hath both its wings filver coloured, but not at all, spotted, and the former green ones were. Those that live in quicksets are most green and big, those that are found in oats, or com, or graffe, are of divers colours according to the place where they be, and are far lefte then the rest.

But if we compare their Nature and conditions with mans, they being our fervants, do excell their Lords and Masters in virtue; and may teach us manners. For they shew forth that harmsesses of conversation, that they will not hurt or abuse any creature; but we perverting the

right use of things, can finde in our hearts many times to abuse even our parents themselves. What guel will be content with the diet of the Grafhopper; that is simple, mean and frugall, not inquinated with variety of dishes, or cookery, or curious mixtures? yea fo far hath foolish curiosity prevailed with men, that unless flesh of contrary nature, and with them fruits, leaves, ipices, liquors, be dressed together, they think their appetite unfatisfied, & their palat very much wronged, nauseating that clean and whol-some diet of their forefathers. Those can quench their thirst with a little dew: we with our diversity of mixtures do rather invite and increase thirst than allay it. They living in shrubs near to the earth(in which they had rather fing) yet notwithstanding lead a cheerfull life, and with their high stained notes, do make the lowness of their condition more easie to them. But we men if cast from any high place, we presently despair, and are afraid at every turn of the wheel of Fortune.

The Grashoppers hold on singing from morning to night, without intermission, very pleasant and sweetly; whereas many Preachers neither preach well nor often, scarce four times throughout the year: truly they may be assamed being bred more civilly, to be admonithed of their duty by a wilde nufician. These if you scratch or tickle their belly (as Poets which were commended) fing more shrill; but those speak them as fair as posfible may be, yea invite them with gifts, yet (like the Argonanta of Martial) neither use the care, nor lift up their eyes or hands to the fayles. Moreover these agree all together in one time, and bestow their mutual help in their affairs. But I would to God these did not wholly buse themselves in sowing strife, and breeding controversies, that they did not wrangle together about wool and flax, figures and forms, and ceremonies, and of things decent, undecently and unfeemly. True is the proverb of Theocritus concerning them, नांनीई नांनीन। श्रीकि, the Grashoppers are a friend each to other; but man who ought to be a God to man, rather proves a wolf and a Devil, and putting off the nature of a man, tears up his own bowels.

Amongst the Grashoppers the females are silent; the males do in a manner loath venery, neither are drawn unto it but by many enticements of the semale. But our women have more tongue by far than men; and the men behave themselves more lasciviously than women. What is to be

added further. The Grashoppers of all other Insects seem to be without passion, but the perturbations of our mindes do carry us on so headlong, that upon every slight cause, yea none at all, we wax hot with anger, pine away with grief, burn with envy and jealousse.

Now for the musick which the Grashoppers make, amongst all the Insects there is none like isaccounted so sweet amongst the Ancients, that they equalled it to the sound of the Harp, as Polling writeth, and it may be Lucretius therefore called Grashoppers Teretes. When Timon Sillographus would commend the eloquence of Plato, he compared it to the musick of the Grashoppers: his words are these: Plato sings sweetly, and as well as the Grashoppers. They begin to sing in the heat of the day, even at what time the reapers would otherwise leave work, who efore those laborious chanters get them up into trees, and there fill the ears of the labourers and passenges with their melodious noise. For as musick is a kinde refreshment and recreation to the fainting spirits and tired brain, so the unaffected notes and layer of the Grashoppers, and the earnelmess of their contention in singing, doth serve as a spur to provoke men to endure

labour, and doth not only invite the reapers to gather the fruits, but detains then in their work.

The Theater of Infects: or,

Of the strife between Euromus of Locris, and Aristo of Rhegium two Harpers, and Euromus getting the better, by reason of a Grashopper flying to his harp and sixting upon it and supplying the place of his broken string: read Antigonus Mirabilium narrat. l. 1. & Strabo Geograph. 1. 6. Of which contention also Solinus makes mention: and indeed the Ancients by the Grafhopper understand Musick, and therefore they painted the Grashopper sitting upon Euromus Harp, as the known Hieroglyphick of the Muses, as Strabo, Phlegeton, and Pansanias give us to un-

With the Athenians it was the symbole of Antiquity and Nobility, and to that end (as now the Spaniard doth the golden Fleece) fo they wear golden Grashoppers embroydered on their Hair, from whence they were called will police. The Author of the Anthologies faith further in his third Book, that the Ancients had the Grashopper in such veneration, that they made a monument for it in the Promontory of Tanarus in the Countrey of Laconia, and engraved a very elegant Elogy thereupon in its praise; to which Orus Apollo, Hieroglyph. 2. doth subscribe. In a word, there is none to whom the mulick of the Grashopper can seem harsh or unpleasant, but is either not well at ease in his minde or his body, and so can be no competent judge of musical ftrains. The Grecians had them in such estimation, that they kept them in Cages to please their ears with them.

Now to adde something concerning the manner how they make this noise, and then to proceed to their original and death. This stridulous and obstreperous noise they make, some think

to be caused one way and some another.

Pierins thinks it is formed in the fnout or promuscis: Proclus Diadichus, by the rubbing together of their wings, हे न्द्रीहि बंदीक देवारे नवाँद्र मीहिएएँड न्द्राहिका हेकावित हो निक्ष करनाध्यमक, that is to fay, The Grashopper sings by frequent clapping of its mings together, and so it makes a noise. And the same thinks Hesiod. But that they sing not with their mouth all men know, as neither by the rubbing of their wings together as the Locust doth, but by the reverberation of a little membrane under the flabells; (so they call those two coverings behinde the hinder thighs cleaving to the belly) or as Aristotle describes it in brief. They make this noise by reason of the air striking against the membrane under the midriffe; for by that means it being diffended or remitted, and forced up and down, there breaketh forth a stridulous found, such as the boyes make with their reed or oaten pipes, which have a thin skin, which being prefled down, shaken or intended, it must make a found. And this is the reason why the female Grashoppers sing not at all, because they want that space between the thighs, where this thin membrane growes in the males and causeth this found. Others make the females to be more cold by far than the males, and that they make the cause of their silence. But forasmuch as Eunuchs, old men, and old women, make most moise and greater than young persons that are more hot, therefore frigidity cannot be the cause. Add further (if we will stand to the judgement of Hippocrates) that women are more or than men; but if they be not so, yet it must needs be acknowledged, that the female Grahoppers are more hot than the male, because under the midrifte they are not so divided but the males in that place (were it not forthat little membrane to hinder) they mighe easily be blown through. Nature certainly intended by denying a voice to the females of these Grashoppers to teach our women that lefton; save preate nation in oryn girl, what ornament filence brings to the female fex.

They begin first of all to fing about the latter end of the Spring, the Sun being good the Meridian, and perchance in hotter Countreys sooner, where quicklets of the lets are the first are there they live more happily, and fing more willingly. For they are of all treature the left melancholy, and for that reason they do affect not only green and pleasance the left melancholy and for that reason they do affect not only green and pleasance the left melancholy. Yea they are not to be found in those places where there are too many and too shady. Hence it comes to passes have been all they are there is there are too many and too shady. Hence it comes to passes have been all they are there is there are too many and too shady. in none of the fields there is there any Grashoppers to be found, whereas hear the Town they are frequently heard. They shun also cold places, indeed they cannot live in them. They love the Olive tree, because of the thinness of the bough and narrowness of the leaves whereby they

They never after their place, as neither doth the Stork, or at least very seldome; or if they do they are ever after filent, they fing no more; so much doth the love of their native soyl pre-

vail with them.

In the Countrey of Miletus (faith Pliny) they are seldome seen. In the Island Cephalenia there runs a River, on the one side whereof there is plenty of them, on the other in a manner none: that which I should take to be the cause, is either the want of trees, or the too much abundance, or else a certain natural antipathy of the soyl; as Ireland neither brings forth nor breeds any venomous creature: for the same reasons they do not fancy the Kingdome of Naples; although Navier of Naples; though Niphus relates that to be done by the enchantment of one Maro. Times that witteh the History of Sicily, reports that in the Countrey of Locris on the hither fide of the River He lies they are marvellous loud; on the other fide toward the city of Rhegium, there is featce one to be heard: they are not therefore silent because Hercules prayed against them for disturbing him of his sleep, as Solinus fabulously relates, but because they are more merry and jocond at home;

Of lesser living Creatures. CHAP. 17.

as the Cock is: whence it is that the Lorian Grashoppers will not sing at Rheeium, nor theirs on the contrary near Locris; and yet there is but a small river runs between them, such a one as one may calt a stone over. Much certainly doth their Countrey (which comprehends in it all the love that may be) move them: where like the people of the Jewes, they refuse to ting their native Songs in a strange Countrey; who being cast out of their own habitation, seek means to die rather than waies to live; so prodigal seem they of their short life, and detirous after their native dwelling.

They do so affect the company of men, that unless they see fields full of Mowers or harvest folk, and the waies with passengers, they ling very low and seldome, or silently and to themfelves. But if once they hear the reapers making merry, talking and finging, (which is commonly at noon) then they fing fo loud as if they strove who should ling loudest, together with them. Wherefore not undefervedly was the Pataine in Athenans called visit, who being naturally obstemious by nature, yet was so full of talk, as if he strove that no body should be heard at the tablebut he. Socrates in his Phadro recites the Hillory of the Grashoppers very wittily, warning men not to fleep in the heat of the day, left the Grainoppers mock them; for the Poets report how their diligence was highly rewarded. For they fay that the Grashoppers before the Muses were, were men; who afterwards when the Muses came taught them to sing; but some of them were so delighted with musick and singing, that altogether neglecting their meat and drink in-considerately, they perished; the which afterwards being turned into Grashoppers, the Muses gave them that for a reward, that they should be able to live even in the heat of the day without meat or drink, neither to have any need of bloud or moisture.

They couple and generate with creatures of the same kinde, as Ariffetle tels us, and the male Their Copycalts his feed into the female, which she accordingly receives; they bring forth in fallow grounds, lation and hollowing it with that sharp picked hollow part of their tail, as the Bruchus doth, and therefore Generation. there is great plenty of Grashoppers in the Countrey of Cyrene. Also in reeds, wherewith the vines are propped, they make hollow a place for their neil; and sometimes they breed in the

stalk of the herb Squilla, but this broad soon fals to the ground.

This is also worth the notice, which Hugo Solerius writing upon Actius affirmeth, that the Grashoppers dye with bringing forth, the ventricle of the semale being rent asunder in the birth (the which some being very much deceived therein, do report of the Viper) the which I exceedingly marvel at. For they lay white eggs, and do not bring forth a living creature (as the field mouse doth) unless it be by reason of Weakness: of the egge comes a little worm, of that comes a creature like to the Aurelia of the Butterfly, which is called Testigometra, (at what time they are very delicate meat to be eaten before the shell be broken) afterwards about the Solflices, in the night come forth of that matrix, the Grashoppers; all black, hard, and somewhat big. When they are thus got out, those that are for the quicklets, betake themselves thither; those that live amongst the corn, go and fit upon that, at their departue they leave behinde them a little kinde of moisture; not long after they are able to take wing, and they begin to fing. That therefore which Solerius feigneth concerning the burfling of the womb of the mother, I should conceive to be understood of the matrixes.

Acertain woman did bring up some young Grashoppers, for her delight sake and to hear them sing; which became with young without the help of the male, if we may believe Arist. 1. 1. de hist. anim. but since he hathrold us that all the semales of Grashoppers are mute by nature, and this spontaneous impregnation is far from truth, either the woman deceived Aristotle, or

There is another kinde of Generation of Grashoppers, that we read of. For if clay be not dug up in due time, it will breed Grashoppers, so saith Paracelsus, and before him Hesschius. For this cause Plate saith Grashoppers were of old time men born of the earth, but by the favour of the Muses curned into that Musical fort of creatures, the Grashoppers. Even at this day sustaining their lives with no other food than dew, and feeding themselves by continual finging they live. For this cause the Athenians were called Tetrigophori, because they wore golden Grashoppers for ornament in their hair, and for a token of their nobility and antiquity; as Thucidides 1. Syngraph, and Heraslides Ponticus de priscie Atheniensibus testifie. Erytheus makes a proof of this custome, being born of the earth as they iay, who first governed the Common-wealth of the Athenians and they too in the judgement of Plato, the Natives were dilloxomes, i.e. born of the earth. Afterwards it came to be a custome that none but an Athenian, or one born in the place might wear a Grashopper in his hair: of this opinion is Aristoph. as also his Scholiast.

Isabre faith that the Cuckow-spirtle dorn generate Grashoppers, which is not true, but that it produceth small Locusts is manifest. Lucretius in his 4, Book, saith that the Grashopper in

the Summer doth shift his skin, according to this verse:

Cum veteres ponunt tunicas aftate Cicada;

And for that reason he is called by Hespohius, pursions rising, i. e. the naked Grassoppers or without a skin: whom I should not have believed unless I had the picture of the skin so cast off

Before Copulation the Males are of the more delicate tafte, afterwards the females, for that

they have in them white eggs very pleasant to the palat. The Parthians, as Pliny writethand the relt of the eastern Nations feed upon them; not only for nutrition fake, but to open their veins. and to flir up their languishing appetite, as Atheneus in his 4. Book, and Natalis Comes expressly arand to thir up their languinning appetites, and to their appetites, writes that the gods did feed upon Grashoppers, at what time they had lost their appetite through choler or pation. Thave seen, Grainoppers, at what time they had fold them tyed in bundles together for men to eat, to wit, the most voracious of all living creatures did fell the most jejune, lest any thing should be lacking to their exquisite dainties.

Their ufe in

Dioscorides gave rosted Grashoppers to eat, and saith they are very good against the diseases of the bladder. Some, faith Galen, use dryed Grashoppers for the Colick; they give accorof the pladder. Some, factor of grains of Pepper, as well when it goes off as when it comes on Trallianus bids to give them for the Stone, dried and beaten, the wings and feet first of all taken away, and this to be done in a bath with fiveet Wine and Hippocrass. Agineta useth them dryed for the Stone in the reins, and for the diseases of the reins he invented the composition called Distertigon. Such another like Antidote doth Myrepfus prescribe, but all heads and feet as supervacaneous members being cast away. Luminaris that transcribed an Electuary out of Nicopervacaneous memors being sate with their heads and legs cast aways, two ounces, Grommel feed, Saxifrage feed, each 1 ounce : Pepper, Galanga, Cinnamon, of each 2 drams, Lienum Aloes, half a dram; honey what is sufficient. Nicolaus useth Grashoppers burned and powdered, mingled with honey, and gives them about the bigness of a bean in a quantity of wine. Actius gives three Grashoppers beat in Wine. Some in Itead of Cantharides use Grashoppers to provoke usine, and in my judgement not without very good reason; for they are taken with lesse danger. and do work sooner, as well in this disease, as in the weakness of venery. Nones the Physician prescribes an Antidote of Grashoppers, and Xenopbyllum, against the Stone in the kidneys. retaus for the remedies of the bladder, speaks thus of Grashoppers; The best remedy for the bladder, is a Grashopper given in its time to eat (Males before copulation, but afterwards Females, as we finde in Aristotle) but out of their time, dried and pondered; boyl them with water and a little spike : also let the patient sit in the same for a bath to ease the pains of the bladder. Some of our later practitioners, put Grashoppers in oyl, and set them in the Sun, and mingle them with oyl of Scorpions, and anoint the privities of men and women, the testicles and parts about with it for pains of the bladder. Arnoldus, Breviar. l. 1. c. 20. & 32. commends the powder of Grafhoppers for the Colick, and Iliack passion, and also to drive forth the Stone; if half a Grashopper in powder be drank with Goats bloud, or Diuretick wine. Lauframus highly esteems the ashes of Grashoppers to break the Stone, taken with Radish water, or the decoction of chich Peafe. Also they cause idle and lazy boyes to hunt after them: Theoriens speaks thus of it in his first Idyllium.

Hee with thin ears of corn bound to a cane did make A whip, for Grashoppers to hunt and take.

Neither are they only excellent meat, and very usefull in Phylick to men, but they feed Birds also, and insnare them. For the youth of Crete (as Bellonius witnesseth) hide a hook in the body of a Grashopper, and when they have fallned it to a line, they cast it up into the air; which the Merops seeing, catch it and swalloweth; which when the boyes perceive they draw it to them; and

so do exercise their air-sowling not without profit and pleasure.

The Grashoppers abounding in the end of the Spring, do foretel a fickly year to come, not that they are the cause of putrefaction in themselves, but only shew plenty of putrid matter to be, when there is such store of them appear. Oftentines their coming and singing doth pottend the happy state of things: so Theoritus, it thinks and makerus. Niphus said that what year but few of them are to be seen, they presage dearness of victuals, and scarcity of all things essentially But whereas To. Langins (a Philosopher of great reading and learning, and a famous Physician) faith lib. 2. epiff. that Grashoppers did eat the corn in Germany as the Locusts do; Semmius, that it was done in Helvetia: Lycosthenes lib. prodig. and the Greek Epigram doth affirm, that they eat the fruits and crop the herbs, truly (unless they mean a Locust in stead of a Grashopper) they declare a strange thing, and saving the credit of so samous men) I will not believe, for they have neither teeth nor excrement as hath been said, but only feed and swell with the dew. Besides, although I have gone over all Helvetia, Germany and England, and have fearcht for a Grashopper as for a needle, yet could I finde none. And therefore I suppose that both they themselves, as also Guill. de Conchy, and Albert. Vincentius, to have miltaken the Locust or Bruchus for the Grafhopper, being deceived by the common error, who take the one for the other. They that defire more of their nature and use, may consult the Authors of the Greek and Latine Epigrams, with praising them or dispraising them according to their own humour.

The Egyptians by a Grashopper painted, understood a Priest and an holy man; the later makers of Hieroglyphicks, sometimes will have them to signific Musicians, sometimes praclers or talkative companions, but very fondly. How ever the matter be, the Grashopper hath

Sec. 35. 35. 1. 1. 2. 1. 2. 1.

fung very well of her self in my judgement in this following Distich:

Sim licet infecti genus exigume atq; minutum Magna tamen parvis gratia rebus ineft.

Although I am an Infect very small, "Yer with great vertue am endow'd withall. Section of the state of

Next in order followeth the Gryllus of Kricket, both for that it resembleth is somewhat in The name of hape, the wings excepted, but comes very near it in its note and manner of anging. Cale the Kricket, sine faith it is called in Greek stimes, but citech nor his author, neither can he. Ochers from the simplified the contest of the called like the noise of the dashing of waves, which is called Gradliffinis, in the number of whom is Isladore. Fluidiann funits called it from the hardness of
the found dashi one not rightly; whereas I have proved one of Arise, that to be a greater for of Locales. Freights quest lib. from Pliny, callern in Tryxalia's the which norwichlanding it be an Infect without wings as the other is, yet it is not at all like to the Gryddin in form or shape. the is called also in Latine Gryflin; in French, un Gryflen, Crysien; in Arabick, Sanfir, if we may believe Bellunensti; in Barbary, Girad; of Avicen, Algiedrigh; of the Polonians, Swiere; Hungarians, Ofsisereg; in Germany, in Grid, ein Horme; about Argentinum (from the moneth wherein it fings) Brach vogle; of the IH ytians, Smierta, Camrazick; of the Italian and Spaniard, Gallo; of the English, a Krickes; of the Dutch Crokes, Nachtecreket.

The Grylins or Kricker is of two forts, the field Kricket, and the house Kricker Phin refers them both to the kindes of black Beetles, but improperly, fince they have not their wings in a cover, but only thin membranes, though the outmost are far thicker than those that hid under them. Calepines that came after him, makes it a kinde of Locusts but his error is the

fame. Niphus on Ariforde, hift. 5. 28. 6 29. cals them ground Locusts and Bruches, as also altered by ignorance cals them frampopers. Of the field Krickers, some are males from are from the body forms had longer, of a blackish copies, but the body somewhat longer, of a blackish copies, the head for the bulk of the body, big; the eyes treat, standing out, the fore-head homed, but the homes with out joynts, which notwithstanding are moved to and fto with eafe. " It hath fix feet coloured like the body, the hindermost longer than the rest, for the more nimbleness of motion and leaping; they go (as all the rest of the Krickets do) forward and backward; the wings as it were slightly engraven, and crooked, covering almost all the body, the tail forked, the body less than that of the female; she having a bigger belly, is of an unfightly green colour; the eyes grafs-colour, the cornicles reddiff, the tail three torked like a Trident, in bulk of body differing from the male. In the Summer they are found in the fields, making holes in the catth, and building their netts. In a calm Winterthey lie hid, in a cold and sharp they die in their holes, the which they feem to have digged without the help of a Pioneer.

The noise which they make is caused by the rubbing of their wings one against the other, as Illny witnesseth. Jacob Garret an industrious and ingenious Apothecary did the same with the wings plucks of and rabbed together, very curningly imitating them; infomuch that I wonder at Scaliger, who saith it cometh from a kinde of I know not what follicle and pipe placed in the hollow part of the belly; and at Sabinus who ascribeth it to the collision or grating together of their teeth : the which Pliny also, but fallly, writeth of the Locusts. When as either of them through the narrowness of the passages of their holes do lightly rub their wings, whether field Kricker or domestick, they make but a small sound: but when they are out of doors and rub hard, they make a very shril loud noise, yet not at all without the motion and agitation of their wings : the which if you crop or pull off, you shall see all that noise presently to cease. In the heat of the day (in which they are much delighted) and in the night also they sing before their holes mouth.

Their common abode is in pastures and medows; they do not willingly earry in shady and opacous places, they feldome live till winter as George Agricola Writeth.

Nigidins gives great credit to them, but the Magicians more; because they go backward and make a notife in the night, and make holes in the earth. The farther off they are, they make the shriller noise; whereas being near at hand they are silent, and through sear or sulpicion presently betake themselves to their holes. The Kricket, (faith Albertus 1. 4. c. 7. exercit. 273.) if it be divided in the middle, or have the head taken off, yet sings and lives a great while after. The which if it be true, what shall become of that pipe in the belly of them which Scaliger saith doth cause the sound? The children use to hunt them with a Pismire tyed about the middle

CHAP. 18.

with a hair, which they put into their hole, blowing away first of all the dust left she should hide her self again, and so is drawn out by the Pismire. Plin. 1. 29. c. uls. But sooner and with less labour is she taken thus, take a long small twig or a straw, and put it into the holes, and draw it out by little and little, out she comes presently to her holes mouth, as it were to ask what the matter is, or who offered that injury to her hole; and so is taken, from whensey comet the Proverby Stultion Gryllo, more silly than the Knicket; of him that for every light cause doth betray himself to his enemy, and wittingly brings himself into danger. They live upon new Panick, ripe self to his enemy, and wittingly brings himself into danger.

Wheat and Appies.

The house Kricket (if we may believe Albertus) is called of the Greeks weeks, but no such name can be found. It may be he took a barbarous word for a Greek: the English call them house

Krickets, the Germans, Heimgrill.

Pliny 1. 12. el 128. writing of the Scarabee (among which he fallly reckons the Kricket) hath these words: Some of them dig holes in the ground, others of them in the dry earth between the fire and the oven, making a great notic in the night. The Domestick like the former are both male and semale: The male is almost all over of a dunnish colour, the back of a various dun, or rather black; the body long and much less than the field Kricker; the head almost round, the

eyes black, the cornicles movable every way, in form and hape all alike the field Kricket; about the root of the middle feet two frow white lines do crofs the back and adom it.

In the moneths of July and Angult they fly, but not far nor long; and that like the Wood-pecker, or Hickway, with a waying flight, fometimes descending with her wings spread abroad, sometimes descending with her wings elose to her body: the tail is forked. The semale is the bigger and longer bellied, she flyeth with four wings, of which the outermost are shorter, the innermost narrower and longer; the end of the tail hath three prickles or bristles. Both the sexs fly, and leap and run, and that wistly, they lick in greedily the scum of broth, and barm of ale or beer; they feed likewise on the matter and liquor that cometh out of corrupted sless or briskles. Of this Insect writtes Albertus thus. The Gryllus or Kricket which sings in the night, seems to have no mouth as the field Krickets have, but there is found in his

head a long thing like a tongue, and it growes above the outer part of the head, and that part is not cloven, as the mouthes of other creatures; neither is there found in the belly any spersfluity at all, although it feed on the moisture of flesh and sat of broth, to which either powred out or referred it runs in the night; yea although it feed on bread, yet is the belly alwaies lank and void

The Kricket doth not only recreate men weary with labour, with their finging, but are good for physick also to drive away diseases. The Ancients (as Scaliger hath observed Exercit. 186. and found it by his own experience to be true) did use them in stead of the Cantharides, and with the like success. It being dug out of the earth with the earth with its is good for the running of the ears. Being subsed between the hands it cureth the disease called St. Antholius sire, as also the swelling of the jawes: but this Kricket must be digged out together with its earth with non- and afterwards be subbed; and so the patient will not only be cured for the present, but shall be free for a year from having the disease again, Plin. 1, 30, 49, 9, 12. They cure also the Paraida, i.e. an Impostume or fore coming of matter distilled from the head into the kernels of the ears; whether they be bound upon the place, or the place anointed therewith; they serve also, together with their earth, to anoint the Kings-Evill. Their ashes mixt with oyl, bring old users to Cicatrice. The Kricket diluted in water is good against the Stone or difficulty of urine. Belliner is used to drop the oyl of them into the ears of them that are diseased in that part; by that means taking away all the dolour and pulsation of them. Marcellus much commends the stroking of them upon the tumours of the jawes, and binding them upon the same: and in the opinion of them upon the tumours of the jawes, and binding them upon the fame: and in the opinion of the Tonsils in this Distich:

A Kricket with right hand on Tonfils prest, To kill the Kricket, gives the patient rest.

Children (as the Italians do Grashoppers) do keep them in a box bored full of holes, or bags to hear them sing in the night, giving them leaves of herbs whereon to feed, and so keep them all the Summer. They are kept in Africk in iron cages, and are sold at a great rate, as I have heard by some Merchants, to cause sleep. For those of the inhabitants of Fesse are exceedingly delighted with their shrill noise; as much as the Irish and Welch with the sound of the Harp. With which also learned Scaliger seems to be not a little affected, when for their musick sake he kept them inclosed in a box, the which if he had kept in such a thing where they might have had airshe had not found dead after three daies, but able to live a long while: lib. de plant. For being secluded from the air they cannot live, which besides air and sound have nothing in them, nor seem to

to be any thing else. The last Summer I had a male and a female of them; but within eight, daies, I found the sides of the female eaten out by the male, which also it tels two daies after

expired.
The Bird Lanio, as the learned Brewer hath observed, is fed with them. The which she fastens upon thorns near to her nest of young, for fear they should want food.

when they become offensive by reason of their number, thus they may be driven away or taken off. Take a good deep dish filled of water, and place it before their holes mouth with a good deal of oatmeal found about it; so the Krickets leaping up into the boul are drowned; or if you mix water with Vitriol and inject it into their hole, they will be gone.

There is one little winged creature behinde, which whether it may be referred to the Classis of Grashoppers or Locults I know not, For by that it slies in swarms, and eats the corn, it may seem to be a Locult; but in figure and shape it is likest the Grashopper above any thing. The visage of this creature is wonderful resembling an Infants; it hath on the head a three cornered cap, in the top of which are four black foots; two often very long, the other two almost round, bein the top in the top these it may be were those Locusts of which Cuspianus hath written out of Sigeberens, In the moneth of Angust (saith he) in the year 874, a wonderful swarm of Locusts having fix wings, and fix feet, did fly out of the East, by which almost all France was destroyed. You would say at first fight they had a hood upon their shoulders; but if you look nearer hand, it is nothing but the upper part of the wings inclosed with a semicircle. The body very thick, of a black and dun colour, the hinder part of the wings were all full of black spots, P. Quickelbergins of the City of Antwerp, fent over this to Pennius out of Africk, the which I keep to this day in my flores house of Insects, by the name of a young Gralhopper, And as little am I satisfied concerning the Trivalia, (spoken of before) it had its name it may be from gnawing or eating. But that it should be either the Bruchus, or the little Herb-locust, Grashopper, or Kricket, I cannot be induced to believe. Not only because Athenaus, Pliny, and other Philosophers are not agreed in that very point; but besides, because they do much differ in form and nature; and why I pray may not roughly be derived from rough, to make a noise? and if it be, truly it will best agree with the Krickets, which because of the noise it makes, it may be as true of the Cricket, which Peucer very well distinguisheth from the Blatta or Beetle, as by other things, so by the noise it makes: that which foach. Camerarius, son of that great Camerari-

us and heir of his vertues, first observed, Pliny advisets to role 20 of thermand to drink them with sweet wine against shortness of breath, and spitting of bloud. The ashes of them in honey, applyed to the rugged edges of ulcers takes them down; they are likewise exceeding good for the stopping of womens courses or monethly pur-

Hitherto I thought good also to refer the water Grashopper of Ronal doletins, whose head is like a pentangle, having as it were five corners, the eyes round and standing out of the head, not great, but black; the comicles very short, coming forth out of the outermost part of the mouth; on each side it hath three feet, the hindermost longer than the rest; on the back it hath little wings, or some coming; the tail forked, the belly oftentimes as it were clest; the colour of the body somewhat dun, or rather black and white. I found them in muddy and standing waters, but the nature of it I yet know not. This differs from the land Grashopper, both for that the head stands out more, and it seems to have some kinde of neck, and also it hath wings not fit for slight, but only to lift it self up. This Is-said to make a kinde of a pleasant noise like the land Grashopper, upon the

leaves of the water Lilly, pond-weed, and other water herbs. The which I have not as yet heard.

CHAP, XVIII.

Of Moths called Blatta.

Oft men talk much of the Blatta, but few or none able to describe what the Blatta, properly so called, are, neither do they give the least mark whereby they may be known; but gas thering divers notions here and there do put them all together and consound them. And but that Pliny had brought some light to this History, the Blatta had altogether been omitted or lost, First of all therefore we shall shew to what Insects the name of Blatta was given according to Aux thors, then we shall see down what the true Blatta and properly so called is. Now under the name of Blatta are comprehended both the worms growing in the gare, as also those Phalens which

996

which trouble the Hives of Bees. But fince these desire the light, the other altogether shun it. which trouble the Investor Dealers, I do not fee. The Blatta also is a little worm eating cloathes or books. So Horace in his Sermons, Blattarum & tinearum epula &c. But Martial altogether diffinguisheth between the Blatta and the Tinea, and sheweth them to be creatures of several kindes.

veral killies.

It is taken also of the Moderns for the little worm called one, out of whose web silken garments are made. Some call the little worm that groweth in the grain in the low oake, Blatta, from whence cometh the Blattean colour, or grain colour. So Turngb. advers. 1. 18. c. 17. 6. 1. 28. c. 23. The Blattean colour is died with worms which come out of the grain of Cockle, out of whose bloud is produced a most curious colour, not black, as some think, but a bright purple or fcarlet. To which the Book de natura rerum, & Gualter de Conchis do assent. The worms of the belly some call Blatte. Cardanus in one place calleth the worms that breed in meal or bran, Elatta. Gaza interprets the word reedlus, as also sesonnellus, Blatta. But the proper and right name thereof is when; according to Pollux, when; as also according to Lucian, deciding a man name thereof is the state of th trutians Piattela; the Germans, Wibell, Brottmorme, Brottkarfaer, Malkaefaer, Springnibell; they of Norimberg call one species of them by way of sport, Schavahen, because it cannot endure cold, as Cordus writeth; the Illyrians, Sninie; the Polonians, Molulowy; the Hungarians, Moly: the Spaniards, Ropa cova potilla. Now the Blatta is an Insect flying in the night, like to a Beetlesbur wanteth the sheath wings.

There are three forts of Blattæ; the foft Moth, the mill Moth, and the unfavoury or flinking Moth. Freigins divides them altogether fally, confounding the foft and the flinking Moths one with the other, and making the roomseed to be the third species of them, seduced as it seemeth by Gaza's interpretation. That all of them when they are old do shift their skin; both Arift.

bif. 8. c. 17. and Pliny 1. 11. c. 27. do affirm. All the males are supposed to have wings, but the females certainly have none; they also are less, those more bulky and big-bellied. All of them (but the shinking) run very swiftly, and die with cold. The male is soft, the semale of colour more black, it hath a small head, whereout come two long cornicles, every waies movable; the breft, together with the shoulders orbicular; in the body it hath seven incisures; the wings are of the same colour with the body, it seldom flies, but (as the Offrich doth) by help of the wings it doth run very swiftly; it hath a forked tail like a pair of Barbers cizzers; it hath fix feet. It lives about Privies or Jakes houses, ditches and sleamy foggy places, for the most part they are somewhat like the field Kricket, but of a more compact body, and with far more slender

In the Ship called the Philip, (which that noble other Neptune, Sir Francis Drakestook laden with spices) there was found a wonderful company of winged Moths, but somewhat bigger than ours, softer and of a more iwarthy

colour. I have heard by many men of good credit, that there was one of these soft Moths found and taken in the top of the roof of the Church at Peterborough, fix times greater than the common Moth, which did not only pierce the skin of those that sought to catch it, but bit so deep, that

it did fetch bloud in great quantity; it was about a great humbs b eadth in bigness and length, and being thut in between two wals, yet after two or three daies got forth no man knewhow.

The Mill or Bake-house Moth, I have seen : the Greeks call the femile (if I am not deceived, because it had no wings) μυλοικίς, μυλικό, μυλαείς & άξιοκοπίων: it is longer, thicker, and of a more shining black colour than the ordinary soft Moth, with a little forked mouth placed as it were under its belly; the cornicles like to the first, little hollow eyes, or rather eyeholes, the breaft fouriquare, with the four foremost feet fastned to it, the hindermost to the belly; above the shoulders appear as it were little wings, though they are not so indeed; the rest of the body somewhat thick, cut all over round about, circle or orbicular wife; in the sides resembling the form of a saw, the tip of the tail and a fork growing on each fide is somewhat like a Trident : these Moth Krickets take up their abode in warm places, as floves and bake-houses, and such like; let them be never so hungry, they will scarce indure to come into the light; or if they be compelled to to do whereby to get fome food, they betake themselves into the dark again with what speed they can, or else hide themselves in dust that they may not be found.

The third fort is so unsavoury, and carries with it such a slinking smell, that from the same it is called of the Greeks chon Bora, no Baron; of the Latines, Fatida Blatta, i, f. the flinking Moth; it hath thighs fharp with prickles, as Pliny describeth it, the which mark of difinction, if he had not expressed, perhaps this kinde of Kricket had not been known, or seen by me. For the black Beetles (especially the hairy ones) they are altogether of the same form. only the tail taken off. It is of a pure black gliffening colour, very flow paced, as no creaonly the tank pated, as no creature the like; the body fo framed and ordered, that you would swear it were winged and had

Of lesser living Creatures.

sheath wings, nevertheless none of them have any wings, no not the male it felf amongit this fort of them, (what ever Pliny dreameth to the contrary) it hath thin slender long shanks; remains in deep cellars, and is a retainer to the Jakes; it creeps very flowly, but at the least glimpse of light, and whisper of talk, she hides her self; a shamefac't creature certainly, and most impatient of light, not so much for its ill favouredness, but the guiltiness of its conscience in regard of the slink it leaves behinde it, and of its ill behavionr: for it frequents base places, and digs through other mens wals, and doth not only annoy those that stand near it, but offends all the place thereabouts with its filthy favour. The mouth of it is forked, the back covered (as it were) with a sheath wing, so solitary a creature that you shall scarce finde

two of them together. Whether it be begotten of putrefaction, or otherwise generated by the

commission of male and female, is not certainly known,

About Francford near the River Main they are frequently feen, as also in London in Winecellars, and dark dungeons; the other species are more frequent in Bake-houses, and warm places. The stinking Beetle some confound with the Cimex or Wall-louse, a creature of the like quality; but not rightly. The inhabitants of Pers have certain creatures which they call Araners: Serius thinks them to be Butterflies, They are of the bigness of the Kricket, they go forth a great many of them together in the night time, and all that is in the house almost that is soft they nibble about and eat it. Lib. Navig. Butterslies I cannot say they are because they graw, and do not suck with their Promuscis; I would therefore either make them to be Krickets, or some new kinde of Moth, or some creature mixt and made of both. In an Epistle of a certain learned man fent to Gefner, there is a description of another kind of flinking Moth. There is faith he a certain flinking flying Infect in Hungary that stinks beyond measure; I should call it a stinking Grashopper, but that it is more like the Kricket. In Winter it desires the light, in Summer it shuns it; when it flies it makes a kinde of a terrible horrid noise, leaving a most noisome stink behinde it. Some there are when the air is infected, carry this creature about them as some secret remedy, and adore it; nay some of them, which a hog would scarce do, will swallow them, so afraid are they of the Plague, and so desirous to use means against it. They are bred in wals : where they are most frequent there grow as they fay the most generous wines, & I have found it to be true by experience. So far Epifle. All the younger Moths are whitish, but at their full growth of a bright red or tawny. The slinking are as black as a coal.

Divers Authors do speak of four other forts of Moths, viz. the Venereal, bred in the genitals of men; the Bee Moth, the Cloth Moth, and the Library or Book Moth, from eating of the Books: but none of these, but the Bee Moth agreeth with the description of the Moth: but that neither is so stinking as the one called Brion, or so soft as the others before described; but of a middle nature, rather pouldred with meal than anointed with oyl. Of the rest of these we shall speak more fully when we come to speak, God willing, of the Lice and Moths called Tinea.

Much variety of opinion there is among the learned of the colour of the Blat Moth, or the Blattean colour. For if these Insects (of which we have now treated) are the Blatte truly so called, why should not the black be the Blat colour, rather than red purple colours? Certain it is, it is that the Bizantine Blatta yeelds a purple colour, as that of the worm Cochineal doth a red or starlet; either therefore all colours may be called Blattean, or else this last of ours is not one, Indeed I wonder at the boldness of Turnebus and Thylesius, which will have that of the worms to be the Blattzan, when as they are of no Author called Blattz; but rather properly it ought to be counted a Scarlet red. The Blattman colour therefore, to say the truth, is the Purple, notwithstanding our Blattæ send forth no such kinde of liquor; but are sliers of the light, nasty, cruel, lough, theeving, living of nocturnal depredations after an infamous manner, whence Servius cals them Piratas noftu navigantes, night Pirats.

These little creatures, although they are hateful to nature it self, to Men and Bees, yet God Their use hath endued them with fundry vertues, in which they excell the Blattæ Bizantine. For take off his shell or nail, which is there between its head (called papaver) and its neck, what doth the belly contain but the ornament to dye withall, and to delight the eyes with their colour? And be it so that Princes and great men will buy it though never so dear, and by the greatness of the price make it only fit for Kings to wear; yet notwithstanding when you have heard the virtue of these Blatte, otherwise so contemptible, you will say they are far more to be esteemed than purple, For they are wonderful good for the pains in the ears, taken after this manner: Take twelve Blats With their wings cropt off, of old wine and honey and 3 j. and half the rind of a Pomegranate, of the juice of an Apple 6 spoonfuls, boyl them well in a new pipkin till the rind of the Pomegranat be made limber and foft; then beat them all together, which done, add unguentum Syriacum \$ 1. of Tarre \$ 1 fs. the juyce of 4 Onions pressed out what may suffice; beat all these together and lay them by for use; let this decostion be dropt into the ears, and a lock of

Qqqq :

new shorn wool stopt in warm. Galen fec. loc. 1. 3. Experience witnesseth that the soft Blats new morn wood note in the fore Blats boyled in oyl and put upon Warts, are ro good effect. The mill Blat, the head being taken off and the body bruised, doth cure the Leprolie, as Masa and Pithen have left in their Receipts. The and the body branch, when the head is off, beaten with oyl of Roses, Galen out of Architenes faith is very good for the ears; but the wool in which they put it, must by and by be taken out: for that fat substance will quickly breed works. Others write that two or three of them boyled in oyl, bruised and put into a little linnen bag and applyed, are very good for the same purpose; in oyl, bruned and put line a retire in oyl or warm water are likewife good for the fame, being dropped intheir entrails beaten with oyi of waith water are method good to the ears. Pliny faith, 1. 2. 6. 36: that from the two first the heads must be pulled of before they be used in medicine; from the stinking, the feet and wings, or rather that district their contract of the like wings on the back, that being more hard, and more poyionous; but it hath'no wings. The flinking Blatta moreover mingled with oyl or pitch, are faid to cure Ulcers; otherwise incurable: as also Wenns and Swellings in the neck, Botches, being layed on for 21, daies tovether: they cure also the Scab and Fellons, bruised and festered Sores, the wings and feet being first taken off. We disdain to hear of these things, yet truly Diodorus (as Pliny faith) reports that they have helped the Kings-evill, and difficulty of breathing, mixed with Robn and Honey: the most learned thought fit to keep the ashes of them in a horn box for this purpose, or the powder of them to put into the body by way of Clyster. Cardan faith they take away pains; but what pains, or what kinde of Blattæ should do it, he tels us not. The Phrygians and Lycaonians, anoint those with them that have a stoppage in the Matrix. Pliny 1. 30. c. ult. Last of all they may ferve in stead of Castoreum for an Antiballomenon; and Galen useth them in stead of the Bu-

Remedies a-

Now if you would have a remedy against themselves, cast but a handfull of Flea-bane (the Greeks Mascula is the Latines Cunilage) and all the Blats will gather together to it. So called in Rome Blattaria or the Blat-herb. Nature hath provided a remedy against them for the Swallowes; they are wont commonly to spoyl the Swallowes eggs, wherefore they use to sence their young with Parsy or Smallage, whereby the Moths are forced away from their ness. The which might be thought to be the signent of Alian, but that Zoroastes in his Geoponicks doth as signed the strength of the sence of the surface of the s

. CHAP. XIX.

Of the Buprestis or Burncowe, and the Cantharides.

Any of the Naturall Philosophers have made mention of the Buprestis, but so little, that they seem neither to have touched either their form, or qualities, no not so much as their true Name. For Ardonnis cals it Buprestis; Vigelius, veter. 1, 3, c. 1, 5, cals it Vulpester or Bulpester; and in the 78, chap. Busirestis most corruptly. Silvaticus, if any other chief at Barbarism, cals it Busingshifters, Bubestis, so corrupted was the Latine tongue in these blinde times, that Barbarism had wrought a general consustion in all places.

Now the true name of it is in Greek, bloomers, mught in officer ods bits, quia boves rumpis, because it swels Oxen; Nicander in Alex. derives it ab incendendis bobus, from burning or enslaming the bowels of beasts: it is no duudness tendenges and hopes, &cc.

When comes or calves are fick, and bellies swell, They'ave eat Buprestis keepers knowfull well.

For first of all by their acrimony they enslame the belly of cattle, upon which followes a tumor, and a seaver, and a kinde of a hot tympany, by which in the end the bowels are burst. By other, as by Hespelius in like manner suchlan, a suspense, which is more rightly ascribed to that kinde of red little Spider, found in passure grounds, which doth use to bite them. In English it is called a Blain-worm, or Troings, which being eaten by cattel doth produce the like symptomes: the Latines retain the Greek name of Bupressis; of the Germans it is called Gench, Gach, Knoelster, Gualster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, Gualster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of the Germans it is called Geneth, Gach, Mannesser; die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of those of Heidelburg, from Knoelster, die Grunen, Stinck henden, Wildenwentde, Renkasser; of the Germans it is called Grunen, Stinck henden, Wildenwentde, Renkasser; of the Germans it is called Grunen, Stinck henden, Wildenwentde, Renkasser; of the Germans it is call

Pennins reports that he light upon one about Heidelberg, and a true one indeed, who describes it thus: It appears, saith he both in shape and quality to be a kinde of Cantharides, both for its force and properties, (if Galene, Egynera, Phavoriums, Actius, Plinius and Avicen are to be believed) but of a longer body, the outer sheath wings of a yellowish green, or rather of a golden

vellow; the thighs also are longer and thicker, the eyes globous, and prominent, out of the forehead near the eyes come forth two long horns joynted; the head smal; the mouth is wide, hard, strong, forked, having t each with which he doth cruelly wound and bite; the belly not round, but very long; a great foe to the Beetle and the Lizard, aiming at their bellies (as being the fofter and more penetrable part) which prefently the gnawes through, and when the fears to be overcome or caught, presently she recreats and hides her self i somewhat strong of taste (as Actuarius saith) upon the palat. Actius makes it to have a smatch of Nitre both in taste and smell. Cornarius, Lonicerus, and Cordus being deceived by the throng smell of it, could not forbear to say it was the fame with the Cimex or noisome Wood-pews, and called it accordingly Knolfter, and Quelfter. It feedeth on flies, cankers, worms, and other the like Insects, provided she kill them in fight, for those that dye of themselves or are kill'd by others, she will not touch: when she hath filled her felf with the carkaffes of the flain, what the leaves the drawes into her hole, and when the is hungry again feeds on them. Other favage qualities of this little creature let Peter Turner, and William Bremeh (Physicians for learning and integrity of conversation second to none) relate, who together with Pennins at Heidelberg did observe its life and manners. Bellonius in his description of Mount Athor, expresseth the true Buprestis thus: It is (saith he) a little winged flying creature of a most strong sent like to the Cantharides, but greater, of colour vellow

or clay coloured; of fuch exquisite poyson, that the cartle when they have fed there a little while, do die of the graffe infected with its contagion. It hath its abode amongst the herbs caljed Succory, Flea-bane, Nettle, called Vompriffs by the inhabitants of Mount Athon, Thus far Bellonius. From whence we may truly collect that both descriptions of them do agree, as concerning their ill favour, their bigness, qualities; only they differ a little in kinde and colour. For we have not feen any of them yellow, unless I may call a greenish gold tolour yellow. Neither indeed is it fit to fland to much upon the outward flage or colour; but admit that according to the diversity of the climate, they may both receive some alteration (as it is in men) and yet be the same in species. Another Buprestis of the right fort I have seen, the body a little shorter, and broader about the belly, the tail more piked, the head small, the eyes standing out, the mouth gaping, and forked, the sheath wing, for the length of it, chamfered of a full bright grass and gold colour; the legs but six in number, long, proportionable to the body. The Prints of Mathielus and Grevinus, beyond the nature of the thing, and the experience of their own eyes, express eight but more slender, (considering the bigness of its body, than the first fort of Buprestis) and blackish, the cornicles also but half so big, and smaller; it equals the first in swiftness of pace, goeth beyond it in noysomness of savour, year in this it excels the Cimex or flinking wood-lowie her self, and all wilde creatures. It hunts after Flies and Canker worms, wherewith it is fed; so vehement strong it is, that it will kill the most deadly Spider than may be. Pliny faith, that in Italy this creature is seldome found, but now (as we have reason to believe Marcellus Virgilius) they are more common than the state of the countrey can well bear,

But that they are indeed venomous by nature, and very noxious to man and beath, as Actim witrefleth (for they kill both by their whole substance) doth appear even by this, that those which

should give them to any one to drink, were as Budam saith in his Pandects, to suffer death. For so the Law runneth : Qui Buprestem, vel pieyocampen, tanti facinoris conscii, ant mortiferi quid veneni ad necem necelerandam dederit; judicio capitali, & poena Legis Cornelia afficiator, Wholoever shall give a Buprestic or a Pine-tree Worm to drink, to kill any body, or any mortal poyson, being found quilty of such wickedness, shall suffer death by the Law of Cornelius. I have feen about Heidelberg two Buprestes like Scarabens, the one of a golden green, the other of yellowish black, The one like to the former which we have described, but somewhat bigger; the outer wings all over streaked with golden lines, and shadowed with a little green; between the lines rife up boffes curioufly wrought; very swift of pace according to the common nature of that Infect. But that which is of a yellowish black was sent unto me from Vienna by Jacobus Quickelbergius of Antwerp, who hath been a great help to me to enrich this hiltory. The colour excepted, and that it was a little bigger, and had four horns, it altogether resembled the last we described.

The U.c.

1002

Although these Insects are such as hath been said, that they fret with their acrimony, that fretting they enflame, and with their poylonous inflamation cause extreme thirth, and a horrible swelling insomuch that the very skin is burst; yet hath Dame Nature made them notwithstanding very wholsome, which Art afterwards hath prepared for medicine, before they be put in use. Plinius and Eginesa dispute whether they should not be prepared as the Cantharides. Dioscorides dries them in a sieve over hot embers, and so layeth them by. Galen steeps them in vinegar. Hippogrates commands to take off their wings and feet. And because they fret, exulterate, inflame and swell up, and do strongly attract and heat the parts so fretted. Diose. 1. 2. c.59. faith, that being mixt advisedly with fitting ingredients, they may be applyed to the Leprone, Cancer, and wilde Tetters. My opinion is, that they may be used in Read of the bigger fort of Cantharides, rather than some kinde of Blattæ (by Paulus his leave, if I may say so) not only because they are somewhat like in shape and sigure, and in virtue also, as Galen writeth. Pliny said that the Buprestis by way of corrosive doth take away Ringworms in the face. Hippocrafes doth much commend them in divers diseases of the womb. For so he writeth in his Book of the Nature of Women; and in his Book of the Diseases of Women; and in his Book of Barrenness. For the hardness of the womb, to emollient juices and fat add a Buprestis, and we it. To drive our the Monethly Flowers and secondines, prepare half the body of a Buprestis (whether great or smal) with twice as much pulp of a Fig, and apply it; for it purgeth the womb, and inflateth it, and is a frecial remedy to procure the Flowers when they are pait hope. Sometimes he applies only a Buppeffis (if it be a great one) sometimes making a fost pessary, he takes ten, and adds to them a little fawcer of oyl, and mingles with it Wine, Atbiopian Cumin, Sefeli, and Anniteed, of each a-

useth a Buprostis, but warily and with diligent consideration; for he puts it in like a Suppository for one day, and when it doth much yex the patient by corroding, he bids to take it forth: more. over he compounds a Bupressis, Myrrhe, and Elaterium, and puts it in. So he doth also to bring forth a Mola, Gal. l. 1. 20 no cap. 1. Out of Archigenes, describes a Medicament of Buprelles, with Vinegar, Crowfoot, and Wakerobin root, against falling of the hair, Leprose, Elephan-

tiasis, &c. the cure whereof you may easily finde there.

Now as I have declared hitherto its profitable qualities, so (lest I should transgress the bounde

The figns of a Now as I have declared hitherto its profitable qualities, io (left I should transgress the bounds Buprefits be- of history) I shall open the terrible effects that this poylonous creature causeth in man and beast; if a man swallow a Buprestis, 'tis all one as if it had been a Cantharides: the body swelleth, as if it had a tympany, much wind creeps between the skin and flesh, which hapneth no doubt by the flux of humours melted by the poison, and the vapours elevated upwards. The lips are of astrong colour, to wir, of a dead violer. In the mouth there is the like poysonous talle; the flomach, belly, and guts do ake extremely, the urine is stopt, the body is ill all over, as also the head and brain are fenfible of it.

like parts, and whilest they are hot he makes a pessary of them and reth them to the Matrix. In

the itrangling of the womb, when the fit is over, the body first purged, Hippocrates makes a Me-

dicament with a Buprestis, and thrusts it into the Matrix. Also for a Schirrous of the womb he

The Remedy.

A remedy of this is Salt-peter, taken in Wine and Oxe gall. Useful to that purpose is womans milk, suckt out abundantly, and in defect, cowes, goats, or sheeps milk. Womans urine drank, and vomited up again; but before a vomit they ought not be given, because by that means the Feaver would be more thatp. Diefer. First of all therefore of good store of Wine sodden, or with oyl of Mytele Bacon lard, or fat Pork broth, or with good flore oyl of Olive, or boyled Winea L. 2. de Aniid. Vomit is to be made. New Wine drank freely, is held to be a special remedy against the Buprefijs. Galen and Ardonnus. Pliny commends Nitre with water, or Laserwort, Asa dulcu, Wine and Honey, or Bezoin diffolved in warm water; or take red Nitre 4. drams, and in warm water or Posca cause Vomit. After vomit there must be means used for purgation, afterwards use dry Figs (as Galen prescribeth) or a decoction of them in old generose Wine when the fit begins to bare. The Thebane date is prescribed to eat alone, or bruised in sweet Wine or womans Milk: all kinde of Pears, and oyl of bloftomes of Apples, are much commended for this ufe. Nicander commends wood-pears, (for that I think he means by axiology) and especially Myrile berries) following the authority of Dioscorides. For that they do refrigerate and bind, and by that means do asswage the hot nature of the Buprettis, and help the weakness of the stomach. But heed must be taken they be not earen while the body is yet swoin, left the disease be increased by the poylon being kept in. Some with good reason give 31. berries of bladder Nightshade, and with Almonds the make Almond-milk, together with the decoction of Lettice, Violets, Borage, Buglois, garden Nightshade, Plantain, Raisins, and the great cold Seeds. Acting gives the root of Scorpion-grass in sweet Wine to drink. Many extoll the wings and feet of the Cantharides for an Antidote against the Buprestis, but either it hath an opposite quality by antipathy, which makes good that opinion, or else we may suspect it to be false.

If an Horse or an Oxe out one of these flies, presently he swels, growes mad, and shortly after bursterh and dieth. So Elian. 6. de Anim. c. 35. and Hierocles a Greek weiter witnesseth it. He bids to binde the horses head, and to open the veins about his nostrils, that the bloud may run forth of his mouth, and to rub it with Coleworts, and give him Fish-pickle and Oyl: and Vige sim likewise almost in the same words: If a Horse or an Oxe eat a Buprestis with the grass, his belly will instantly swell, he is instated all over, he resuseth his meat, and he often and by little and little fends forth his dung. To

To cure this, Absyrtus and Vigetius presentibe one and the same remedy : presently get upon the Horse and cause him to gallop as fast as he is able, afterwards let him bloud a little in the the roote amouth, and let him (wallow the bloud as it runs forth, chewing it in his mouth, and let him (wallow the bloud as it runs forth, chewing it in his mouth, then keep him continually walking; let his diet be wheat theeped in (weet Wine with Leeks given him with a horn in Wine warm well beaten with Raisins. Some, as Praxanns taught them, pour Oyl into the nostrils of the Oxe, l. 17.6. 17. To Goats that are fivoln with the Buprestis, apply Bacon-lard, or pour the fat broth of it down their throat, faith the same Author.

Of leffer living Greatures?

The Cynoprestis seems to be the same with the Buprestis, for that works the same effects in Dogs as this doth in Cattel: or if it be a different fort of creature from this, I confess ingenuously

Thave not met with it.

CHAP. XX.

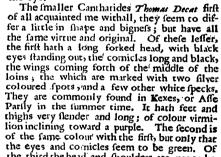

Of the Cantharides, or Spanish Fly.

Know not what the reason was that the Cantharides above the rest so well known, of so great use in Physick were omitted by Pennius and Gesner. Which task not withstanding I shall willingly undertake, and thus I begin their Hiltory. The word we faces in Greek is the same in Latine; in French, it is Cantaride; in Italian, Catarella; in Spanish, Cubillo; in the German Tongue, Grune, Kefer, Goldkefer; in Low Dutch, Spaensche, Vlieghe; in English, Cantharides Or Spanish Fly.

Of the Canthurides two forts have come to our knowledge, the one greater, the other leffe. Of the greater fort there are forthe thick and long, taken in wheat; and fat likewise as the Blats are, drawn with variety of golden lines, which in the wings run athwart, and those are accounted of the best use in Physick. Others are lesse and lean, hairly, called the innermolt, not fo fit for medicine. Of the greater fort also not all are of a glittering green, but some of them of a sad red, but all of them of an

inexpressible splendor, and very pleasant to

the eyes and comicles feem to be green. Of the third the head and shoulders are not to be distinguished, of a rusty colour, and the eyes as black as pitch; the wings of like colour with the head, but glittering with golden streaks, the feet black and short. The fourth is like the third, but only it is rather in colour of grass green, not rusty as the other: otherwise, except the bigness (for it is the least of all) it doth not dif-fer. As well the greater as the lesser of these Cantharides, do not come of living Creatures, but of dry and moist purefaction. The race of Cantharides is bred in wheat and corn fields, and in fig-trees also. The law yas or not the moise of white the transfer of the street of the

Arist. in his 9. Book and 39. Chapt. They are bred also of the sponge of a Rose called dens Caminus, and of the Catterpillars which are found in Fig trees, Poplar, Pear tree, Ash, Olive, Rose trees; for in all these there are worms bred that are the originals of Cantharides, but in the white Rose they are less effectual. The Cantharides couple and generate likewise, but not acreature of their own species, but a worm only; they feed upon pulse and grain, but especially of wheat, and those which are so fed are accounted most fit for Medicine: they smell like Taire, taste like Cedar, as Nivander reporteth.

Their virtue confifts in burning the body, causing a crust, or (as Dioscorides will have it) to corrode, cause exulceration, and provoke hear; and for that reason are used mingled with me-

dicines that are to hear the Lepry, Terrars, and Cancerous fores.

And in being mixt with Cecots or fit plainters, they do cute deformities of the nails, caufing them to fall off. They are used in medicines for Corns on the feet or hands,

uc Some appinitude places where the hair sale off, with Cantharides bruised and liquid Direction

ekin being prepaned with Miere: they are good for Couremes, but care make be had that they do no

CHAD SI.

tion but in aypening they array do good with the inyear of wilde Vine, or with sheaps or Goats fuet. Some of my Malets pur only their wings and their feet into Medicamenta that provoke urine. We, faith Galen, are wont to cast in the Cantharides whole, and we judge those to woke urine. Versian Oaiss and have a yellow girdle running athwart their wings to be the belt, that are found in wheat, and have a yellow girdle running athwart their wings to adorn thems L. 3. & 1. 11. defimpl. fac. also put under, they mighely provoke the terms, and put to medicaments for the Dropie, they are a very good antidote against it; as not only Hipperates, and Dioscorides, but Galen, Avicenna, Radio, Pliny, and the best writers do testific amongst Physics, and Dioscorides, but Galen, Avicenna, Radio, Pliny, and the best writers do testific amongst Physics. heis, and Diojectiaes, the Caracter and August 2 to Caracter and Sum Ammoniac, to divert Catatries, to caracter Gow in the feet and hips, by drawing the matter that lies deep, from the centre to the superficies. Also they are good against the venome of the Salamander, as Pling teacheth 1.29.6.4. Also in some cases and in some compositions, they are good for field as want ejection and do promote venery very much. But as rightly mixt and the hibited in due proportions, they are good for ones health to being not rightly mingled and given diforderly, they cause cruel symptomes and cometimes death. When Anno 1579. I staid at Bafil a cettain married man (it was that brazen bearded Apothecary that dwelt in the Apothecaries shop) he fearing that his stopple was too weak to drive forth his wifes chasticy the first night, consulted one of the chief Physicians, who was most famous, that he might have some stiffe prevalent Medicament, whereby he might the sooner dispatch his journey. But when it was daybreak almost, there followed a continual distending of the yard without any venerous desires. and after that bloudy utine, with inflammation of the bladder, and the new married man almost fainted away, all Antidotes profiting nothing a great while. I remember that the fame thing hapned to a Noble man of Francfort in my remembrance, whom when an illicate Physician thought to cure him of the Drophe by giving him. Cantharides, one in number inwardly, he killed him with lamentable corments. Thave a singular remedy against the weakness of killed him with lamentable comeints. I have a fingular remedy against the weakness of the Genical part, which when I used it indifferently however it did great help to many Noble men and no hut, (who generally are more studious in very gous markets) yet it did one amongst the reft so much harm, that after venery (which he was foot much addicted to) he half the down continually, and swounded away frequently; truly inflight here had been plenty of inflikathand, this Venus bird, had died and suffered deservedly for the Lechery and lactivious qualities. They of Cantharlard are held to be amongst the number of poysons most deadly, not only by reason of their corroductions and inflaming, but by reason of a pure fixing duality they abound with. These more residually they abound with are held to, be amongst the number of poysons most deadly, not only by reason of their votoding and inflaming, but by reason of a purrefying quality, they abound with. Their voyce entring into the veins either from the stomach, or by the skin, destroys a man like to poyson.
Therefore Quid when he wished mischief to his enemy. It. Twis. withes that his genus might
eight him the inyes of Cantharides to drink. Cicero ad Pelanii. 9. Epist. famil. Cannaity its accustation of L. Gradius is faid to have taken Cambarides y at if by that means he was resolved to kill
himself. Gal. 3. de. Simpl. fac. Writ thus I strey by the himself have very small quantity,
mitigled with things strings they powerfully move limbs, and sometimes corrode the bladder
where it is manifest, that all things that kill by a cold quality, if they be taken in a small quantity they may nourish the body: but such as kill by pitterying (as Cantharides do) not at all;
force they are expenses to more arrive. College Remark Studen, well noted for his familia. lince they are enemies to maps nature. Coffiles a Roman Knight, well noted for his familiar liky with Nero, when he was fick of a dangerous. Tetter, a Phylician was sene for by Cafar to cute him, who gave him Cantharides to drink, and so killed him. Phny. Also Cantharides were objected against Cato of Otica, (as the same Author saith, 1. 29. c. 4.) as if he had sold poy-Ion by open fales, because he see them at 60, Sextertia. But when they are drank too largely, or app) yed outwardly too long and too deep, they are wont to produce these symptomes. There happens pricking and pain in the bowels; which is extended from the mount to the forces, and to the loyns, and haunches, and hypochondres, and they ulcerate the bladder with a painful licers and inflame, the yard and the parts adjacent with a vehoment Impostume : then they pils bloud, and after that pieces of flesh. Sometimes there followes a Diarrhota and Dylemery twounding and dulness, and the minds is perverted, and there is nauteating and hetriness, and a frequent define to make water and go to flool; but almost oit is invain. They afte a taste of Pitch in their mouthes: all which symptomes are set down in Dioservides 1.6. c. 1. Gall lib. de The

riac, ad Pison, c. 4, and 1, 3, de Tamper, c. 3, and in Rhafis Hb. 8. c. 17. To chose that are so infected and affected. Dioscorides sind prescribes frequent vomining, there frequency Officers made

with Nitre to cleanse the guts; then to preserve the bladder, he gives mill hwardly and flea-feed. And he will have their Clysters made of other marter than ar firsty samely of Barley

Water, Marflimallowes, Whitasof, Eggs, Mulfilage, of Linfeed, Rice-water, decection of Pent greek, Hydromet, fat Broths, Oyl of twees Almonds, Goole-greate, yelks of Eggs. Allo he bids

the will off a ver needed for edicines for Come on the rice or hand.

the small, sweet new Wine, Ducke greate, a decoction with Diuretick feeds, (namely the four great cold freeds) and decortion of figs with fyrms of Violets. Oyl of Quinces is commended as the certain Theriack for this difeate, as also out of Libbies, and Samian etay. Rhafis after that Clysters of fat Broth are cast in, will have incoction made into the yard with Oyl of Roses, and the fick shall be put into a warm bath in a great Vat. sit. 8. c. 17. Authors are not agreed in what part the poylon of Cantharides doth lie. Some think it lyeth in he head and feet, and others demy that; yet they all agree that the wings are an Antidoth in what part foever the poyson lyeth; and those being taken off it is deadly; so that this venome hath its remedy joyned with it. Plin. l. 11. c. 35. Lyrus of Naples writes that Purlain is an Antidote against Camharides, which Pliny 1. 20. 0. 13. affirms of white Basil: who also \$ 23. 6. 2. and 4.1.28 c. 10. Commends very much Vinegar of Squils, Oyl of Dill, Cowes Mills and Broth of Goats Aesh. And this much shall suffice for the History of Cantharides, which I wonder that the most learned Gelner, and especially Penniss overshipt.

Of leffen living Creatures.

CHAP. XXI.

HE Beetle is an Infect that may be called wareholder, as if he had his wings in a sheath. The Name It is bred of putrid things and of dung, and it chiefly feeds and delights in that. The Greeks call it reflacer; the Tyrians, Auppors the Germans Kaefer; the Italians Efouravaio, Pololere; the French, Escarbor; the Polonians Kremka; the Illyrians Krabak; the English; Beetle, or Bug; the Northern English call it Klock; but the Southern, Starkenicken; the Arabians, Kanasis and Their Sexand Kanasis by Avicenta. The Greeks all with one consent, holdshat all Beetles are males, whence Description. one may easily understand the sense of Ansonism his Epigram upon Marcus that was gelded. Rhodiginus I. 8. c. 5. Antiq. lett. renders it to us. Alfo the Agyptians caused a picture of this creature to be made on the flatnes of their Heroes, intimating thereby their manhaod, that had no mixture of feminine weakness; for men must be valiant and manly, femilie pullaminity is a great diffraction them. All Beerles cast their skins, and they have the property of them they are afraid, and they leave off to move, and they grow have the did vainly ascribe to them four wings hid under a crusty cover, for experience she make two. very tender and frail, wherefore they have them that up in a hard cover over them to deeped them that they may take no hurt by hard bodies. For the greatest part of them either das under ground, or bites rotten wood with their teeth, and makes houses and nests there: so that if they were not excellent well guarded, they could never keep themselves safe from external injuries. When they fly they make fuch a hunming or noise in the air, that Laertine Wit that the gods talk with men by these creatures. Of all plants they cannot away with Rose trees, and they have them as the destruction of their kinde; for they dye by the smell of them (as we read in Goopas) but on the contrary they take great pleasure in stinking and beastly

I remember one was wont to cleanse privies, when he came into an Apothecaries shop ar Antwerp, and smelt the spices, he presently fell down in a swound, which one of the standers observing, he went and gathered up some horse dung in the street and put it to his nose, and to a man used to flinking imels was recovered by a flinking imell. Therefore it is no wonder if a Beerle (that we faid before was bred and fed with dung) being anointed with oyl of Roses, be killed thereby; they are the words of Clemens Alexandrin. 2. Padagog. which also Plutarch elsewhere, and Elian also affirm. They abhorse the smoke of Aldad, especially of the kayes as of Pallamus, Aceri, Cow dung, and Nigella feed, Rhafis 88. The Hemerocallis of Dioforides, is called by some demoistages, for the great force it hath to kill Beetles: but as they do extremely shum those plants, so they very much affect Ivy to be under its shade, and they naturally delight to go under it, under which when they are gathered in heaps, it is an ease matter to catch them, for they will hardly go from it. Beetles are fome greater, fome lefs. The great ones, some have homs, others are without homs. Those that have home, some are like harts horns, others like Goars horns, others have Buls horns, others have Rams horns: some have horns in their moles: we shall speak of them all in order. The washingers or Harts horn Beetle is called Lucanus by Nigidius; as Pling witnesseth. Some call it the Bull, others the flying Stag : Heffehim cals it wood, because it laies hold on things in its way with thomy horns; the Comedian van el Enfathins call it in resistant, because it is the greatest of all; Car danns cals it onegotiones, a word compounded of Greek and Latin; Gaza vals it weeks, the Italians call it Covers, and valgatty Polapelo; the French, Cerf volume; the English, Song-fro or Flying by; the Hollander, Visighande here; the Illyrians, Oelin; the Poles and Clavorians Krowha, Welke. Amonget all the horned Beetles for the fnape of its body, length and magnitude, it may challenge the first place, and is the most noted. It is blackish, of a dark red, especially about the outward cover and the breast; it hash two whole home without joynts, and with branthes like a flag as fong as once thirle finger in fuch as are grown up, but they are less and shor-

ter in the young ones: or (as Pliny faith) it hath long and movable horns nicked with cloven placers, and when it will it can bite or nip with them. For it will close them wonderfully, and useth its hornes for that end for which Crabs and Lobsters do their clawes. The eves are hard, putting forth and whitish, it hath fores vards on both fides of them, one pair that are branched between the horns & the eyes, the joynt whereof makes almost a right angle, and two more breaking forth of the midft of the forehead straight and plain, ending as it were in a little smooth knot; it goes upon six feet. the fore feet are longer and greater than the rest. Lanicerus makes this to be the male : but I (if there be any distinction between the male and the female) shall not doubt to call it the female; both because the other kindes of beetles are less, (for as Aristotle observes the males in Infects are far less than the female) and also in copulation the females receive from the leffer, as experience confirms it. The male is altogether like it. but 'tis less both for body and horns; which though they be not branched on both fides, yet prefled together they do more sharply prick ones, finger, than the female doth. The third is three or four times less than the former: a black colour, with little cloven horns, near to which there arise two fore-yards diffinguished with many joynts. It hath eyes a little standing forth, and that are great in respect of its body. The shoulders on both sides end in an acute angle. It feeds for

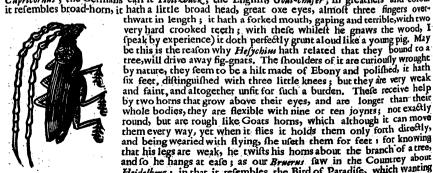

the most part in a clammy fat juyce coming forth of the oak; nor is it easily to be seen but where oakes grow. The fourth kinde is very rare, it hath two little horns, thrice branched inwardly, they feem whitish from black, the back is parted with black and white spots, but the belly with filver coloured and blew. It goes on fix feet, which are no less black than the fore-yards: when the head is cut off, the other parts of the body live long, but the head (contrary to the usual custome of Insects) lives longer. This is said to be dedicated to the Moon, and the head and horns of it wax with the Moon, and do wane with the Moon, but it is the opinion of vain Aftrologers. The homs

are not without their Medicinal vertues; for they cure childrens diseases; for hanged about their necks, if they be great horns and full of branches, they ferve for an Amulet. Laid to scrophulous humours and the Gout, they help much especially if they be applied with the earth they have call up. Pliny. If horned Beetles they call stags, be boyled in wine, and the arteries of the armes be anointed with it, it cures Agues. Miraldus. But I note by the way, that Guillerinus of shell fish, was not very wife, who writing a Book of the Nature of things, was quite out, when he placed that flying Stag amongst the Grashoppers; sometimes he makes it a Local, fometimes a Bruchus, fometimes he confounds it with a Glow-worm, conjecturing every way, but teaching nothing. The Philosopher saith that those Stag-slies are bred only from worms The name and growing in rotten wood, But I rather approve of it, that they breed from dung as experience testifies. 'Αιρό καρως, τραμόκιμως, κιεό μιβυξ, κιεό μιβυλος (these are words that are synonymous) in Latine, Capricornus; the Germans call it Holtzback; the English, Goat-chafer; in greatness and colour

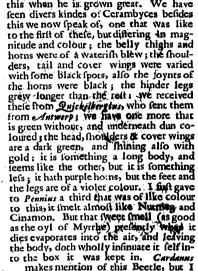

> thwart in length; it hath a forked mouth, gaping and terrible, with two very hard crooked teeth; with these whilest he gnaws the wood, I speak by experience) it doth perfectly grunt aloud like a young pig. May be this is the reason why Hespelius hath related that they bound to a tree, will drive away fig-gnats. The shoulders of it are curiously wrought by nature, they seem to be a hilt made of Ebony and polished, it hath fix feer, distinguished with three little knees; but they are very weak and faint, and altogether unfit for such a burden. These receive help by two horns that grow above their eyes, and are longer than their whole bodies, they are flexible with nine or ten joynts; not exactly round, but are rough like Goats horns, which although it can move them every way, yet when it flies it holds them only forth directly, and being wearied with flying, she useth them for feet , for knowing that his legs are weak, he twifts his horns about the branch of a tree, and so he hangs at ease; as our Bruerus saw in the Countrey about Heidelberg; in that it resembles the Bird of Paradise, which wanting

1006

Of leffer living Greatures. CHAP. 21. feet, clings about the boughs with those pendulous nerves, and so being tired with labour, takes its case. They thrust upon us some German fables, as many as say it slies only, and when it is weary it fals to the earth and presently dies. Those that are slaves to tales, render this reason weary it Terambus a Satyrist, did not abstain from quipping of the Muses, whereupon they transformed him into a Beetle called Cerambys, and that delevedly, to endure a double punishment, for he hath legs weak that he goes lame, and like a thief he hangs on a tree. Antonine Libealie for ne natures we are that he your latter and like a three words: The Muses in anger transformed lib. I. of his Metamorpholis telates the matter in these words: The Muses in anger transformed Terambus becams he reproached them, and he was made a Ceramby's that seeds on wood, he is seen upon Teramous vecanje ne reproacace energy and ne was made a Cetality, spat jeed on wood, he is seen upon wood, and he hash crooked teeth, and he alwaies moves his jawes; he is black and long, having wings on his belly, as the greater Beetles have; he is called the Wood-cater One; but in Thessay, Cerambyx. The children catch them to play withall, and shey pull off its head and carry it, and it shews with the horns like a harp made of a Tortow hell. Which words, whilest Xylander strove to put them into English (one otherwise well skill d in the Greek tongue) he committed two great errors; first, by taking Cerambyx for a Bird when he called it a Fly; fecondly, because he translated it, that the head with the wings are like a Harp, when as the Greek book hath it the horns. But whether this bethat kinde of Beetle that runs up and down, and makes a noise like a kid in the leaves of Eriphia; (the Wizards say there is no better remedy to cure the voice) truly I am ignorant of Eriphia; (the Wizards fay there is no better femous to the transle gigant would scarle contain it, but I suppose it is the lesser Beetle, because the stalk of Fennel gigant would scarle contain this when he is grown great. We have feen divers kindes of Cerambyces besides this we now speak of, one that was like to the first of these, but differing in magnitude and colour; the belly thighs and horns were of a waterish blew; the shoulders, tail and cover wings were varied with some black spots, also the joynts of

know no man that found it before me. There is yet one of a shining black, that hath a great belly, thick, with a body and horns shorter than the rest, the joynts of the horns are not round as they are in the rest, but lightly saw'd on both sides. Pennins saith he is beholding to Carolus Clufius for it. The fifth is altogether like the first for head, mouth and reeth, with very black eyes; a brown colour all over the body, a mouth wide open and dented; the head neck and wings are belpotted with very small black spots; the body of it is almost as great as the second Cerambyx; it is but seldome seen, it lives in houses and dry wood. The fixth is ash-colour with a very little head, they eyes are both white, the horns are somewhat long, joynted, distinguished with white spots; the coyer wings, and almost the whole body

The Ufe.

is various, it is conversant in houses, but whether it dwell in wood also I know not. I saw the seventh brought from Russia by Edward Elmer, it was brownish all the body over, it had round joynts on the horns 7 or 8, it is easily known by its form. There is an eighth kinde not far differing from this in figure and magnitude, but that the head, shoulders and wings are blewish, for the same of the processing from this in figure and magnitude.

Joachimnis Camerarius ient a pinti to Femanic the was one that deserved ingularly of the Common-wealth of learning) the wings and feet were of a sandy colour; the head, the horns and belly were blackish; he had bowed horns made with many turnings and knots, which he turned to both sides in the twinkling of an eye; it creeps upon plants (especially on Cythisus) I think the Heetle which Tobannes de Chaul describes lib. de varia quercus historia, ch. 26, is of this kinde: There dwels a creature in the oaks, of the kinds of Beetles, (so far as we can conjecture) it is of a blackish colour with long legs, carrying two prickles in its head a little crooked, where with he layes sail bold of what he meets with. Those Carpenters that hem simber of oake, sound this little creature alive in the very heart of the oaks. The countrey people of Lyons call it Thurto; it lives best and longes in roofs of bouses, and it sometimes comes forth and hower it self making a little noise, in places where koves are. Gesner, of pious memory, Epist. 1.3, say inch a one, or one like it, voided by an old woman that was sick of a Pleuresie, his words are these. An old woman that was sick of a Pleuresie, his words are these. An old woman that was sick of a Pleuresie, his words are these. An old woman that was fick of a Pleuresie, his words are these. An old woman that was fick of a Pleuresie, with a decoction of Ennugreek 1, it had long feet, horns that were joynted and were flexible; it was full of raw putresactions and alive; it was as long as two joynts of ones singer. The tenth is all purple coloured from black, and hath a sorked mouth. The eleventh is all black.

The twelfth hath horns than are not to much joyned, the head and shoulders are blew; all the rest of the body seems a bright red. However you see the horns of all these, some straight, others crooked in their pictures, (for to explain their the better) yet for the most part they, wear them with a bending of them backward to their shoulders, as goats do, as you see the first grantyx: and upon that account I think it sit to just them into the same rank. And thus much directambyx, or Capricorn, and its kinde.

I have learned no other use of them in Physick, thin that taken in the less hand, they drive away disarrain Agues. Plin. 1. 30. cap. 11. It may be possective, by better experience will disover more of their vertues, and will not differ themselves to be perswaded that a treature Godhammade so curiously can want rare vertues in Medicaments, which he hath bestowed on sa base things (according to his goodness unto mankinde) Flitter-mice take this for their chief dainties, and prefer it before Gnats, especially if they can catch them and squeezo them alive.

Blaque, or Tavelsque, Oxe, or Buls horns rather, hath alwaies two horns standing straight and right forth; it is blackish from red, and seems almost without any head; yet it hath a very small head such into its short thick shoulders, and a little thorn comes forth of the middle of the foreheads very sharp for defence. We have seen four kindes of Nosehorns, the chiefest and greatest of all lives in Isr dia, it is very black, it shath a nose on its sace crooked horn'd like to the stern of a ship; about the middle whereof there is another.

horn bent inward, and comes forth of a little knot; and such another comes out of a bunch on the shoulder; the whole body from the end of the horns to the tail is four inches long, and it is about two inches broad. Like to Beetles it hath no female, but it shapes its own form it self. It produceth its young one from the ground by it selfs which

Josebi Gamerarius did elegantly express, when he sent to Pennius the sliape of this Insect out of the storehouse of natural things of the Duke of Saxony; with these Veries:

A Hee began me not nor yet did I proceed From any Female, but my felf I breed.

For it dies once in a year, and from its own corruption, like a Phoenix, it lives again (as Moninus winesseth) by heat of the Sun

A thousand summers heat and winters cold When she hath selt, and that she doth grow old, Her life that seems a burden, in a tomb Of spices laid, comes younger in her room.

CHAR. QI.

The second kinde of Nose-horn very rare and wotthy to be feen, facred to Mercury, Carolus Ciufius fent painted from Vienna, where it is very frequent, the form is as you see it it would seem all pitch colour, but that the belly is a full red; that crooked horn in the nose is so sharp, that (what is said of an Elephane going to battle) you would think it had got an edge by rubbing it against a rock. The third Nosehorn, and fourth feem to be alike, but that the former hath wings growing out longer than the sheath covers, but the others are shorter. You would say they were rub'd with shining ink, they are so perfectly all over black. The Ram or zerbrews, hath knotty horns, violet colour, a head greenish from gold colour, the moulders like vermilion, a purple coloured belly, sheath wings of the colour of the head, it goes forward with legs and feer, of a light red, but the wings shut up in the sheath, do fitly express the small whitish membrane

The greater Beetles without horns are many; namely, that is called Pilularius, and another that is called Melolanibes; another purple, one again that is dark coloured; one called Arborem, and another Fullo. Some call the Pilularius the dunghill Beetle, because it breeds from dung and filth, and also willingly dwels there. The Greeks call it words, and showstonese, and from its form like a cat, hincejuage is the Germans, Rosfinger, Kaas, or Mishkafer; in English, Dung-beetle, Shambugg; in French, Fouille merde, as you would say Dung-digger; the Latines call it Pilularius, because it turns up round pills from the dung, which it safhions

Dung-digger; the Latines call it Pilularim, because it turns up round pills from the dung, which it fashions by turning it backwards with its hinder feet. Porphyrie doth thus describe the nature of it: All your Pilularii have no semales, but have their generation from the Sun; they make great balls with their hinder feet, and drive them the contrary way, like the Sun it observes a circuit of 28, daies. Elian saith almost the same. There is no female Beetle, it puts the seed into a round ball of dung, which it rowls and heats in 28, daies, and so produceth its young. They would say

CHAD SI.

thus much: that the Beetle called Pilaleries makes a round ball of the roundness of the Heavens, which it turns from East to Weststoley afterwards to be in the pilaleries by the state of the world; afterwards to be in the pilaleries which being cillolver in wire; the which being cillolver in wire; the which being cillolver in wire; the growes up to be a string to and that fumbling back again, at length in execution is a little that the structure of the hold out one winter. They chiefly delight in the shade of the Ivy-tree, as most healthful for them. Praxanus in Geopon. I have tet down the form of it so exactly, and in its colours (for it is all black) that I need say no more. Beetles first breed from dung (saith Johan. Langins) as the Worms beed out of rotten wood: then their feed being shed into a round ball, and the same being enlivened, breeds their young ones: every one knowes this fifficiently, unlesse they live where no dung is; for in danghils they are obvious to every. Man.

Beetles serve for divers uses, for they both profit our mindes, and they cure some infirmities of Their ule for our under frame our bodies. For when this living creature, (and scarce a living creature, for it wants some senses) dings, and by being of the basest kinde of Insects, and nothing but a crust, doth excel man in divers faculties: this should teach us modelly, temperance, labour, mignanimity, justice, and prudence. For this should teach us modely, temperance, labour, mignanimity, junice, and prudence. For though its houle be but a durghill, yet it lives contented the ewith, and is busied and delighted in it; not doth it more willingly drink or entraining the Roses than in Goalfactung, which smels in its senses as sweet as Murjoram. For it lives by the law of Nature, and will shot exceed her orders. The greatest care it takes, is to make the greatest bals it will also underful labour irrollers from her; and if it chance to religious burden against some which with wonderful labour irrollers from her; and if it chance to religious burden against some heap, that the bats slip away and fall down again, you would imagine that you say fight rolling a stone to the top of a mountain, and falling back again ipportain, yet is it not weary, nor will it rest, till it hath rolled it to its ness, so earnest it is about its work. But we poor men do nothing that is worth our labour, or as we have power to do, and we give off in the very fleep entrance of vertue, and we frend all our pains and daies in idleness, following ill counsel, till we get a hibit of mischief to our own destruction. Who dorst not see the courage of the Beetle? if he shall observe him fighting with an Eagle (as 'tis related of the Beetles in India) Ibelieve that it will come to pass; (as Erafines faid) that some man extremely favouring the Roman Commanders, will lament for the Eagle, that the combate fals out upon to kingly a Bird to fight with so mean and despised enemy, so to conquerit, it is no glory, but to be conquered by it is the greatest sharte, and the Beetle will win praise enough that he strove with an Eagle shough he should be overcome. The Poets say that Ajax was ashamed of so weak an adversiry as Uhf fer was, and valiant Captains diffain to contend with common fouldiers. Again, a man would wonder whence this mean Infect hath gained fo much courage, and boldness, that it dares wage war with the strongest of Birds; also whence it hath means, force, faculties and patience, that it can contend to many years with the Eagle, without any reconciliation But if any man will unfold this fecret, and view this contemptible creature nearer, and as it were at home, he shall observe so many rare properties of it, that when he hath considered all, he will desire to be a Beetle rather than an Eagle: yet that no min may stop or stay me before he knowes the matter: Piette rather than an Eagle: yet that no min may top or tray me before he knowes ne manal. First of all, it exceeds the Hagle and men too in this respect, that it yearly engayed read ago, and growes young again. This is so great a matter, that I think all earthly potentially when they come to that unamiable oldage, that they must part with all, would rather with Berles change and cast off their dregs, than they would receive a seven sold Crown; Anglin, which have courage of the minde is there in so small a body? What an heroical magnanding? what as force it hath in burst? The selection of the mass and the selection of the magnanding. in battel? that Homers Fly is nothing to the Beetle. It hath not a wit so common, but it was of old reputed for it, and commended in all places. Hence was that Greek prove b Karbary probless, Wifer than a Beetle: whereby they ascribe to it, a singular and incomparable wisdome. Not doth that concern me if any man will cavil and say he dwels ill savouredly in an uncomely house, for I shall rather justly condemn their houshold government, who being ill savoured themfelves, and of filthy conditions, do build their houses curiously and lostily with so great care, and charges of King Attalus. Moreover, that it useth the excrements of living creatures for its own commodity is no fault, but a commendation of its wit and ingenuity. As though we that are Physicians did not the same things, as often as we apply the bload, the flesh, the irine, and some

ling and being broken, the young ones while they are yet unfhapen, being daffit milerably against the stones, are deprived of life, before they have any sense of it. Neither do I see indeed how the should more torment the sagle than in her young ones. For some who slight the greatest tormens of their own body, cannot endure the least torments of their sons. We see Asses, (those sluggish and almost sense or catures) run to the help of their soals through fire, if it be in their way, with a strange contempt of their life. So that I cannot but admite and magnifie the Beetles inbred wisdome in the choice of its revenge. But enough of this left I should seem to have made (not an Elephant of a fly, but) a Gyant of a Beetle. I will confess indeed, this as I was loath to make a great volume about a small thing, so I accounted it a street bury insidence what I had read. I wonder at Ponnial's brevity and emptiness in this arguments time in Lucian, Pliny, Homer, Aristophanes, Theoretien, Alexandrians, Erasmus, and infinite other Authors, wonderful things are recorded of the Dung-Beetle, well worth our mentioning?

There is another altogether like the Dung-Beetle, but of a darkish bright blew colour, with a notable shining. This in the moneth Angast is troubled with lice hanging between its legs, and at last kill d with them. I should rather take this for the car-fashioned Beetle, because an egge is not more

ther take this for the cat-talhioned neetle, pecause an egge is not more like to an egge, than this is to a cat. It is met with every where, but I have more often feen it about Colchefter. Let us go forward.

That which I should call the Emerald coloured or greenish Beetle, the Greek comick Poets all of them call purandors the arrive unadres and xpoorable. Emfath. Some likewise call it xpoorable and xpoorable is a missace, but without right. It is taken by some to the Tree-Beetle but its place tels us it is a missace. The Rustick in Lombardy call but its place tels us it is a missace. them Gallerness, as much as to fay, French Palmeringms (48 Niphus interprets it) though yet they agree in nothing with Ralmer-worms. In

Dutch it is called Gruenen, Odor, Genlakafer; in Italian, Mariola; in Polonian, Zielonakreroka; in English, Greenchafer, The opinions of writers are divers about this little treature; both because this kinde of Beetle is not every where easie to be found, as because if semieth to be very near the Cantharis. Some will have it to be the Cantharis, but for the most part there is wanting in it that cautick virtue. The Scholiast upon Arisophanes calleth it Zatho xe oco working the sun or, a little creature of the colour of gold like a Beetle. Enstathing cals it a great Wasp. Poller affirms it to be a little creature which flies, but fets not down its kinde, Gara translates it Gallerneas, but it hath nothing like it; and they who contend that it is a Tree-Beetle, have either loft their eyes, or cannot diffinguish varieties of colours. Helyching makes it a Beetle, but of a golden colour; as the Scholiait upon Aristophanes, yellow: later writers call it the greenish or Emerald coloured Beetle, but shining as it were with gold, Marcellus Empirical intimates as much in these words: the green Scarabee (the Greeks call it unholded) is of a lighty emerald colour, by reason of the pleasantness whereof, it is so delightsome and beneficial to the eyes, that

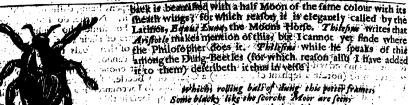

they can never be weary of it; for the longer you look upon it, the more you would be in love with it, Pliny also saith the same, 1, 30, 5, 70, 6, 29. c, 9. The male is green all over, except the eyes which are ruddy; the sheaths of the semales wings (which is the bigger) seem to be of a chesnut colour, shining with a delight-some and beautiful brightness; otherwise it if like the male. The breast of them both stands out with a sharp point, which I have not observed in other Beetles. P. Deickelberg an Apothecary of Answerp, but one who was to be presented before many Phylicians for his studiousness about things natural, sent to Pennine a male and semale of them, painted as it were with Apollo's hand. Ariftos. I. 9. de Respirationes afcribes to it a firtill found, which perhaps gave occasion to fome to call this the Tree-Beetle. They are generated (faith the Philosopher) in the sundant if is role Bodloss, if it orison, that is, of morms which are in condung, and of afferdang. But Suphamus out of Theophraftus faith otherwise, yies I wanders in me admires in unsuperhaps the conductive that it is the suphamus out of Theophraftus faith otherwise, yies I wanders in me admires in unsuperhaps. i descubrac deller seenalauten, &c. The Melolonche is bred of the blosoms of Apple-trees, or at least it flies to them when they begin to blossome, We are beholding to Charles Clusing for another kinde of this Beetle, whose feet are black, as like. wife its head and shoulders, but from blewish. It hash horns in appearance, but not so indeed (wherefore, we reckon it amongst the sweets, or horniers Beetle) its theath wings from to be furrowed; but about the edge they are forme-

what red. This is us of another notable kinds of Melolathe (and I have here forced to youthe figure of it) in their words: it is green all over, except their yes flor choice. are exceeding black); its belly from golden is a little rad, and to let thighs; the middle of its

sphich rolling balf of during this porter frames,
Some black, like the foorche Moor are feen;
The nobler love are decke with green!

The back bath (to compare great things with small)
A mark, you may the balf Moon call. The Buelift call't the Moons horfe, fo renown'd. But had there e're fo fair been founds. Many a Semiramio would love us then, And Centaures had out numbred men.

And indeed molt of the Beetles are hide the black; yet I make no question, but some of them have the first fining with a blacker, others with a more pleasant green. The site allothat thine like gold, and those very great ones, which dig up the earth, and make their nests there. Some there are which fly about with a little humming; some with a terrible & with a formidable noise, so that they would not a little fright one that is not aware of them. There are other differences also of shapes amongst them: but their breeding in dung, their feeding, life, and delight in the same, this is common to them all. Another Beetle of a purple colour was brought to us from Confiner neerie or a purple colour was bought to its from Con-finatinople, which (only that its eyes, belly, and feet were like pitch) was all over of a purple and violer colour. The black one, which lives in dry wood, is formed after this manner. It is all over black, or ruffet rather, as if it were clad in mour-ning; its mouth is forked, its flootilders almost foure, its legs and horns somewhat short; in selectione slies, but goes for the most part, and murmurs while it is going, as lewd servants use to do. The Tree-Beerle is very common, and every where to be met with, especially in the moneths of July and August, after Sun-fet: for then it flyeth giddily in mens faces with a great humming and loud noise, and vexeth carrel. These Beetles spoil the leaves of trees, which they do not so much eat as tear in pieces out of an inbred malice; for they feed upon gnars, We call them Dorrs in English; the Dutchmen, Baumkafer, Loubkaefer; Je. Agricola I. ale subterr. Anim, Sunkeser; the French, Hannetoni. The sheaths of their wings are of a light red colour, and covered as it. were with a very me flower, otherwise they shine but a little, their legs, see and prickly tail are of the same colour: its other parts are all the brown:

yellowish, and of the same colour are they a little above the beginning of their and the colour are they a little above the beginning of their and the colour are they a little above the beginning of their and the colour are they are much more instructions every thirdly and therefore they tail it L' an der hannetons. It is recorded in our Chronicles, that in the year of our Lord 1574. on the 24, of February there fell fuch a multitude of them into the River Severn, that they stopt and clog d the wheels of the Water-miss: and indeed, unless together with the industry of metr, the Hens, Duck's Goat-milkers, Castrels, Bats, and other Birds of prey (which seem to make their dainties) had afforded their help, the Mills had even to this day been choaked with them and stood still.

There is another taken to be of kinto this, of a colour bill of the physick I white, its belly gray and as it were heary. Of what was the physick I confels I know not. Fowlets indeed when they have the first bait their hook with two or three Dols of tree Beetles, and tye a lieuw some to their lines, which they cover with flags, that their wiles be into devered: the Duck for greediness of meat inefently swallowes the hook, with these wapped up in a goingly he that hat ha milities know may read Geher to only the that hath a milities know may read Geher to only the Beetle which Pliny cals Fulla's more three and not every where to be met with. Reserve when to be feen here in Burgland, to far as I have heard of read

read. Gaza sometimes translated that which Ariffeele cals moreoff Fullo, whereas he alwaies intended

CHAP. XXIII.

Of the Cyl-Beetle, and the Water-Beetle.

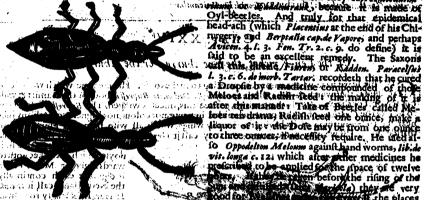

T is called Profearabous in Latine; in Paracelfus, Moloe; Agricola, Pinguiculus, from the far sweat like honey which plentifully drops from it. The Greeks call it directors and hand which it is called by the Germans from the moneth which it is feen in for the most part, Mayor Warmlein, and Meyen Kafer. Those of Heidelburg have put upon it the name of Schmalis worked, those of Dithmaria, the names of Ever and Kadden, (Wierus tellifies in his Book de wogbel, those of Dithmaria, the names of Ever and Kadden, (Wierus tellifies in his Book de wogbel, incogn.) in English it may fitly be called the Oyl-beetle, or the Oyl-clock. But why it is rather called Profearabem than Scarabem, contrary to the

intention of Gefner and Pennins, I could alledge many reafons, but this especially, that they are distinguished in fex, and that they couple together. You see here the hipsels of the semale, and you perceive that it is bigger than the male, and for the most part of a diverse shape; for its mouth is not at all forked as the females is; this allowon the lightest motion or touch, runs with an oyl, (like liquid honey) the male is alwaies observed to be as it were dry, They couple, as we have often feen it in Heidelberg fields, tail to tail; the female in the act drawing to it the male (after the fashion of dogs) so that it is forced to creep backwards; they have both tender bodies, betwist black and dark blew thining: upon whose shoulders there grow two wings, or rather beginnings of wings, as upon the Estrich, to help the swiftness not so much of its flying as bitrich, to help the swiftness not so much of its slying as of its going; those circles that compais the belly and the back, appear green in the young ones, in those that are more grown, blew rather. If they be brifled, they yeeld a most pleasant smell, as Taxine, affirms in this complism, it feeds especially upon violet leaves, blis in the leaves of tender young grass. They are feldom seen up in the month of May; all the rest of the year they keep their holes, or having first wrapped up their seed in round bals of dung, they die. At Heidelburg and Franched we have seen many of

having first wrapped up their feed in round bals of dung, they die. At Heidelberg and Francford we have deen many of them in the fields, in the passure ground flow But I have and even in the very gardens and them four-footed, found none yes in England alive and bred there. Only Agricola hash made them four-footed, whereas indeed they are all fix footed, upon the mittake perhaps, or mance of having met with an only beatle, which had had two of its feet pull'd off. Wirms's Oyl-beetle, if you see it lie upon its back, seems (unless this old man makes short only) to be made after the foure of a man its back, seems (unless this old man makes sport only) to be made after the figure of a mass face. It hath gotten longer wings than the rost, and is marked with more rings or girdles going sound its back, seems (unless this old man makes sport only) to be made after the figure of a mass face. Aristote; that these fire-flies are bigger than Mice (not Flies only); where it is evident he foully mitrook, for the said Mice. for Flies; which Xylander his Translator, took no notice of In shape it is somewhat. He a very big Gnat, of a bright thre-red colour, glittering with a kinde of fiery raise; it leaps, goess flies. and lives in the flame, as Ariffeth reporteth, 1. 5. hift.c. 19, For I can farrage required to Alian 1. 2. Hift.c. 2. when he faith that the Fire-fly as foon as it hath gone out of the place. where it was bred, and flown into the air for food, dieth prefently: for I cannot believe that any thing bred in the fire, goeth out of its element to leek for food; nor is it likely that Nature that most loving parent of all things. Mould prefer the any creature fuch a way of gerting its took by which it should presently lose its. Neither is it, as it seems, to me, to hard to find one the reason of this their sudden dying in the air (which, Liter, leaves to be searched our by others) for being bred in the extremity of heat, how should they live in a temperate place? Forit is evident by daily experience, that some Fishes dye as soon as everthey are taken up ontof the water into the air; much less can those creatures that are bred in the fire, endure the air.

fince it differeth to much from the air, and indeed more than the air from the water.

These Flies are bred in the Brass Furnaces of the Isle Cyprus, where the Chalcitia (or Brassflone) is burnt for many daies together: perhaps the footy vapours which go up with the flame, while the flone is continually burnt, are the matter and cause of their gene ation. Strato Deaking in his 12 Book of Worms beed in the flow, addeth this which followeth: The the matter and cause of their gene ation. Strato Deaking matter and cause of their gene ation. Strato Deaking matter and cause of their gene ation. Strato Deaking matter and cause of their gene ation. Strato Deaking matter and cause of their gene ation. Strato Deaking the strato Deaking and the strato Deaking the plates of brass; where any man may see the error of the Interpreter, for he renders it thus Herum animalium generationem talem putant, ut culicum ex flamma & brattea metalloruma they are bred in the flame (as Scaliger (aith) nor, it malla, that is (as I interpret it) in the flife which is condensed together: nor doth any thing forbid but that the most dry animals may be generated in the most dry element. (for there is mixton there also) as the mostlest, are in the most dry element with us. But what hindes but that living creatures may be generated of matter ready for them, or what natural reason contradicteth it. They answer, that the delitroyeth all things, contributed all things. But they which have had but any talke of the sets of Philosophy, do evince that to be falle by clear demonstration and, experience in 1948. far is our fire from deltroying or corrupting all things, that it even perfected fome. It dots not corrupt nor confume gold, nor some forts of met. Is, not ashes, not the flone Amantar which is very like Sicil Allum; nor some other things which I will not now thand to reckon up for those froward mens sakes. What then should hinder fire stom having the power of generating, so it be in a fir and convenient matter? its very dimes cannot hinder the generation from coming to effect; because it proceedes from the som; but fire is the matter and the sorms instrument, for some operations. Besides, our fre hath alwaies some moissure joyned with it; so it would not take flame nor burn, if it were not cherished with a fat moillure; for certainly those things are netther without earth nor water, which are generated in our terrestrial fire. G. Agricola, But if this were not to, because fire putrefies not; yet there is no reason we should doubt but that generation may be effected by the fire, as by the form in its proper matte. For unless there were morfane, in metals, they would not melt; what therefore should hinder nature, but that it may give this a form? Aristotle maketh the question, Whether in the sphere of the fire (which is next to the Moon) there be generated any living creatures? and he seemeth to be in doubt, and putteth of the quellion until another time; but when he affirmeth that the Fire-fly is generated in this fire of ours, I fee no reason, why any should doubt of it : yet there are some very learned men, and eminent writers of our time (who feem nevertheless to excel rather in wit, reading and language, than in the folid knowledge of things natural) who condemn and reject not only the generation of these little creatures in the fire, but this whole hittory as frivolous, false, and unworthy of a Philosopher. My readers expect now, that I answere these mens arguments.

They object that Ariffotle doth in plain terms affirm, that the fire produceth no living creature. The Philosopher doth there compare the heat of feed with the heat of fire, affirming that the e is not a fiery hear in feed; for (faith he) if there were, it would produce nothing. But this hinders not, but that a living creature may be generated in the fire without feed: but of forme other fix and convenient matter, as we shall see anon. Besides, the Philosopher seems here (as

to slamedifficultary at slamedige : then being put into an eartheil per orginis, let them be imo-Substitution and the substitution of the subst could iniqued dips; sie hath alfdibliges I dis reyers and therebroking mings sgument for some and the responsible of the state of the congeione against political production and the service of the serv likewise elsewhere) to speak of that hre only which is under the sphere of the Moon, that that produceth no living c.eature; not of ours, where there is both mixtion, and no pure fire. But they yet urge: Our tire is Substantia New Jourgestim, a substance of most subtil parts, and seizeth upon all things that are in its way, devouring them and turning them into its own fubiliance. This was answered before when we instanced in some things which are rather perfected in the fire, and which fire is by no means able to confume or turn into its substance. Ic. Langius (a man of mich reading, and a most learned Philosopher) and from him Cardane gr ints that some Animals may live in the fire, but not that they can be breat there; for in this they yeeld to the Philosophet. But who feeth not how abfurd this yeelding is? for I cannot fee how things generated in a temperate place, should be able to live in that extreme. For that which they say of the Salamander, is as good as nothing. The Salamander (as Diofe hath observed) doth not live long in the fire: for as foon as that mouture, which runneth down on every fide from its yellow spots (as I conceive) while it staies in the sire, is consumed (which is quickly done) it is presently brought to ashes, as Pennins hath made trial with our Bruerus in the Countrey about Heidelburg. Eralius a most learned Physician, disputing about rotten Feavers, endevoureth to overthrow all this his ftory with these arguments. First, because Aristotle compileth the History (faith Erastus) who. it is confelled, writ many things from hearfay; I grant it: but then he adds, 'ut ainnt, as it is reported, or some other word of the same importance (as Niphus hath well-observed) even as in that very place, speaking of the Salamander, he addeth, of pann. We may observe that this is the constant practice of the Philosopher, when he speaks according to the opinion, or from the relarion of others; but grant it were so, that he from others related it; they were deceived (faith Erafins) who related it to him; imagining those creatures bred in the fire, which fell by chance into it. But the circumstances of the place make it appear that this is false. If they had fallen from elsewhere into the fire, surely by his own confession they would be consumed by the fire, And unless they had been bred there, (as I said before) how should they be able to live in such an extremity of flame? Besides, spectators have observed the motion of their feet, the number of their wings, their flying, yea their death, and the cause of their death, viz. their flying somewhat too far out of the fire. These things and the like evince that those relators were not at all deceived, but that they related what was true and unquestionable. But no Author either before or fince Ariffetle affirms this, but one or other perhaps who hath transcribed it from him. This is more (Erastiu) than you know, you have not read all Authors Books: the greatest part of books is loft, asit appeareth plainly out of Atheneus, and Histories bear witness. But how I pray you, came Pliny to be affired that Fire-flies have four feet? He did not learn this from Arifforle, nor is there any fuch thing to be found in his writings which are extant. Wherefore either he learnt it from others, or elie the Hiltory was known in Pliny's time. Pliny therefore added this, that he might make up the History compleat. 'Nay, if you had road Cicero I. de Nat. Dee: you had found him affirming for certain, that there are little winged creatures bred in the middle of the fire. Neither did I before think you so ignorant in Theology, as not to know what S. Augustine (I. de Civit. Dei 21. c. 2.) hath observed of these Pyribia: There are, saith he, creatures which live in the midst of the fire; and there are found some worms at the Springhead of hot waters, whose heat no man toucheth without harm : while these remain there not only without receiving any hurt, but are not able to subsist out of them. And Vincentius hist. Nat. 1. 20. c. 68. In some waters which are naturally hot, there are certain Worms which live as well as Fishes in cold: nay if they go out of those waters into cold they die. Solinus also confirmeth it c. 17, who calleth these kinde of Flies Caryfria, and reporteth that in Crese they fly into hot furnaces without harm. Yea and Seneca (guest natural. l. 2.) affirmeth that some living creatures are generated of the fire; and therefore these Fire-flies likewise; as lately Marfilim Cognatus teacheth us in a large Discourse, Variar. observ. l. 1. c. 23, 24. Do not then any longer contend, that no Author either before or fince Aristotle affirmeth it; fince besides these pious and grave men already named, I can bring others also, who would convince you either of plain falshood, or of a levity not hard to be discerned. But Theophrastus maketh no mention of it in his Book de Igne. What do you conclude, Erastus, from thence, that the History is falle? Very fine. Perhaps he beleeved it not; is it therefore false? But it is probable. I grant it. There are many things probable, and yet falle, as experience teacheth us. Eraftus wrote many things against Paracelfu which are probable, yet not all true, unless those things which he understood not, betrue, Certainly he endevoured to confute many things, which I know he never underflood: I will not now descend to particulars. Well, but the heat of fire is not going, fit for generation. This, Erasius, you apprehend not; but I told you before, that if it were in the feed, it were not; which was the Philosophers meaning. For it is adalland, corruptive, according to Aristotle: But I answered before, that fire doth not corrupt all things. This barrenness therefore, or (if you please) destructiveness of the fire is to be limited. Nor truly do I conceive this to be done miraculously, but by the power of Nature; neither do I take it for a tale, but for a History agreeable to nature. And as for what he writeth of the Salamander, he adds as I said before: there was no need to add it. But I beseech those who believe nothing but what they fee, to tell me, Have any one of the ancients found fault with this History, or confixed it I speak of the Greek writers. No, not so much as Galen, who otherwise is a most sharp reprehender of the Philosophers, and would have laid hold on this instantly, if he had had CHAP. 26. Of lesser living Creatures.

any fuch opinion. Therefore it is likely that the history is true, because none of the old wrirers found fault with it. But come we now to Matthielm, who of all men hath contradicted this History most unhappily; for in his margent he inveigheth against the vain opinions of the Philosopher (as he thinks) where he appears in some things vainer than vanity it self. But I will return to the business. It is against (taith he) the work of nature. Is it enough for Matthiolus to fay to, though he prove nothing? If the flory had been true, Galen Would never have omitredit, who hath fearched out all things elie fo diligently, furnaces, and metals, and what not? ? ... line Scaliger will make answer, to what end should be repeat a thing known before? Sooner would be (as he was a famous and a malicious detracter) it he had not found it to, have reprehended it, as he doth in some places make it ridiculous. He which continued so few daies, did not understand the whole matter; they were not, they are not alwaies at hand, he never enquired of the Bakers. But if I should say that a little she colt newly foaled should have plenty of milk in its udder, and that it did iffue forth in great quantity, what would they fay then? yet nevertheless I faw it at London about fix years fince, as also many others of good note and credit, who with their own hands did milk it out of its teats. They will fay perhaps, we do not believe it; let then chuie, it makes not much to the matter; there are many productions of nature, the causes whereof it is impossible for any manto know, much less to shew to others. And that certainly not without great reason, that we might both admire the infinite power of God, and acknowledge our own blindness and ignorance. For these and the like did God create only for his glory, that he might both confound the shallow understandings of men, and also learn them to acquiesce in his wisdome only for so much as in searching out the natural causes of things, it is impossible to go any farther. For this is amongst the works of God that may pluck down our ambition, and makes us with all our wit to fly to that common Anchor of fools, namely hidden causes and the whole substance. What have we then to do? surely only to apply our selves unto him, from whom all wisdome, knowledge, and perfection doth proceed: for whilest we relie on our own wits, and do pty into the Majesty of God, we must needs (as Solomon in his Proveibs speaketh) be confounded by the same. What then remains? this surely, that they which think these things to be impossible, do keep their opinion to themselves, without medling with those that think the contrary.

The Author of the Geoponicks (if I am not deceived) cals this little animal a Salamander: his words are these: Zanaudroes to endouge to end to the fire; and living in the sire, we that is to say, The Salamander that little creature is begetten in the sire; and living in the sire, is not consumed by it. Here he tels three untruths together. For neither is this the least of creatures, but oftentimes bigger, sometime less, neither is it generated by the sire; nor doth it live long in the sire, as I said before, out of Dioscorides. Thus much I thought good to add, lest young students reading those Geoponicks should erre to foully with Zoroasses. For what purposes it serveth, I cannot boldly say: yet by its place of growth and principles it seement to dry and cleanse powerfully. It is also of very thin parts and body; it pierceth to places very distant: and truly if the Grashopper which seedeth upon air, be of so burning a faculty; what shall we think of the Fire-fly, which eateth and drinketh slames? But the Fire-flies are of this use to our mindes: they represent to our understanding the wonderful power of God, who hath made the greatest of all the Elements, Fire, subject to so small, so dry a creature: vouchsafing to be vanquished by these while it scornesth, I do not say to be vanquished (to use Majolan's words, Dier. Canic. Collog. 5.) but even so

much as to be touched by men, or the greater Animals.

CHAP. XXVI.

Of the Water-Spider.

The Water-Spider is next, a little creature of exceeding nimbleness, whose History Auzerthors have so slightly handled, that we can hardly pick out any thing of weight or moment towards the illustration of this History: we shall yet perform what we can.

I utterly deny "Auzer in Aristotle, to be the same with Tipula in Plantus (as Gaza interprets it)

for I am not periwaded that Mule-gnats can come of them.

It is called in Latine Tipula: Plantus, Festus, and Nonius Marcellus write it Tipul; others, The Naties Tipula; Guillerinus de Conchis reads Tapula; Albertus and Vincentius in his Speculum, call it Tappula: none of them aright. By Plantus it is called Tipula; in Greek (as I found in Gessier's papers) mich, which word truly I finde not any where any footsteps of, nor can I tell what it properly signifies; some High-Dutch call it Wasser-seins, which is to say, a Water-goat; others Wasser-spin, which is a Water-spider; the Nether-lands, Wasser-spine; with us it is called the Water-spider, as with the High-Dutch and Netherlands, for likenels sake; in Spanish, Gusano que correspora el aqua, a worm that runs upon the water; in Italian, Capra di aqua; in Polonian, Wood by cieluck,

There are two forts of Water-spiders, the greater and the less. They differ in bigness only, or pethaps in age: the greater are more common in coldest waters, the less are somewhat more blackish and of a more compact body.

Siff

The

The greater more inclines to an ash-colour, being of a larger body.

Although severall men write severally, and neither tell any certain marks whereby it may be known, nor agree in the number of its feet, yet I hope we shall so clearly and perspicuously explain the History of the Water-pider, that there will be no occasion of doubt left here-

The Description

The Water-spider is a little creature, in shape very like a Spider, of a body somewhat long and flender: it hath four feet fall to its breath, and two little armes stretched out before near its mouth, perhaps in stead of ho.ns; which if you reckon with its feet, it will have fix feet; which vet (so far as we could observe) it useth not when it runnerh: they are as short again as the rest of its feet, neither have they any knots or joynts like the other feet. Therefore Albertus and others allow but four feet to the Water-spider: but Festus ix, reckoning these little armes together with its feet. It hath four wings, very feeble ones, which feem not to be made for flying, but for leaping. They are sho ter than its body, and the uppermost of them a little thicker and larger than the others, but yet not of leather (like those shearthy cases) they are between a brazen colour and a black; the inner wings are lester and rhinner, and of a filver colour. Whether they Av by night like Water-beetles or no, we are uncertain; they leap sometimes upon the water fo lightly, that they scarce so much as stir the surface of it. Hence grew that prove b among the Ancients, Lighter than a Water spider. So Pierius being to express the lightness of men; and Virgil, the nimbleness of Camilla, compare them to the Water spider. Plantus likewite in his Perfa, Neg. Tipula levim of pondus quam sides lenonia (for so Lambine reads it, against the consent of all copies, even that of Nonius) A Panders honesty is lighter than a Water-spider: It runneth not in a continued course, but with intermission. It goeth not under water, but when it is driven thither by force: its body is never wet. They are found all the Summer time in standing waters and ponds which are free from the wind, and quiet : formetimes also they are met with in rivers, especially close by the banks of great rivers, and for the most part under the shades of trees (as of the willow, or any other tree, (which is not over tall): most commonly multitudes of them are together in companies. They are feen fometimes to couple leaping on one anothers backs, but they make an end of engendring very quickly. One shall hardly finde any one of them in Winter.

Their Ule.

Whether they be of any use in Physick, besides the common use Flies are of, we leave for others to make experiment: for we know of none; nevertheless we utterly deny that these little creatures were brought forth by nature to no purpose. Gertainly the Gudgeon, the Rochet, the Pearch, and other inhabitants in the dominions of the waters do infficiently declare how useful they are for the feeding and fatning of Fishes. Without question Fishes, Nonim, Marcellus, Sipontinus, and others, meant this Water-spider now described, as it will appear by their words. The Tipula (faith Feltus) is a kinde of little creature, having fix feet, but so light, that in funning upon the water it seemeth to take no steps. Perities faith upon the matter the same. The Tipula (saith Nonius Marcellus) is a very light creature, which doch not swim but go upon the water. Vario thus: Levis Tipula levissime frigidos transis lacus: for so the place which is corrupted, is to be read and corrected: The light Water-spider very nimbly passeth over the cold ponds. Albertus Guillerinus de Conchis, and Vincentius call it Araneus Aquaticus, interpreting the Dutch name (for it hath some likeness with the Spider) ascribing but four seet to the Tipula, not reckoning the little arms which are before, among its feet, fince it doth not use them in going. Others (as I said before) reckoning those little arms among their seet do allow Water-spiders six seet. Hence it does most certainly appear, that we have described that very Tipula which Plantus mentions, so that there is no room left for any ones doubting he eafter. But before we go any further, the truth requires of me, that I confure two notorious errors of Guillerinus de Conchis. The first error is, when he faith that the Water-spider lives alike upon the water and upon the land; the other, when he faith, that it runneth very swiftly upon land; both which do evidently contradict experience: for upon land it doth not live long, nor run at all, but move with a very flow pace, and iometimes leap, but that very

Whether Catrab in Avicen, which is called by Silvaticus, Cutubut and Eckentubut, be the Water-spider (as Wierus thinketh) I cannot say for certain; although indeed I am easily perswaded by reason of the circumstances, to believe that Catrab in Avicen is not the Water-spider. But let us hear Avicens description: Catrab (saith Avicen) is a little creature having its being on the surface of the water, which moveth upon it divers wates without order, and diveth ever and anon to the bottome, and presently appeareth above again. Sylvations hath almost the same word for word: only he adds, that whenfoever any thing happens amifs to it, it runs away, and by and by appears again. From this little creature by reason of its restless and disordered motion, hither and thither, that kinde of melancholy which the Greeks call aversports, the Latines Infania Lupina, is called by Avicen, Cathrab and Alcathrab; with which when men are taken, they fly from the living, and go out by night, and frequent graves (as Paulus writes) and think indeed that they are turned into Wolves, as mierre writes it befell a certain husbandman in Germany in the year 1541. The Ancients (faith Wierns) call a fly which is common in moorille grounds, Tipula. And we think Manardus made mention of this somewhere in his Epittles. Wherefore I am fully perswaded that Currab is not this Water-spider, but some other little

creature, the least of the kinde of Water-beetles, which with a restless motion moveth almost continually upon the surface of the water hither and thither without order (as we said in the Hiflory of them) and upon the least disturbance or stirring of the water, goeth to the bottome, and nevertly hideth it felf in the mud, but by and by alloon as the billowes are down, rifeth up again to the surface of the water. This little creature is seldome single, but many of them sport together in the same place, running up and down several waies. I was once wont to behold with great delight these little very black and shining Beetles pulling one another, and as it were wrefling together. But of these we have spoken at large among the Water-beetles.. And we thall take Gaza's Tipulæ into our consideration among the Water-worms,

The word Afcaris which they interpret Tipula, maketh nothing toward the illustration of this

History.

CHAP. XXVII.

Of the Forficula, or Earwig.

Rnoldus his Forficula, is called by the later Latine writers, Auricularia; by the more Ant The Name. A cient, Mordella: Niphus cals it Vellicula à vellicando, from rending; the French call the Earwig Aureilliez, or Perceaureille; the Germans, Oren-worm; the Low Dutch Orenmetel; the English, Earwig. Hadrianus Junius thinks it to be Fullo, which notwithstanding much differs from the form of a Beetle. Is this the Greeks problem? truly both the original of it and the biting agree thereunto; for this is bred also in the hollow stalks of herbs, (as of the wilder Parfilip, Angelica, Fennel Gigant) and is frequently feen in Coleworts. The Northern English by an obscene name call it Twich-ballock, as if you would call it Scrotomordium, or igesda'xono, for where ever it findes a rivled pleated skin, it will cause very great pain, either by biting with the mouth, or by winding about it with its forked tail; which Penniss faith once biring with the hound of which we fell upon two forts of Earwigs, both were with wings, contrary to the opinion of many. For if you force them here and there back again with a bull-rulls. The difference when they are hem'd in in some place or upon a table, (which the most illustrious Knives taught and description Pennius) they will presently open their wings that are hid under their covers, and fly away. But on. you must take diligent heed that you press it not too hard with a straw or or rush, or wound it. for then if it would never so sain it cannot fly away. The more common is seen with a light red colour; his foreyards, seet, and forked tail are yellow. The other (which

is more rare in England, and was seen by me but once or twice) is greater than the former, and of a blacker body, hath a filver ring about the neck to adorn it: the outward covers of the wings are of a reddiffi colour: the mouth is forked and yellow; on the back on both fides near the fides, there arise five yellowish spots, the fork of the tail is short and black, and she lifts this toward her head and flies, being angry, into the air.

"They are oft found in Coleworts and hollow Reeds, and in the little bladders of Elm leaves. They breed of worms that breed in the stalks: they yearly cast their old skin, and that being gone they look white as snow. But with age it growes again, and is died with its ancient colour. The English women hate them exceedingly, because of the flowers of Clove-gellishowers that

they eat and spoyl, and they lay snares for them thus: They set in the utmost void places Ox-hoofs, Hogs-hoofs, or old cast things that are hollow, upon a staff fastned to the ground, and these are easily stuft with cloathes or straw; and when by night the earwigs creep into these to avoid the rain or to hide themselves, in the morning these old cast things being suddenly taken away and shook forth, a great multitude of them fals out, and are killed with treading upon them. Arneldus Breviar. I. cap. 25. bids us to boyl them in common oyl, or oyl of Hearts-ease, and Their UR: with that to amoint the arteries of such as are in a Convulsion, both their temples and wrists, to cause a Feaver, which is a remedy for a Convulsion. Josephu Michaelis, an Italian and a famous Phylician, is wont to collect a great number of them, and to bring them to a fine powder in Balneo in a glass very close stopt. Then he mingles as much powder with Hares pisse, that he may pour into the ear morning and evening. He often protested to Penniss that this was a secret to cure deafness. Others mingle the powder with oyl of Cloves and use it as before. The smaller Gallinago, (which the English call a Suite) and Hens feed on Earwigs: and I well remember that I have found a great number of them in their Mawes;

CHAP. XXVIII.

Of the Scorpion, the Ant, and flying Lice.

1024

Ristorie 4. de partib. c. 6. denieth that Scorpions have wings, Scorpions (faith he) move A not flying, but going. But latter ages since him have seen and acknowledged some of them to be winged. Apollodorus (witness Pliny) relateth that some of them for certain have wings, which Nicander also hath recorded. Panjanins in Baoric. speaking of winged Serpents hath these words: Neither ought any one to be too forward to believe those things, which Nature more rarely representeth; nor yet to be altogether incredulous concerning them. I never faw any where flying Serpents, yet am I easily perswaded to believe that there are fuch, because a man of Phrygia lately prought into Jona a winged Scorpion of the Locults kinde. Paramenes also I. de Best. Venenatio in Egypt. reporteth that he saw, not with other mens eyes, but with his own eyes, Scorpions with wings, and armed with a double sting in their tail. With whom Elian agreeth 1. 16. c. 42, 43. Megasthenes hath recorded that there are some in India among the Prasis, which have wings, and are implantable united that there ding great ones. In Africk likewise there are some winged, and others without wings; having seven joynts in their tails, saith Strabo l. 15. Geogr. & l. 17. The Pfylli (saith Pliny 1. 11.6. 25.) have often endeyoured to bring them over into Italy, but they were not able to live beyond the climate of Sicily: yet there are feen of them fometimes in Italy but harmless ones, and in many other places, as about Pharus in Agypt. We read allo in the History of Navigations, that Jambolus the Portugal, while he stayed at Palimbrota (it is a City situate by Ganges towards the East, and according to Diodorus Siculus built of old by Hercules) faw there great flore of winged Scorpions. It might be called in Latine, Nepales quass Nepa alata, for so Planens cals the Scorpion in Casina, when he saith, Recessim cedam ad parietem; imitabor nepam. So again Cicero 5, de Finib. Nepa acuseo uni videas. Varro also and Columella do very often call the Scorpion by that name, although Festus understand by it a crab. Nonnius writeth that that name was borrowed from the Moors, by whom Scorpions were first called Nope, and brought into Italy. Thou feelt

here its ordinary bigness and shape; It is of a colour very like honey, whereupon it is called malxages. The last joynt of the rail in this kinde is black, armed with a double sting, as if one could not do mischief enough: it hath wings like the mandible of the Locusts, it goes obliquely and after the manner of a Crab; it is very huntfull to men, especially to young men and boyes. Alian addibutes to it a glittering red colour, and calleth it flame-colour. Its poylon being hor, causeth extream heat; which happeneth on evident in the

Scorpions which have no wings. It kits Lizards, Adder's Spiders, Whirls, and all kinde of Serpents, Alian. 1. 8. c. 13. This kinde of Scorpion between being applyed to a wound made by it felt, healeth it, as others do: and if the fell of one of them burnt come to other Scorpions, it driveth them out of a house.

Its Generation is after the same manner with theirs that have no wings, of which we shall treat at large in the second Book.

The Ant is called by the Latines Formica à ferendis micus, from carrying grains of com, faith Isdors. The Greeks call it wifund, whenever, without, Boguara, Splane, and objustives, by Heffchim and Various; it is called in Hebrew, 752; in French, Fourmis; in English, Ant, Emmet, Pifmire; in Spanish, Hormiga; in Italian, Formica; in the Sclavonian and Polonian Tongues Mrameners; in the Illyrian, Mponka; in Low Dutch, Miere; in Flandrian, Labness; it Dutch, Omays, Omnes, Eims. Now some Ants are winged, some without wings. One of the Greeks call those that are winged (of which only we treat in this Book) suppas another cals them offers they are named by Aristotle lampulanus, and smply lamils, 1. 1. de Anim. part. by the Latines Equites, because of their exceeding swiftness, wherein they excel the others.) They are of a larger body and bigger limbs than those that go and have no wings, (whereupon Pling, if I mistake not, call'd rhem Herculane) and of a middle colour between black and swart: they have four filver coloured wings; their uppermost bigger and longer than their whole body; their inner wings half so big. I have nothing that I write for certain, concerning these Indian flying Ants. For Authors themselves are uncertain, and many late writers, having travelled over almost all India on soot, have yet found none of those gold-horders and devourers of flesh; Of which Megasthenes hath recorded thus much: There are found (faith he) among the Darda certain winged Ants no less than Foxes: Now the gold-stealers understanding that they feed upon the flesh of wilde beasts, strew pieces of it along the waies, and so while the Ants are overbusic about their meat, they take away without danger all the gold they had all this while stolen. Onesicritus writeth that he saw some of their skins like Panthers skins. The Book entitled De Natura rerum, so describes this winged creature, with hooked clawes, a winged

body, and a crooked beak, that one would take it for a Griffin rather than an Ant. That body, and a crossed fuch, we read in *Philoftratus*, who placeth Ants and Griffins also in India; which are not very like one another in shape, but both truly keepers and diggers up of gold. The horns of the Indian Ant, fet up in the Temple of Herenles at Erythra, were a wonder, as Pliny witnesseth, or rather lieth. He that desireth more dreams concerning them, let hintead Herodotus, Arrianus, Tzeszes, Strabo, Elian, and Pliny, who gave so much credit to lies carried to and fro and entertained, that they were not ashamed to put them down even for truths. But passing over the Indian Ants, let us treat of those in Europe only; whole course of life, fights, victories, policies, prudence, sagacity, parsimony, cumning, ly; whose country, and laboriousness I would to The medicifrigality, industry, are the firme of men represent here; but that it would be necessary to repeat the same things nal use. in the fecond Book, when we shall treat of those that go, with which they agree in na-The way t rute, and belong to the same Common-wealth. With these Herculean Ants bruised, and make the Ovt salt and Pepper put to them, the Manginess, the Leprosie, and the Scurfe are cured. Plin. is found in Oyl made of winged Ants, provoketh and strengtheneth Venus. Wecker. To conclude, what-Barthol. Monfoever diseases other Ants are good for (and they help very many, as you shall read) the winged tag. 1,5.11aff. ones have the same or greater vertue in curing of them.

Agatharsides tels us, that the Acridophagi or eaters of Locusts are not far distant from the inhabitants of the Red sea: which nation are of a lower stature than others, lean of visage, and extream black. About the Vernal Æquinoctial, when the South-well and Well winds blow with the Italians, an unspeakable multitude of great Locusts is brought to them with those winds, out of some place unknown, which differ little from birds in their faculty of flying, but in the shape of their body very much. With this fort of creatures they are nourifled all this feafon, feeding upon them falted or otherwaies dreft. And they catch them by setching them down from the air to the ground with a smoak. And these people are reported to excel in nimbleness and swiftness of foot: but taking a very dry nutriment, they do not prolong their life beyond forty years, may and dye more miserably than they lived: for when old age drawes nigh, there breed in their bodies certain forts of flying Lice, in figure indeed like Dog-flies, but otherwise less; they begin at the breast and the belly, and in a thort space eat up all the skin of their face. Others of them are taken like those which have the Irch, thereupon they tear themselves grievously, and at length the disease being at a flay, and thin humours running at the coming out of these little creatures, they are fain poor wretches to undergo intolerable torments: and so by reason either of ill humors, or of their feeding, or of the badness of the air, they die. Hieron. Mercurial. de morb. cas. ex Diodoro Siculo 4. Antiq. lib.

CHAP. XXIX.

Of the winged Punie or Wall-Loufe.

7 Hen I had resolved to conclude this History of winged Insects, we had three wood Wall-lice of the sheath-winged kinde brought to us, which we here represent upon

CH A.P. 29.

their backs, and upon their bellies. The back, the neck, the little hornes, and the sheathy cases of the first are of the colour of a Leek; its wings which are longer than its sheathy cases, are between green and yellow, as also its eyes and feet. The second is of a swart colour all over. The third hath its body variously coloured with black and red; its little horns and feet coal-black: all of them do glitter here and there with a golden brightness (which Pennius observed not) and seem to be of a very compact and tender body. They are found fitting most commonly upon Mallowes, sometimes upon other plants and trees that bear Apples like Pine-apples, as likewise upon the Elmand the Willow. They copulate in the moneth of May tail to tail, and are almost a whole day about it. The male is less, the female bigger and broader. They fly in the heat of the day fast enough, but neither long nor far. There are bred with us (faith Cardane) in the grass two Animals like Wall-lice, the one in smell but not in shape; the other in shape but not in smell: but neither of them is of the species of Wall-lice, because they both sly. lib. de variet. rer. But he that shall observe their shink and outward shape of body, will not turn them out of the family of the Wall-lice, for their wings sake: although indeed the field kindes are six times as big as those in houses. Jacobus Quickelbergius sent two other kindes of them to Pennius from the parts about Vienna, which were waved with a golden and black colour. Matthiolus not at all understanding S (((3

Pliny, denieth that they have any vertue in them. But Pliny many waies commendeth the garden Wall-lice, being reduced to ashes and infused in oyl of Roses, against pains of the Their Medici- ears. Palladius useth these with the Lees of Oyl, an Oxe Gall, Ivy-leaves and Oyl, for an overthent for the bitings of venomous Horseeches. Let the head of the yard be put into Oyl of Camomil pretty hot, in which Wall-lice have boyled; then let the head of the vard when it is taken out of the oyl, be anointed with pounded Garlick, and the patient will certainly make water. Arnoldus de villa nova l. 2. Breviaris, c. de stranguria & dysmia. Are not these to be taken for those Wall-lice, which the Dutch call Knolster and Qualfers? And hitherto hath been faid what we know of winged Infects: ye Pivterus's, Camerarius's, Clusius's, Quickelbergius's, and ye later and more laborious sons of Esculapius (whom Pheebus moulded out of richer clay) if you have any thing which is here wanting, make addiction of it, according to your wonted courtese and ingenuity, remembring that of the old Poet:

Kal मि तो, में Adhe र्त विक्रीनगढ़ वो Musie Sugai.

When you receive, you ought to give withall: The Muses gates are wide, and liberall.

Of the Division of the Second Book.

The Preface.

Y the clew of Dadalus we are at last got out of the Camps of winged horsemen; where should I relate with how many stings the Infects of the lower ranks have assaulted me, how much they have troubled my brain, my right hand, my eyes, whilest I accurately diffected and observed all their parts, truly I should either faint in rehearling the wounds, or what I was resolved in my minde to finish, I should not be able to do. Wherefore, what valiant souldiers are wont to do, whilest the wound is yet fresh and hot, we will break forth into both Armies, and with better undertakings, so far as may be, strive to overcome them. Thou O great God, who in the Inventory of these smallest Creatures, makest the most excellent understandings to stand amazed and stupid; give me strength, that as by thy goodness I have mustered those Insects that fly, by the same I may be enabled to draw forth all those Foot-forces that want wings; so that in all my labour, I may seem to have no other end than to feek thy glory, to advance learning, and nothing that concerns my own particular, but that I may finde thee in these thy works. Go to therefore bold Atheist, who art ignorant of God and the Divine Perfection: endure, if thou canst, the biting of the Spider Phalangium, or of the Scorpion; abide the pain of the Worm Scolependra; swallow down the Pine-tree Catterpiller, contend with Worms, despise with Herod, biting Lice, so much as thou art able, at last thou shalt finde that there is no foot Souldier so mean in this Army, that will not quickly overcome all the forces of thy body and minde, and will make thy foul mouth to confess, by their ministry, that there is a God. Thus then I draw forth my Regiments, so I muster the Souldiers.

These goe with many feet: The Catterpillers, Beetles, and such as are called Staphlyni.

These goe with eight feet: The Socrpion, the

With fix: As Wasps, Glow-worms, the female Meloe; also Worms in woods trees, roots, fruits, meats, garments, chambers, humors.

Some without Feet: As Oripa, Maw-worms, Earth worms.

All Infects without wings are either belonging to the

Earth

Water

Some swim with six feet: as the Shrimp, the Lake Scorpion, the Nosonestus.

(With Feet,

With many feet? as the Sea Scolopendra, the many footed Shrimp.

Without Feet: As the Horseeth, the Hair-worm.

THEATER OF INSECT

Of lesser living Creatures.
BOOK II.

CHAP. I.

Concerning Catterpillers and their several kindes, and namely of Silk-spinners, and Silk-worms.

EE thought fit to place in the Front, Catterpillers, the devouters of Egypt: because they are most different in their kindes, and also some of The Name: them are excellent for their use and worth. It is no fond conceit to maintain that Catterpillers had their name in Latine from devouring, for they eat up leaves, boughs, flowers, fruits; which also may be observed in the Peach. Ovid called these Field-worms:

Field-worms that weave their hoary thred on boughs, we finds That they with painted Butterslies do change their kinde.

The Greeks call a Catterpiller as uno, from the waving and vaulting motion, when it creeps, whereby it lifts up and contracts it felf. The Hebrews call it Ghazam, because it sheatest the stuits of the earth, as Kimhi saith on feet the surf. The Italians call it Rugaverme, and Bruches for so saith Marcellus Virgilius upon Dioscorides. In our times, saith he, our whole Countrey cals all kindes of Catterpillers Bruchi. The Spaniards call them Oraga; the French, Chenille, Chatterpillers; the English, by the name of Catterpillers; but the Northern people call the hairy Catterpillers Oubsurs; the Southern call them Palmer-worms; in the Poles language, a Catterpiller is called Rup hausenka; in the German Tongue Ein Raup; in Low Dutch, Ruype; in Sclavonish Gassenca; the Peilants call them Certrin, and Cedebroa.

Ishould be endlets if I should add all kindes of Catterpillers; for some seef rough, others The disterential; some have horns, (and that either in their head or in their tail); some are without horns; cerestone have many feet, some sewer, but none have above sixteen feet. Most of them move swiftly in a waving posture; yet others there are that go even and slowly. Some do yearly change their old skin, and others do not. Some are changed into Aurelia's fixed above the earth, whence are bred your ordinary Butterslies, others are transformed under the earth, and become Glow-worms. Also some of their Aurelia's are smooth and equal; some again are hairy and wrinkled, pointed at the ends, sharp; some (namely of the harder kinde) naked, but others (namely of the tenderest) are covered with moss or silken down. The most of them are bred of the eggs of Butter-slies, and are changed into Aurelia's: some are bred on the leaves of trees, of the proper seed left there in the web in Aurumn; or of the dew or air shut up in it, and corrupting there, as Vine-fretters. Some again seed on leaves, some on showers, and some on snuits. We, to express both kindes of Catterpillers, shall divide them into those that are bred from other things; and those that are bred from their own kinde alone. Such as are bred from other things, again, are either smooth or hairy; as also those are that proceed from their own kindes. Amongst the smooth Catterpillers, the Silkworm deservedly challengeth the sinft place.

Edward Morie nun Berefish, lib. 5.

1030

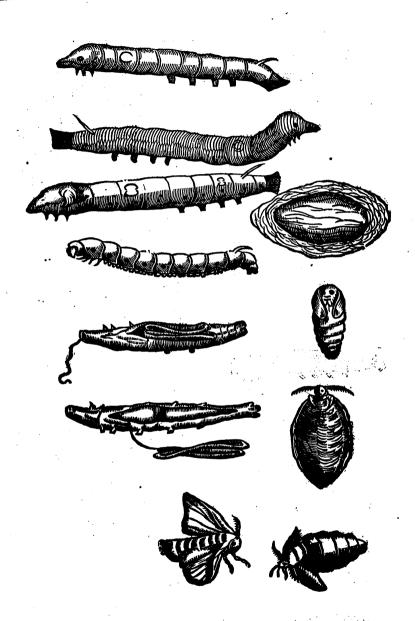

A therm that to a Fly transformed its and their. I ransformed back, once mere is made a ribin agen; I mice it buth dies and lives anew, is wasted ore by Chaucht thice unto the Elizian shore.

Its successor left half living and half dead, which after spins silk robes for those are sinely bredies for the after spins silk norm makes why deth she labout thus? It is not for her self she labours out for us. Her sleece was formerly an ornament for Kings, But who prodigious age consustences. So prodigal of silks, that the vile rabble, clowns, Onster-wives, herbewomen, which is silk suits and gowns: Nething hope common joing of all then silk attire, which wastes and burns mens hearts with continual fire.

In which words, though our divine Poet, who was more clear than the ancient Bards, doth fomething touch upon the Silk-worms, and paint them forth, yet he doth not describe them to fully, that it may fuffice for the History of them. For Silk-worms are smooth Catterpillers almost of a milky colour, with small black eyes, and as you see, with a so ked mouth. The frow white ones are bred of Butterslies eggs, which growing by degrees into little worms, produce Silk-worms of the same colour with Butterslies. And that I may not repeat this again, let it stiffice that I have once said it; the Butterfly is almost always of the same colour with its Catterpillar. That Butterfly for faking its Aurelia, as many, eggs as it leaves, or feeds (it you will) like to eggs, they become so many Silk-worms afterwards; which, it you che ish them, when they are fostered by the Suns hear, and full fed with Mulberry leaves, they will repay a seward worth your cost and cate, namely a filken sleece. They breed first in Man, in which moneth and the two following moneths, they devour a multitude of leaves, and in eating as ic were by fucking they harden: when they are grown up with plenty of nourilhment, being become able, they fpin a most fine web out of themselves, like to a Spiders web. Then against cold weather, they grow rough with hair, and make themselves new thick coats for Winter, by the sharpness of their clawes, pulling the down of their skins into fleeces; then they thicken and close it, carding it with their feet; then they draw it out amongst the boughs, and make it small as with a comb: lastly they take hold of this web, and wrap their body in it, making a round nest. Then men take them, and put them in earthen vessels, and feed them with bran, and so there spring up seathers of their kinde; which, so soon as they are prepared with, they are let to perform other tasks. But the spinning work they began, growes pliable by moistures and is spun into threds on a smal spindle. Some women do use to draw it forth into yam, and then they weave it. Pathphila the daughter of Latons was the first that was reported to have woven in the Island of Co. Also Pliny reports that Silk-worms are bred in that Island, Plin. lib. 11. cap. 23. the flawers of the Cypress, Turpentine, Ash, Oake-trees, being beaten down to the ground by showres, whence they receive life. Though women were the first inventors of this Art, yet men are not ashamed to wear these garments for lightness in Summer. The customes of men are so far degenerate from Arms, that their very cloathes are grown butthenfome. The thinner and fofter the leaves are they feed upon, the finer Silk thefe Silk-worms make: wherefore amongst the people of Seres in Scythia, the most soft garments are made; which we call filken, as Marcellinus witnesseth, lib. Hift. 23. In India also and in Agypt there is great plenty and use of them, and are brought from thence to the Spaniards and Italians, being the greatest cause of wantonness amongst mortals. So often as I consider, that some ten thoufands of Silk-worms labouring continually night and day, can hardly make three ounces of Silk, so often do I condemn the excessive profution and luxuriousness of men in such costly things who defile with dirt, Silks and Velvets, that were formerly the ornaments of Kings, and make no more reckoning of them now, than of an old tattered cloak, as if they were assamed to esteem better of an honourable thing than of a base, and were wholly bent upon waste. The Greeks call this Catterpiller one, and Bombye, which name is become Latine. The Italians call it Bigatto; the Spaniards, Gnafano della feda; the French, Ver à Soge; the Germans, Ein Seyde worme; the English Silk-worm. Amongst whom a Silken habit is so much loved and valued, that they despise their own Wool, (which compared with Silk, is not contemptible, and is the most profitable and the greatest merchandise of the Kingdome.) But time will make them forgoe this wantonness, when they shall observe that their moneys are treasured up in Italy at that time, when they shall in need of it for their private or publick affine. This is a large with the state of t fairs. This is a pleasant thing and worthy to be noted, that the head of the Silk-worm, makes the tail of the Butterfly in that golden coloured Metamorphofis, and the tail the head; which also happeneth in all other Catterpillars that are changed into an Aurelia.

The Name.

Of the rest of the smooth Catterpillers.

LL the other smooth Catterpillers, are either green or yellow, or reddish, or dark, or va-A rious colours. The chief Catterpiller of the green, is that which hangs upon the Priver.

a circle furrounds the face of it, and all its feet; and it hath a horn turned backwards in the tail. They are black and red, spots are made athwart their sides, they are half purple, half white; the small spots are red, but their whole body appears green. That upon the Elder-tree differs not much from it, but that it is altogether green, except those overthwart spots very white, and some little points like milk. It chiefly feeds on the reddish coloured El-

The third, that is all green, when Autumn comes is transformed into a blackish case: it feeds on the foster Por-heibs, especially on Lettice, whence we call it the Lettice Catterpiller.

The fourth upon the Medlar-tree is less, all over green, drawing it self into an ash-coloured case, all besprinkled with most black spots.

The fifth is least of all, spins its threds on trees, (especially upon the Oake, and descends by them upon the heads of those that pass along, and intangles their hats and cloathes: a very little creature, most noted in Summer, and obvious every where, when the fall of the loaf is at hand; he wraps himself in a course web, and being shut up in a red and green cover, he dieth in Winter. He hath but ten feet, as all the rest that went before had.

1032

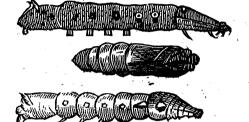

We call them yellowish, that are most part yellow: such these figures present you with, which is kept, wheresoever they are void of black, overcast that with a paler yellow, and you have their figures painted. They live on foster leaves, especially on the Tiel-tree.

Of lester living Greatices \ CHAP. O.

Vinula is next in order; which is a most delicate Catterpiller, and beautiful beyond belief, we Vinula. have found it on the Willow feeding greedily, the lips and mouth of it are a pale yellow, the eyes are fiery, the forehead is purple, the feet and the lower body green, the tail is forked, blacker than grapes, the whole body is spotted as with thick and dark red wine, which passing from the neck crossway to the very tail, a most white line doth wonderfully adorn it.

The Catterpiller called Porcellus, Dark 3. is black, brown, especially the great ter, but the lesser hath the circles white. Frequently they are found on the leaves of meadow Trifolie, and they devour them with wonderfull (wiftness.

Three various colours are chiefly observed; the Various es first hath a blewish face, and very black eyes, the lowred 10. outwardskin of the back is grayish, much besprinkled with black and yellow spots ; it is changed into an Aurelia of a bright bay garnished with a white small membrane: it loveth Cabbidge and all kinde of Turneps.

The second hath the head and feet and tail very black, being chaquered with yellow; the chequerings that are painted on them inwardly, are di-Ringuished by channels black and gray, drawn longwaies by turns. It loveth Fennel, and Annifeed, and

A The third is green from white, buncht as it goeth along, for it hath only fix feet on both fides, as those before. It is changed into an Aurelia set with pricks, of a dark colour. It confumes Olives.

The fourth feeds on Dragon-wort, and refembles asported Vipers it goes alwaies with the head upright, and leans chiefly on its breast, It loves Bulrushes, and plants that bear down, and are bred in

If you paint the ribs descending of the fifth kinds with old Miniam, there will be few things in the ploture that shall not agree with the truth,

In the fixth what you fee white, paint with Ocre-Both of them delight in the black Poplar-trees and feed greedily on it.

Tett

The chamferings bred in the feventh, must be white from yellow; all the rest of the body is of a dark colour, and changeth it self into an Aurelia, of a light red colour.

The eighth feems of the colour of ashes, waving out of black: it makes a case between black and a bright red, whence growes a dufty coloured Glow-worm.

The ninth is various, and deferredly thought fo: the roundles of the incifions are green; the horn of the tail is bent backwards, and is of a bright blew; under which a red coloured fpot ferves to make it beautiful: the middle part of the incifions is as a flest colour. Lastly, an Aurelia is included of a murry colour. We found this in the high way; it delights in the field Crowfoot.

The tenth is gray and black; for what is here white, lay gray upon it, and it will represent the creature. It is changed into a fpiral case, of a weak blew colour; the roundles being somewhat red; and it comes next to the form of a horn fashion periwinkle.

The smooth Catterpiller comes from the wilde night-shade (which the Italians call Bullandonna) of a green and yellow colour, it hath a horn in the forehead as long as ones singer, which Cardanus relates that he saw often.

CHAP. III.

Of Catterpillers rough and hairy.

Those with hairs are the most mischievous of all: some are very thick of hair, others thinner; whereof I here afford you the kindes. Amongst those of the thick hair, are walkers up and down, such as are upon Nut-tree leaves, Pine-trees; such as hair layer and are called Neufria, Pear-eaters; such as are upon Nettles, Cabbage, Hedges, freeers on Poplar, such as lose their skins, such as are amongst Marigolds, black and green, but Those that have thinner hairs are Echini, dwellers amongst Fennel, eaters of bushes, half while: of which we shall speak in order.

Pityocampers that is, Catterpillers on the Pitch and Pine trees, are as thick assignmans little finger, and as long as the breadth of three fingers. They have eleven incisions between their heads and tails, and they have fixten feet like the raft, namely about the head on both sides three, on the middle of their bodies on both sides four, and at the ends of their tails on both sides one: but the first are crooked and simil, wherewith they try, their way, the rest are broader and jagged like the first are crooked and simil, wherewith they try their way, the rest are broader and jagged like formers, that they may slick the laster to the boughs. The head is like an aneate it like common saves, that they are rough with hair and encompassed on all sides with straight bristles: the Catterpillers; they are rough with hair and encompassed on all sides with straight bristles: the hairs bred on their sides are white, they shape on their backs; the middle encompassed in the rest of the bristles being shaved off, there is a black attain an earth, their hairs very slender, yet they prick more shappy than a nettle, and cause very great pain, heat, a hairs very slender, yet they prick more shappy than a nettle, and cause very great pain, heat, a shape very pricking, unquietness. For the poyson enters suddenly without any same of the wound, and is carryed to the parts next the bowels. They spin sine webs like to Spiders, driving and disposing their threds with their fore-feet. Yowards night they go under these, as they were disposing their threds with their fore-feet. Yowards night they go under these, as they were

tents, that they may escape the inconveniencies of cold and storms. The matter of this tent is fo fatt and fine, that it is not in danger by the greatest winds, nor is it sob'd with rain: and it is to foacious, that a thousand Catterpillers may be under it. They make their nests in the small boughs of the Pine and Pitch trees, where they live not folitary as others do, but by flocks: which way so ever they bend their course, they spin and carry their thred for the web along with them; and at break of day, if it be but fair weather, the great ones accompany the lefter by troops, and having made the trees void of leaves, for they confirme them all, they labour hard in weaving. Only these plagues of the Pine and Pitch trees do not meddle with other Cone Apple trees. In Mount Athers, the woods of Trent, and in the vallies beyond the Alps they abound very much, by reason of plenty of leaves for their nourishment, as Matthiolus Witnesseth. They are truly most venomous creatures, whether you touch them outwardly with your hands, or they be given inwardly. They were of old esteemed so certainly to be poyson, that Olpian interpreting the Cornelian Law concerning private murderers, fet down amongst them to be punished ting the Cornelian Law Concerning private inducers, for additional and grade after the paint of a those that give a Pine Catterpiller to drink. Sett. Alium. ff. add and grade a Pine Catter fivallowed a Pine Catterpiller, the pain grievously afflicts both the mouth and palac; the tongue, piller dank belly and flomach are greatly inflamed by the corroding poylon: also a wonderful pain vexeth and the cure. them, though at first they seemed only to feel a pleasant kinde of tickling: great heat followeth, loathing of meat, and a perpetual desire to vomit, but ineffectual. At length if it be not helpedsthey burn the body, and make the stomach crusty almost like to Arsenick. Diese. Actim, Plin. Cell. Gal. alfo 11. simple c. 5. and Avic. fof. cap. 25. Hence it is that Actius and Egineta held it dangerous to fet the table for meat under the Pine-tree, or for to stay there, lest perhaps by the reak of the meat or vapour of the broth, or by noise of men, these Pine Catterpillers should be moved and fall down upon the meat, or should let fall their seeds, that are as deadly as themselves. They that are hurt by these must use the remedies against Cantharides, for the same means will cure them: but properly oyl made of Quinces, called melinum, and oyl Olive, is to be drank twice or thrice to cause vomit, as Dioscorides from Actius hath prescribed. They are bred, or rather regenerated, as Vine-fretters are, from Autumnal feed left in the web in certain bladders, or from the Vine-fretters themselves corrupted, as Scaliger thought.

Now we proceed to walkers about. We call those walkers, who have no certain houses or food: wherefore they do something superfittions wander like pilgrims, and like to Mice, they alwaies feed on others meat, wherefore the English call them Palmer worms, namely for their wandring life, for they dwell no where, though by reason of their hair they are called Bearworms. They will not be tied to any kinde of flowers or leaves, but they pass on boldly, and

tafte of all plants and trees, and feed where they please.

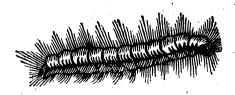

First those white spots which we see in their sides, must be such really; the whole body is black, all the inward hairs must be somewhat yellow, but all the uppermost on the back must be hoary, except those three ranks that are bred in the neck near the head, for they have the same colour with the hairs of the belly. Out of the Aurelia of this comes forth the Buttersly which you see here: whose colour, sigure, and nature, we de-

The fecond, if you make the neck and belly, and the hair there growing, yellow, you need do no more. The cover of it feems dusky, the eggs are pale. We explained the Butterfly that growes from thence in the former Book,

scribed in the Book before.

The third is the whole body and hair, dusky yellow, but that the spore on each side being obliquely made in each spicison lie hid and the head being of a light red is adorned with a certain white fork.

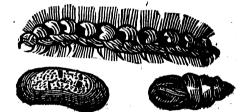

The

The fourth hath his belly and lower hairs dusky, the back and upper hairs are yellow from disky, a double forked line in the face refembles the colour of whey, or milk mingled with water.

The fifth hath a bright bay colour in the face, the fides of the belly hoary, a body various with small yellowish spots, and above these with black; yellow hairs come forth like small rags; they are sharp, and growing more sharp pointed from the middle: it hurs much the neighbouring herbs and the corn.

The fixth is a brown colour'd, if the incifions were not died with black and white spots here and there; the hairs are bred above and beneath, and fet after a faw fashion; they are very rough and hard, but they are of the colour of the body.

The feventh hath a black skin, yet it hath hairs fomething of a dirty colour, I use to call it the Penfill, because on both sides of the forehead, and also in the rump a soft penfil breaks forth of a crow-black colour: but those wedge fashioned eminences that you see in the back, are white as milk at the root, otherwise somewhat black.

The eighth holds forth a Mouse colour, on whose back those seven joynts resemble it.

The ninth is a firange and rare colour, far all the incisions are painted with various colour anatom mother, yet, mingled one with another, which a fiver flud dorn severally one by one.

The tenth is amongst the sports of wanton nature, not less elegant than it is rare, being streaked with black, green, blew, yellow ridges, and smooth strings; which some golden sports do wonderfully illustrate it hath very soft hair, soft an admirable and most pleafing freshness, it hath a purple cover fortified with a small metabrane.

CHAP. 3

Suppose the white incisions of the eleventh to be green as Leeks, and paint the skin and hairs half green.

The Nut-tree Catterpillar is of a pale green, except three black spots between the joynts, and that horn at the end of the back, and growing as it were on the remp, which receives a fresh rose colour. It especially its on the leaves of the Hazelmut, whence we call it Corplana. Haw two kinds of them, one was a full, the other a paler green.

The manifold delicacy of Nature shines forth in these, to which though it giveth them the face of a Moor or Agyptian, yet it affords them a garment that is of changeable colours, shining in divers works and real art; in the forehead; the hairs are khit as into knotty locks, and resemble the tail-yard: the like are found in the extremity of their backs. The skin is like the rain-bow, and shines in circles deeply died with purple, which nature hath sastned to the sides like broad shuds; the hairs bred in the skin, shine like the Sun, and dazle our eyes in a clear day.

are stand with the building

We received two Neufrie out of Normandy, the first had a face of a blew colour, and the body ridged with white red and gray streaks; the hairs are comely with a golden shining colour. The lefer rolled together, is like an Urchin; the head is cole-black, the body is variously spotted with little blew spots; the hairs accomble a Suffey little.

refemble a Saffor harre.

This corrupts the blow foots; the hairs refemble a Saffor harre.

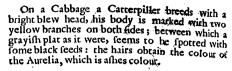

This corrupts the back of the peaturee, having a black fittinged face if the back is adorned with fome black red white ridges; in the middle as it were of the shoulders, and to the end almost of the back, little swellings or bunthes arise of black and

blew colour, fprinkled with white spots. The Eggs from whence they breed are a bright bay colour, which is also the colour of the Aurelia, and of the hair. We saw another of the same kinde, but only it had a bunch on the back.

We call that half white, which is by nature yellow from the head to half the back, and the rest white as a Lilly. The belly is yellow and associated, adomed with study, and checquered in the middle.

If you touch the feet of the Nettle Catterpiller lightly with a fading yellow, the figure will differ light from the natural? it hath hard upright hairs growing like thoms, they would with a small touch, and at first they cause a pleasant itching, but venomous; but after that a pain hard to be endured. Some maintain that it is more venomous than the Pine-tree Catterpiller.

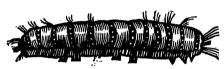

Here we shew you two hedge Catterpillers, the greater hath a face Saffron coloured, but that triangle you see in place of its note, was Lilly colonred: the body is varied with spots, white, yellow, red and black, (which we have expressed) placed in no order; it is rough with wellowith hairs: it devours the leaves of hedges and makes them naked: where at length, leaving a bottom of yam of courfer filk, the drawes her telf into a fale of a bay colour, as into a fepulchre. The leffer hath a countenance blewish, as also the whole body, except that it hath spots black and white; it hath hairs of the fame colour with the former.

These have fewer hairs: namely, Cranesbill-eater Catterpiller, St. James wors Catterpiller, Saylyard, Urchin, Bramble Catterpillers, and that little horn beaft, which the Germans well Horn-

We have here fet down exactly the form and magnitude of the Chaneshill caret, you must make the sente spore that about it flack girdles of an iron colour; and paur the felly and feet, and the winter has between the girdles, with a Leek-green amour. Comparing fent this to Pennius, with his subscription:

A great Catterpiller, feeding only on milde herbs, and is especially an enemy to Crowfoot Cranesbill in the Marishes.

The body of the Sayl-yard is various; from the head to the third incifrom, you would say he were timeened with chalks in the five following with ashy dark colour, and on the timee last with white least the tayls are made of hairs as a transmit placed together, the like sand up at the end of his back like a crest: Those four tusts on the back are made of hairs also growing in order like to teeth.

St. James wort Catterpiller, or that which eats the greater Groundfel; with the head and feet of a decayed purple colour phe belly of a pale green hath the body of an impleatant fading green and adorned with black yellow and fiery coloured spots; the colour of the hair agree with the belly.

I have observed two kindes of Urchins, one of a blewish green, the other a mingled white.

The first of the Urchin Catterpillers hath a checquered body, varied with black and yellow; the thorny briftles feem yellow, when Autumn comes it is transformed into an affry coloured Aurelia.

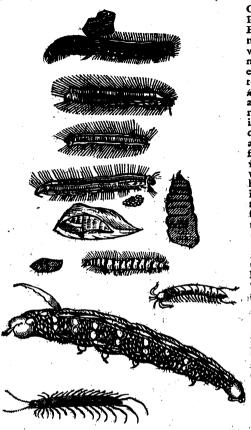

Thesecondis perfectly like an Urchin, half the back, namely the first half, is black from yellow, the latter is white from yellow, it hath pricks very there and thick, of a gravith selent.

Nature hath painted the bramble Catterpiller ashy black, on both sides with three ridges of a pale yellow colour: the hairs are very thin, and altogether black.

CHAP. 4. There is also the horn Catterpiller, who hath many green spots from yellow, the hairs bred on the middle of the back are hoary, but the horn is notched and red.

Many diversities there are of these Catterpillers upon the Mullen, Hop, Pile-wort, Bitter-sweet, Nightshade, Elder, Eini, Bafill, Tythimals, and almost every herb hath its particular deyouring Catterpiller: which that I may not prove tedious, I overpais, as well enough known. I never had the hap to fee the Hinking Catterpiller of Gefher, described by him in these words, as I have it in writing: It is, faith he, most like the horned Catterpiller, but it differs something in the horns and colour. I took one creeping on a wall at the end of August in 1550. It sends forth a filthy smell, that you would verily believe it were venomous: it was angry, and with its two forefeet it held the head alwaies upright : I think it is blinde, it was a finger long, and thick, it was rough on the back and fides, with a few hairs feattering on them; the back was black; the colour of the belly and fides was reddish from yellow: the whole body is diftingui-fied by fourteen diftinct knots: all these joynes again have a prop or wrim-kle over the back; it hath a black some-what hard head, the mouth is forked and dented, or law-fashioned; whatsomver it catcheth with these pippers, it bites it: it goes on fixteen feet, as most of the Catterpillers do, without doubt it is venomous. Vergenue thought it to be the Pine Catterpiller; others thought it was Scolopendra. But its number of feet will not let it be Scolopendra. It could fearle endure the finell while I took the description alive: it did so infeet two flowes with an extreme and intolerable flink, that I could not flay to endure it : fo fayeth Gefner.

CHAP. IV.

Of the original, breeding, nourishment, and change of Catterpillars.

Dear book, the faithfull witnesse of my pains Let not the purple and thy fair cheeks stein, writiest I in tables pains she rude worms race. And sach as change their skins into a case. For shelp by Gods wife hand created are; Which in small things is wonderful and rare, And more to be admired in Worms, than Whaless Or Elephants, Leviathan with scaleso Arm'd as with harnesses strong as stron bars, And roars like thunder terrible in wars; with drinks the fear and spenes is up agains Compar'd with worms; will be admir'd in vain.

So I shall begin with our Poet, who observed a divine power in Catterpillers from their Original; which whilest divers Authors have diversly expressed, I know not into how great dirkness they have calt us. Aristor. 5. Hist. 19. writes, that they begin from green leaves of he be, as from Cabbage, or Racish: namely by a seed like Millet left there in Autumn, whence little Worms proceed. From these Worms in three daies space Catterpillers breed at the end of the Spring; which being augmented and nourished sufficiently, they leave off moving, and at the beginning of Autumn they change their form and life for an Aurelia, Pliny faith that dew the beginning of Authorities clark upon the leaves, whence he derives all kindes of Catterpillets, to whom Arnoldus agrees: others fay they all come from Butterflies; which fo foon as they come forth of their Aurelia, they thrust forth (above or beneath the leaves hard by) some cees (the bibarous call them Turds) and these are greater or less, according to their bodies (tome of these have blew steels, some yellow, some white or black, green or red) infourteen daies they are harched by heat of the Sun, and the shell breaking, they thrust forth small Catterpillers like are harched by heat of the sun, and the men of carange they are very hunging and do nothing but very small Worms, but coloured: at first beginning they are very hunging and do nothing but devour leaves and slowers, especially of those herbs and plants, where they were left in eggs. But I should maintain that they are not bred only one way, but all these waies: for though driftoiles doctrine seems to some not acute enough, that the Cabbage little Worm grows to be a Catterpiller; yet it is not against reason; for as nature from an egg, so from a worm she prodirectly a more perfect living creature, as perfecting, not as corrupting. For though the worm he not that it was before, (as is clear to fenie) yet as much as can be perceived, it is both what it was, and is now formewhat more, for a Worm doth not dye that a Catterpiller may be bred: but adds a greater magnitude to its former body and feet, colour, wings; to life remaining, it gets other parts, and other offices: fo the off-spring of man (I use Sealigers words) after fome daies at first of a man in posse, is made a man actually; you must understand its generation in which time the intellective foul doth not yet act, but it bears the same proportion to a man that shall be, as a Worm doth to a Catterpiller or Bee. So also Pennius derided the opinion of Pliny, when he writ that Cafterpillers were bred of dew, yet all Philosophers with one confent agree, that the more imperfect small creatures are bred of dew. And not without cause. For the Sun by heating acts, being like the form, and the humour is like the matter. The Suns hear is different from the fire, for it gives life, or it preserves the souls in their likeness. For the dew hath the proportion and foftness of the air, where Theophrastus alledgeth the affect of softness (in his Book of Plants) as proper for generating air. Also nothing is more nourishing than dew, by which alone some little creatures live! which also the divine Poet said; How much doth dem lay up in the night! Therefore as it is humour, it is the matter, as it is thin, it enters, as it is drawn by the Sun, and concoded, it is the fitter for generation; for the preparation of the form carries the matter along with it, and these going together it fals out that a living creature is generated. And it is not only an off-fpring of dew, but the daughter of Butterflies, as we faid, and as experience tellifieth: and the greatest part of Catterpillers come from them, besides the Cabbage and Vinefretters, few are pred other wife, For these that the Greeks call ims, are made of dew, or a humour fluit up in webs and purrefying, especially when the wind is East, and the air warm, that hastness corruption. For then such a mighty army of them breaks forth in our Countrey, that we cannot truly fay or think to many could be bred any way but from corruption. They are all gluttonous devources of herbs and trees: whence Philip the Paralite boalls of himself in Athenaus in his Pythago Ath, for feeding on Thyme and Pot-herbs, I am a Catterpiller. Martial speaks to the same purpose, One garden will hardly seed a Catterpiller. When their time of eating is over, they wander up and sown here and there hungry, and by degrees growing lean with hunger, some within, some above the earth, seek for a fit place, where they are transformed into an Aurelia covered with a Membrane, and hanging by a threel, or into a bare case; if this happen in the midlt of Summer, after 24 daies the shell breaking, a Butte fly presently flies out: but if Autumn be well spent, the Aurelia lasts all the Winfer, and shuts out nothing till the heat of the Spring. Yet all Catterpillers are not changed into Aurelia's, but some are contracted (as Vine-frettern) and corunt, from whom off-times, three blackish eggs fall, that are the mothers of Flies or Cantharides. When your Butter flies copulate very late, they bring forth eggs (even untill the next Spring) that have life, (if you take diligent care of them) as it is usual in Silk-worms, whose eggs are fold commonly amongst the Spaniards by ounces, and pounds. Theophrastus distinguisheth the transformation of these Catterpillers rightly in these words, in his second of Plants: First, of a Catterpiller is made an Aurelia, and of this a Buttersly, then of that a Catterpiller again. But whether this Autelian Chryfallis be a living creature or not, we shall dispute when we come to speak of Insects without feet.

Of the quality and use of Catterpillers, and of their Antidotes.

LL Catterpillers have a burning quality and pilling of the skin, and raising of blifters. The A most deadly is the Pine Catterpiller, yet they are all venomous, but least of attribute that are smooth and without hair. The daughter of Calina secundus, being at Basi (saith Gesar) when CHAR. SC when the had devoured forme Cathage Catterpillers in the garden, after much vomiting, her belly swelled, the swelling troubled her many years, and no cure would be found for it. William Turntr a Divino and a keained Physician, the happy father of one Peter who was born to give physick To Physick it felf, prescribed a purging porion for a noble Woman of England, by the to Physics in the vomited up a harry Catterpiller, which being swallowed by negligence, had help whether with cruel comments: yet we may remember (faith Marcellu Virgilius) that long anneces he far of the same names, and called Catterpillers, and are far from being poyfor and amongst those menthat live by the sea side, are the last dish at their tables. We have flowed remedies against the mischievous and venomous ones before, in the Hillories of Cantharides, Bupreftis, and Pityocampes, for they admit of, and require the fame cure. If you would have your garden or trees free from them, what webs you fee hang on the naked boughs you must fiveep off in Winter; for if you let them remain till the Spring, they will breed before you can remove them. In a short space they devour all green things, and consume the flowers: some temove them. In a most spaceticy devout an green things, and continue the nowers: tome anoint their trees with the gall of a green Lizard, or of a Bull, which as it is commonly reported, they cannot endure. The Countrymen use to fishe them with some brindsone and straw set a fire under the trees. The earth dug up under the toot of the great bearing mast tree, if it be frewed in a garden, drives away Catterpillers, faith Hildegard. I should pass over the Remedy Columella hath prescribed, as a shameless delusion of Democritus, did not Pliny and almost all the restapprove of it, who meddle with husbandry: the words are these:

But if against this plague no Art prevail, The Trojan Arts will de't, when others fail. A woman barefoot with her hair untied, And naked breasts must walk as if she cried, And after Venus (ports she must surround Ten times, the garden beds and orchard ground: When she hath done, 'tis wonderful to see, The Catterpillers fall off from the trees As fast as drops of rain, when with a crooks For Acorns or Apples the tree is shook. .

They touch not Plants that are besprinkled with Wine. Theophrast. They presently dye with the smoke of the herb Pfora. Action. Hence it appears (faith Silvius) that the vulgarly called Scabious, is not Plora. The Cabbage is free from Catterpillers, if it be fenced with Vetches. The Worms found in Fullers Teafels, make them fall if they but rouch the Cabbage Catterpillers. Pliny. Strew your Cabbage with Nitres or falt earth, whileft it hath lost but three leaves, or strew it with ashes, and by the saltness of it, it will drive away Catterpillers. Geopon. Palladim in this matter prefers the Fig-tree ashes. If Crabs or river Crevish, were hanged up and exposed to the Sun for ten dates, they will drive Catterpillers from Pot hejbs. Cardan out of Palladius. Others wer the seeds just before they set them, in the bloud of a Catterpiller, or the juice of Marjoram, to free them from Catterpillers. A fea Onion fet or hung in a garden, hinders the Catterpillers from breeding. Some fow Mints, others Vetches, others Wormwood about their gardens to drive away Catterpillers. Some not without cause, have Coleworts and Garlick leaves in ther gardens, by the fume whereof spread every way the Catterpillers fall down. Palladim, where any man may easily read of many remedies against them. If a Horse devour them, swellings arise, the skin of him grows dry and hard, his eyes hollow, saith Herceles, and he prescribes this remedy: You must take the sharpest Vinegar and Nitre three quarters of a pint, Vitriel a fourth patt; mingle them and anoint the Horses hody, be careful that it enter not into bit eyes. Now we shall speak of the use of them in Physick, and in the Common-wealth. The Catterpillers web and covering (like to filk) being drank flops a womans courses. Math. If it be burnt and put into the notrile, it stops bleading at the note. The Catterpiller feeding on Privet, doth not only in a strange manner allure the Carp, if it be put on the hook for a bait, but also the dung of it put into the nostriles, presently helps the falling sickness in women, that proceeds from the Matrix, as I was told by a Midwife that was very experienced, and worthy to be believed. The Catterpillers that are upon Spurges (in the opinion of Hippocrates) are very good for purulent wombs, aspecially if they be dried in the Sun, with the double weight of duright! Worms, and adding a little Annifeed, bringing them into powder, and infusing them in the best white Wine, and to giving them to drink. But heavings following in the belly with numbress, let the Patient drink a little water and honey after it. Hipporrat. lib. de superfost. prescribes those ordinary Catterpillers that are in troops to be given in drink against the Quinsoy. Diescor. lib. 1. cap. 90. But unless they do profit by their secret quality, I think they are to be rejected for their open quality, especially in that disease. The Germans know that the hairy Catterpiller dried and powdered flops the flux of the belly. Nicander also useth them to procure sleep : for so he writes, And feremy Martins thus translates him :

Stamp bue wish ogt those worms that eat the leaves. ttehose backs are painted with a greenist hue: Andlin your body with's, and whilest that cleaves, You Shall wish gentle fleep bid cares adien.

There are in prickly and hairy plants, such a sube Nettle is, some downy, and hairy Catterpillers, by tradition are held to cure children, when they cannot swallow their meat for straightness of their jaws. A Catterpiller that lives on Pot-herbs being bruised and anointed where a Serpent hath stung, is very good. Avicen. If you rub a rotten tooth often with a Cabbage Catterpiller, it will foon fall out of it felf, faith the fame Author. Catterpillers mingled with Oyl, drive away Serpents. Diofeor. If you anoint your hands or other parts with the same Oyl, it will keep them from being hurt by Wasps or Hornets. Actim. Pliny citeth many superstitions things from the opinion of Magicians concerning the vertue of Catterpillers; which because I fee they are cast forth of the Schools of Divines, and I in my judgement do secretly disayow them. I will not repeat them here. They are meat also for divers Birds that we eat, and are useful for us, as namely Choughs, Starlings, Peacocks, Hens, Thrushes, to say nothing of Trouts, Robbinred-brests, Tenches, Carps, Pikes, which are easily deceived by a Catterpillar bair. And if you defire to know the waies of deceiving them; fee Terentinus in Geopon. Who is there (that I may not overpass the Physick of the soul given by Catterpillers) that hath not sung of Gods mercies shewed to the wandring Ifraelites, when all Egypt swarm'd and was even drowned with the deluge of them? Also amongst the Romans there was twice in one Summer such a cloud of Catterpillers, Anno 1570. that put them in great fear, for they left no green thing in their fields, but devoured all. Though the fruitfulness of the next year did blot out the memory of this grieyous punishment, yet we may not doubt but it put many of them in minde to lead better lives. God grant that we may escape by being corrected in the punishment of other men. Let us think no creature of God to be contemptible, for God can, if he please, make the smallest the greatest judgement.

CHAP. VI.

Of the Whurlworm.

THE Greeks call it zoordan; which Gaza interprets by Verticillus: Pliny changeth not the Greek word, but cals it Sphondylam; the Germans Eugerle, as George Agricola teacheth.
Gefper writes it was called Twaer, because it goeth diversly with sawed seet. The Northern English call it Andever; the Southern, Whurlworm, that is, a Whirl or little hairy Worm with many feet : Vincentim cals it Zuvarola, because it hurts gourds : Pliny was in an error, that makes this a Serpent, fince the kinde of life and reason it self numbers it amongst Insects. Should I here add the differences between Gaza, Pliny, Theophrastus, Absyrtus, Phavorinus, and the Scholialt on Aristophanes, and Erasmus, concerning the nature and form of this Whurlworm, Ishould indeed trifle, and rather bring fire to quench this fire amongst wits, than water. But I rather collect out of their diffentions, that there are two kindes of Whurlworms; one about houses, another in the fields. For so Aristotle and Absyrtus write. Staphulinus is like to the Whurlworms that are about houses. For saith he, your house Whurlworms copulate backward, and that in our fight, as Beerles do, the male coming upon the female, and they stick long in copulation. Away then with these triffings of Pliny, that would have these to be Serpents, which never copulate backwards: Hesschim and Favorium that follows him describe them thus: Men say that the Whurl is like to an Infett called Silphium, making a flinking smell, if any one touch it. But Arifophanes and his Scholialt, paint it out thus : A Wharl is an Infect like to a Blond-sucker. Camerfins out of Aristophanes shith, a wharl is a worm like a Leech, smelling most stinkingly. Whence I collect that there is a house Whurl like to Silphins, and smels so scurvily, which if you touch, runs away, and flinks for fear : for fo Aristophanes hath it, er aptirn. As the Whurl flying from you breaks wind stinkingly. In which verie I cannot but wonder that Erasmus (I know not by what Articism) cals the Whurl Telem, Chil. Adag. 3. cent. 7. Pliny saith it is a very small body, and blackish, which if it be rouched whilest it lives, and after it is dead, sends forth a most terrible smell. I confess ingenuously, that I never yet saw it nor know whether it be so by a contrariety in our land or climate. Concerning the field Whurl, we read thus in Theophrassus, as Gaza hath interpreted, of small wilde creatures that are bred outwardly, that is not in the roots but without them, none of them will feed on roots except the Whurl, and that leaves none untouched, for it is the proper nature of this Insect. George Agricola a most learned Philosopher, writes thus of Whurls that feed on roots: The Whurlworm is found under the earth wrapt up near the roots, (which truly I could never observe) and hence it hath its name sphondyle from a little wherve or whirl. It is so long and thick as ones little finger, a red head, the rest of the body white, but that it is black above, where it swels when it is full. This plague of Orchards, which wants not feet (for it hath six feet) and doth not creep, eats up the pils about the roots of young trees; nor doth it at all forbear the roots of wilde Cucumers, black Chameleon, Centairy, hogs Fennel, Birthwort, Briony, which no other Infect whatfoever will touch. This Whirl without all doubt is the Infect that Malliolina in his Book of his filthy Exorcisms brings in these words: There is, saith he, a certain worm which the Germans call Engar or Ingan; it liveth under the earth, is so long as ones middle singer, of a white colour, a black head, six feet, which be presented the colours and the colours as the colour of the colours as the colour of the colours as the colour of the colour by turning about, furrowing and turning up the earth, and eating the roots, maketh plants barren.

The third year after its generation, it breaks forth like flying Pilmires, which like their predecessors stick about trees, and consume the fruit. Then the like their predecessor Menta there were such multitudes of them, that all tempellas were attempted in vain, only they were driven away by charms (for so Malleolus reports) Cordin also speaks of them. Sponayles are worms under ground, the Germans call them Engar or Ingar, called so from the Greek

The next year after they are bred, they are alwaies commed into May Beetles! they hurt roots much, and feed on all kindes, (be the bitter or venomous) of young fprouts, and trees roots, fo that fuddenly the whole plants, or at least the leaves shall fades. When the Gardners feethis, they dig about the roots of trees, and fetch forth these Worms and kill them. They do us most hurt inche moneths of April and May; in July and August many are found with us in marish grounds, but there are no May worms but in Devonshire and Cornwall, and in the welt of England. This we must note diligently, that it fals out with Insects as with Plants, that they change their colour with the climate and the earth. I have feen and I have by me a Whurl like a Catterpiller, that is of colour white from Ash-colour, with a black head, if it be touched it collects it self into a ball, and it fitly resembles the Whirl in a womans spindle when they spin; whence it hath its name. It is benummed out of the earth, and cannot endure the air; being wounded, a moisture comes forth of a pale black, wherewith one may write Letters as by ena-

CHAP. 6.

melling. I have also a reddish Whurlthat lives in the earth two foot deep, whose head is exceeding black, his mouth forked, the neck is reddish from yellow, the back is scarlet dye, the six foreseet are red-lead colour, the belly and all the body are perfect yellow, but that on both fides near the belly there are eight red spots, for ornament. It is so long as ones middle finger, and Summer coming, it is transformed into a Fly. I have seen one also clear coloured, with a thicker body, blewish from the middle of the back to the tail. But from the neck it appeared more grayish, the head and seet were yellow, the mouth was forked and red: whileft it is young the whole body is white, in age it grows yellow and blew, and it begins from the tail. It is wonderful how it will carry its body long and broad waies by a waving motion, and yet never change the place, and in moving it often changes colours. For whilest it lies on the earth it is all white, but when it is forced to move, as if it were angry, it appears black and blew. It is altogether like to the great Worms in wood, as for the form of its body, but they cannot wreath and turn themselves round. I have seen a great Fly bred from this Worm that hath four wings. We have another that was found at the pots of Onions; and almost of the same magnitude with the black and blew one, with a green head, and fourteen feet; it hath horns, and a tail green from white: the whole body is green, white, bloud red, noted with mingled colours: we call it Onion Catererpiller, we here reprefers the figures of them all. Now we shall
add the opinion of Joseph Camerarius concerning Whurls, whose
judgement I alwaies commend. It may be, saith he, Whurls are See Joseph Cathose Worms that are found in the earth at the beginning of the Spring, merarim. that are almost white, or rather somewhat black and blew; which in Autumn become dark green, and with a shining skin, are coloured with a dark dye : their head is a light bay enclining to black, and something hard, that it can easily gnaw roots. Catterpillers soon rowl themselves up and die, and take other forms of Flies or Catterpillers. They are a finger thick, and an inch and half long, they have eight feet in the middle of their body toward the head. Our Countrey call them Eardinorms. Guilandinus faith that Whurls are Worms fo called, that like a Whurl they are round about the roots of tiees. Also other Worms that are black, somewhat reddish, and have shell covers, with many feet, like the Scolopondra (and they feem to be of kind unto it, but that they are rounder, and not fo broad) are found in the earth, and are dug out at the beginning of Summer, and roll themselves up the same way, as I said, if any one couch them. They also call these Enginesis, in Germany, that are yellow Worms under the earth with a black head, and near to that imall feet, but have more in the rest of their bodies. Their when they are dag up arm themselves into a round form, and beunder ground and eat the roots of Plants. Who would not account all these Worms that turn the melves round, to be amongst Whirls? 50 far Camerarins. Niphus upon Ariftorie faith that Whurls are a

CHAP.08.

1044

round kinde of Spider, in the middle of whole body a cavity is to be feen, that refembles a Whirl of a spindle. But this was his dream against the Philosophers minde, and he deceived us. What use there is of Whurls in Physick I never read, not do I know. This is certain from the Prince of the Philosophers, that Owls and night Ravens hunt after them, as also Moles, as it is probable: Cordus holds them to be venomous. In Egypt the Scorpions that they call Sibyle, eat Whurlworms, as Alian testifieth: but we shall pass from these to those called Staphylini.

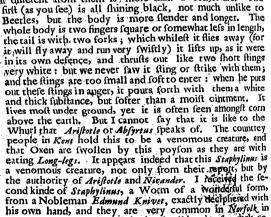

CHAP. VII.

Of a Catterpiller called Staphylinus.

Aza translates Staphylinos, a Parsnip, either by sleepy carelesness, or rather ignorance: Thut as it appears in the short expositions of Nicander, the ancient Physicians knew it not sufficiently. For the Scholiast writes that Staphylinus is a little creature like a Whurl: others say it is like the Spanish Fly. Hippocrates speaks once of it, but describes it not.

Aristotle treating of the diseases of Horses, cals it an incurable disease, if a horse swallow a

Aristotle treating of the diseases of Horses, cals it an incurable disease, it a none twillow a Staphylinus, that is like to a Whurl. But Absyrtus writes thus: A Staphylinus is like to a Whurl that is about houses, but is greater; it is bredevery where in the fields, and goes holding up the tail. Whence I perceive it were no hard matter to know a Staphylinus; if the home bred Whurls were not unknown to us. But that I may do my part and satisfie my Reader, I will produce two Insects with their figures, which I cannot tell whether they may be called Staphylini or not. But that they are not far different from them is, more than a conjecture, The

England. He hath a small head, of a dark colour from red, almost round; the mouth is small and forked. Next the head is hash three feer on each side; the two formes of them are short (like to Catterpillers) the orbit four are almost of a bloudy, colour, four dines as long. In the middle of the body under the felly it hath eight feer that are blunt, as allo a Catter-

piller hath. The tail is bunchy and forked with two hairs. We learn hence that both these kindes are naturally venomous, because two horses eating, hay and swallowing them down were syoln all their bodies over, and died by them. In which disease it will not be useless to know Abstract his remedy, that in the like case we may have it ready, and cure our horses. For its Horse eat a Staphylinus, whilest he feeds on hay or eats, he presently, cash him out again, by reason of the sharpness of the spirits of it, and as it were Vipers bloud. But presently he sweet exceedingly, first therefore soment the swellings, largely washing and rubbing them, with falt water very hor then take vinegar Lees, and put into them fine linnen cut, and boyl this with water, and anoint him all over: but when he takes his physick, let him remain in a hot house, and a soft stall, covered

red well with cloudies, and let a good fire be kept continually by him. Anoint him abundantly in the morning, then the third day wash him well with hot water, and dry up his weat, then rub him in a close place, and having rubbed him, anoine him with Nitre. And fear not though his lips and eyes swel, (for it useth so to fall out) for the Hosse will certainly recover suddenly by this means, and be as well as he was before. But whether these be the same with Staphylinus of Cordus, or the Coursilles in France, let indifferent men judge. They are found in Orchards sometimes so long as ones little singers, and they make hillocks like to Moles, and there they sleep. They chiefly do mischief to Thyme and Bider, yet not so, but they hur other plants and herbs also. If there be any that know any thing more certainly concerning Staphylinus, they are to be desired, for Physick and Philosophy sake, that they will not resuse to add their ralent. So at last the natural History of Insects shall be enriched by their labour, and shall repay them not only great thanks, but also their part, in a large increase.

CHAP. VIII.

Concerning the Scolopendræ and Juli.

THE Scolopendra, and Juli, and Cheefelips march in the last rank. They far surpass in the number of their seet, Catterpillers, Staphylini, and Whurlworms, and all kindes of Insects, whence they are called Many-seet by a peculiar name belonging to them. Aristotle cals this Scolopendra, Theophrassur, Scolopia; Dioscorides (from the destruction of Serpents) cals it Ophiostone; Varinus and Hespohus call it Amphydes phaganon; others, Sal, and some call it Thousand-seet, and Many-seet; the vulgar Greeks call it Scoloperra; the Latines also call this Scolopendra and Sepa, and dirty-hog, and hundred seet, thousand-seet, many-seet; which three last names also they give to Juli. In Hebrew they call it Ghazam; in Arabick, Alcampsia, and Alamus, as Silvaticus testifies; Albertus cals it Almus, Altapua; in the Polish Tongue, Stonogroback, Gaslanks; in the Hungarian Tongue, Zopas, Hiragopap, Matzkaia; in High Dutch, Ein nassel; in Italian, Centopede Vermi; in French, Chenilles Millepied; in English, Scolopender and Manysoot. In my judgment it differs as far from Julius, as a sea Lobster from a Creek. They are indeed like to one another, but these are alwaies less, nor are they so mischievous when they bite, nor so veno-

mous.

The great earth Scolopender is as long and thick as you have it pictured; the colour of the body is black from brown, and shining. To every incision a yellow little foot is joyned, that is, in the several sides sixey. It goeth sorward and backward with equal ease. For it goes with the head forward, and with the tail forward; and therefore **Nicander* and **Rhodoginus* call it two heads. It hath the part between the head and belly not single, but manifold; whence it comes to pass that this kinde can live though it be cut in sunder. This **Scolopender* being provoked bites so sharply, that **Ludovicus Armarus** (who gave me one brought out of **Africa**) could scarce endure him to bite his hand, though he had a good glove on, and a double linnen cloth; for he strook his sorked mouth deep into the cloth, and hung a long time, and would hardly be shaken off.

Another was brought from new Hispaniols, which had on the midst of the back a stame colowed line to adorn it; and a red side, and colour of the hair set it forth. It had seet like to hairs, and lifting it self upon them all, it ran very swiftly: this is worthy of the greatest admiration, that Nature having given to this creature a small head, yet it hath given memory to it, and theruse of reason, not in pints and pitchers, but in the largest measure. For seeing it hath seet innumerable as Rowers, and many of them are from the Rudder the head at a great distance, yet overy one knows his own office, and as the head directs, so they all frame their motion.

Anorbei

Another was brought to us from St. Angustines Promontory out of India, something greater Another was broken to do black and blew incitions, and twice as many light red feet, in body and feet; which had 70 black and blew incitions, and twice as many light red feet,

I doubt not but more forts of Scolopenders may be found, of almost all colours except green. yet Ardonus makes mention of one that was green. Each of them hath an inbred property to go to the roots of sword grass (as Theophrastem thinks). But Robertus Constantinus deserves to be whipt, and so doth Stephanus that followes him, and Ardoynus himself, who invent that a Scolopender is first a Serpent, then hath eight feat, then a horn in its tail, and lastly, it is a slow goer.

Albertus, Rhodoginus, Avicenna, are to be blamed also, who assir rashly, that no Insect hath above twenty feet, and they put the Scolopender in that number. Yet Nicander cals him two headed in these verses:

> The Scolopender hath each end a head; And fings with both, untill that men be dead : With feet like ores he wasts himself along, &c.

Yet by the favour of so great an Author, I might say that he hath but one head; though he can as easily move forward or backward with his tail conducting him, as with his head. And this I believe deceived Nicander and others. But he faith farther, that he bites at both ends; which is as falle as the former; for he bites only with his forked mouth, and hurts not with his tail, otherwaies than by a venomous touch, and by putting forth poyfonous bloud.

Oppianus holds it to be more fierce than the fea Scolopender, and so it is indeed: and I greatly wonder that Grevinus Parissensis, upon no authority, in his Book of Venomes should op-

pose this.

All Histories testifie that this creature is dangerous and venomous, and so much the more as it is more hairy. We read in Elian that the Rhytienses were driven out of their City by the multitudes of these creatures : and Theophrastus affirms the like concerning the Obseriers in Pliny: therefore though we have ranked the Scolopenders in the last place, yet in executing divine vengeance, they may sometimes challenge the first place. Countrey people do judge of fair weather by the frequent coming forth of the Scolopenders; and when they hide themselves they foreshew rain, as Marcellus Virgilius hath noted on Dioscorides. They have these uses in Phyfick. If they be boyled in Oyl, they take off hair with a little pricking, Gal. 11, Simpl. and Actim lib 7. They are enemies to Wiglice, that are most stinking creatures, and kill them with their breath, or earthern alive. Again, Wiglice being either taken inwardly, or anomited outwardly, are a remedy for their bitings, by a reciprocal, and as it were emulating antipathy, as is manifest from *Pliny*, and *Ardoynus lib*. 6. concerning poysons. When the land Scolopender hath bitten, the place is all black and blew, putrefies and swels, and looks like to the degs of red Wine, and is ulcerated with the first bite. Agineta. Actin adds that the pain is intolerable. Dioscorides saith the whole body pricks. All hold that this bite is incurable, and will admit almost no remedy. It hath (saith Anazarbens) symptomes, prevention, and cure, the same as for the flinging of a Viper, lib. 6. c. 23. Against this disease some things are taken inwardly, some things are applied outwardly.

Among finward Remedies, Ægineta commends Trifoly that smels like Bitumen, drank with Wine. Diescor. approves much of wild Rue, the root of Dragons bruised, the root, seeds, and flowers of Asphodill, the branches and leaves of Serpol, Calaminth, the roots of Fennel and Birthwort, given with pure Wine, or Wine and Oyl. Attnarius gives Nix with Wine, Pliny commends Salt with Vinegar, or rather the froth of Salt as being the better. Also he highly esteems of Horse-mints, or wilde Penniroyal taken in Wine. Actius bids give Wormwood and

Mints with Wine.

ಇನ್ನೆಗಳಿಗಳ

As for outward Remedies, first scarifie the place hurt, make deep incision, and draw out the venome by Cupping-glasses; then put in the juice of the lesser Centory, boyle with a third part of sweet Wine to the consistence of Honey, and binde a leather over it for eight or fourteen daies. Then foment the place with a spunge dipt in hot Wine, and this is a certain cure for the bite of a Scolopender. Anonyms. Pliny also prescribed divers remedies for it, as the dregs of Vinegar, washing the place with Vinegar, the flower of Millet with liquid pitch, Butter with Money, the green Figs of the wilde fig-tree with Verches and Wine, the Urine of the patient hurr and of a Wether, burnt Salt anointed with Vinegar and Honey, wilde Penniroyal with Salt, with Target Penniroyal with Salt w Salt with Tar and Honey, wilde Cummin with Oyl; and all kindes of Maidenhairs. Disferrides commends Garlick, with Fig-leaves and Cummin, and with Vetch Meal and Wine, also the leaves of Calamint, and burnt Barley with Vinegar; also he commends a Fomentation made of lowie Pickle: Archigenes bids forment the pare with Allum-water a Egineta faith, with much hot Oyl. Nonins prescribes hor Oyl of Rue.

Some commend exceedingly both outwardly and inwardly such things as are given against the biting of a Shrew. Aristotle writes that the Scolopenders are deluded and drawn forth with the fume of liquid Storax, and are easily taken whileft they stick to the clamminess of it.

Of the Juli.

THE kindes of the Juli follow next: which the Greeks call 'Haves and that as I think not The Name from their down, but from the tails of Walnuts and smal Nuts, whose hair being fastned in a hard substance, represents these Cats-tails, whence they had the names of Juli. I know the Latines call them Juli, but I should call them Galleys. For Lycophron called the Galleys of Paris that were swift with many ores, Yunonicus. Nicander applies the same similitude to Scolopenders; whence it may eafily appear, that Juli and Scolopenders are like one to the other. The Spaniards call these Centopeas: the Italians, Cento gambi. It may be the English after me will call them Gally-worms: Numenius also called earth-worms black Juli, as Athenaus witnesseth lib.7.

Black Juli that feed on earth are called the earths bowels; yet unless they have many feet, they cannot be numbred or named amongst the Juli. Juli are as I said, short Scolopenders, that for the number of their feet, exceed not only Hoglice, and all Catterpillers, but also all other Insects. Some Juli are smooth, others hairy. I saw a smooth one in a Cabbage Lettice

as thick as a small river bulrush, and of the same magnitude you see it here: it had a very black head, the back was of a golden colour, the belly was filver coloured from gray, the incisions and hairy feet were so many that they easily overcame both the eyes and memory. The second was all black, except a white line, which was drawn down the back, straight from head to the tail. The third was a decayed yellow, his head and feet were red, the failyards, and the hairs growing near the tail, were black and blew. If you paint the fourth with a body blackish red, and his feet and failyards lighter, you have rightly set him out: we caught some of these coming forth of moss growing on the barks of trees, and others lurking under trees and rotten logs. I could meet but with two hairy ones. The first was white of this form and figure, it crept on a wall, the short hairs that grew on

twere black. The second had a black and blewish belly, and a back spotted with an uncomly yellow. The mouth was red, a black eye, the hairs were hoary. It lies hid in old decayed trees between the bark and the wood; and also amongst stones that are overgrown with moste and thick downy hair. All these Gally-worms, if they be touched roll themselves up, and become round. I cannot tell whether they are venomous or not, but if they be, O happy Pennins, who divers times with his bare hand provoked and killed them, and yet was never bitten nor hurt by them. George Agricola tels us of a Gally-worm of a brazen colour (but he cals it a Scolopender) his words art these: A little Scolopender is bred and lives in the logs of trees, or in polts driven into the earth, (whence it hath its name) remove these or stir them, and it will come forth a otherwise it alwaies lurks there. It hath no feathers, but hath many feet : when it creeps it lifts up the middle of a body like a vault : if you touch it with a little wand or any other thing, it rols it self together. It is of a brazen colour, a slender body, not broad, but three singers long, or

Also it is found in another form, almost in the very same places, with a slender round body, the thickness almost of athread, of an allayed bright bay colour, the feet are so many and so small, that it is impossible to number them. It is four fingers broad in length; it remains under rotten trees and plants. Avicenna makes the Scolopender (which is also a Gally-worm) to have 44 feet only, and to be the palm of ones hand long; so small and slender, that it can creep into the ears. Lib. 4. Fen. 6. traft. 5. cap. 19. This creature, faith he, hath no venome, or but very weak, and caufeth no great pain: which is presently taken away with the flowers of Asphodils.or with Salt mingled with Vinegar. Our Gally-worms (faith Gefner) if they be in the housas, they will come rogether to St. Thomas Sugar, that is the most pure, (as Mice do to the best Cheese).

Our Countreyman Bruerus (a skilful and laborious searcher of Nature) reports that he hath seen here in England Scolopenders, and kept them, that shined in the night, and in mossy and broomy grounds shined with their whole body: who was no lier, and I willingly give credit to him; and so much the rather, because Oviedus saith he observed the same in new Hispaniola in the fields, and Cordus did the like in Germany in moilt cellars. It feems strange that Plutarchie lates, Lib. 8. Sympof. problem. 9. that a stripling at Athens cast up a small ragged creature, together with a great deal of seed; it had many seet, and walked exceeding fast.

The Galley-worm found in cellers, burnt to powder, doth wonderfully provoke Urine. Me-The Ufe. rula. The bloud of Galley-worms, with the moisture pressed out of Hog-lice, is a divine and excellent remedy to take away the white spots of the eyes. Arnold. Brev. 1. cap. 18.

And thus much for Galley-Worms, concerning Whose Natures, I passe over the opinions of Hesichius Aristosle, Nicander, Lycophron, Ardonae, because they are various, but true.

CHAP. IX.

Of Chisleps.

The Name.

The De-

Setiption.

Riftorle cals them from, the Greek Physicians, bring; Theophrassus, bring; Dioscorides, we calls; Abstrus, bring; those of Asia called them wares, from the likeness of a Bean, saith Galen, for it looks like it, when the Chislep rols himself up into a round body. Or, because, as our most learned Countreyman Stafford saith, (who was president of the Minorites at work refer in the reign of Richard the fecond) they are wont to come forth of the leaves and tops of beaus, and to grow from thence. Pliny cals it wood, from the brawny hardness of the skin. Others call it was, though for the fewness of its feet (for it hath but fourteen at most) and because it cannot arch it self, it seems to be a far different kinde from a Scolopender or Galleyworm. Farewel then all those dreams of Guillerinus, Vincentius, and Pliny, concerning this matter: for we deny that these are Galley-worms. But it is called ores, not from the form or flowness of an Asse, but because it is of the same colour, as Pennius writes: For it is a little creature with many feet, Affe-coloured, breeding in moit places. Dioscorid. lib. 2. cap. 37.

Gal. 3. de loc. affec. & 11. de simp, fac. cap. and spannis. The Latines call it Aselum, Cutionem, Porcellionem; Pliny said not well to call it Centipes, since it hath but fourteen feet: the English from the form call them Somes, that is, little Hogs: from the place where they dwell, Tylers-loufe, that is, Lice in roofs of houses: they are called also Thurstone, or Jovial Lice, from a spirit that was not hurtful, to whom our Ancestors superstitionly imputed the sending of them to us. In some places also they call them Cherbugs, and Cheslips, but I know not why. The Germans call them Efel, Efelgen, Holtzwentle, that is, Wood-lite, because they are oft-times found between the bark and the tree: George Agricola cals it also Shefflein, and sulgarly Keller Efel, as if you would say a Cellar-hog. The Saxons call it Efelchan from its Assection, as the Greeks, for the Italians, Porcelletto; the French, Cloperle; the Spaniards, Gainnilla; the Arabians, Harva, Hanra, Ganda, Schachalochada, Kiren, Grix, faith Sylvaticus. The Brabanders call it Piffe de Suege. It is indeed a ery imall Infect, scarce a fingers breadth long, and halfa

finger almost broad; (Ispeak of the greater) of a colour wannish black, especially that is found in dunghils and in the earth; but that which is under tyles and buckets is a perfect Assertion. It hath sources seet, seven on each side; every sochath one joynt, hardly to be perceived. It hath two short salivads, that it may prove its way. Being touched it turns it self round or (as Galen saith) into the form of a Bean, whence it was called waws. The sides about the feet are dented like a saw. It is bred under tyles, water-vessels, in the pith of sorten trees, between the bark and the tree coruping, as also under socks, growing from moishire putressing. Then they copulate, and after copulation they lay eggs (whence comes a worm) that are white, shining, like to small peass; they are many, and heaped up in the same place, as we observed in the year 1583, they live on warm ntoisture, and pass the winter in the chink, or wals, or secret places of houses. From the eggs first somewhat hard Worms are thrust our, which for some time stick almost unmovable, and are white: a length like their parents, they suck the dew and moisture. They are sound also in hot and dry Countreys; but where they regain by the dew of the night and vapours, what moysture was consumed in the day. Galen describes a Chillep thus: It is a house-bred living creature, with many feet, bred under watry vessels, and danghils, and if you touch it with your sound his rails token off.

Chifleps attenuate, open and discuss, as Galon hath taught us out of Asclepias. They seem contemptible to the sight, but they are excellent for diseases of the eyes. Also inwardly (for they are free from all poysion) they are of great lie; for being brusted and drank in Wine, they help distinctly of making water. Dioscorides. To which Medicament he adds this: Take, saith he, 2 or 3 Chilleps, boyl them in a little fish pickle, & drink of the pickle with water in two smal cups of an omice and half apiece. Pliny useth them for the Stone and difficulty of urine thus: Take Mice and Pigeons dung, of each half a dram; two Hog-lice or Chisleps brusted, drink it, and the pain will cease, and you shall void either the Stone, or much small sand. We finde in Gessers papers, that Marianns Barotizanus affirms the same: Galon gives them drink in sweet Wine, and so he cured many of the Kings Evill. Asterias most successfully used this kinde of remedy against the Athma and short windedness: Take Elaterium four grains, three Hog-lice from a dung hil, well Athma and short windedness: Take Elaterium four grains, three Hog-lice from a dung hil, well authority of the ancieme Physicians, much commends live Hog-lice burnt in the fire; and raken to a spoonful: for by their property they cure Assanta. Hollerius and Johannes Agricales make good this opinion by their property they cure Assanta. Hollerius and Johannes Agricales make good this opinion by their property they cure Assanta. Hollerius and Johannes Agricales.

them into most white Ashes, and then give them with Honey. Pliny saith they cure short breaths 21 being bruised with Athenian Honey, and with little hot water, drank through a reed, that the teeth and mouth may not grow black. Aerim for the same infirmity, gives five or fix with Hydroniel. And Marcellas the Emperick reports, ch. 35. that 21 Hog-lice stamped with the best Honey, and drank with water, will cure short windedness, puriveness, and such as are almost choked, and the Leprose also, beyond belief. Pliny writes that they are good in drink for Consumptions, who farther maintains, that a penny weight of them given in three ources of Wine to drink, will cure the pains of the loyns and hips. Alexis of Piemont subscribes to this; but Celius Aurelianus dislikes this, and the like remedies from Infects; being so persivaded from the unufualnets of fuch remedies, rather than from any hurt or inconvenience that proceeds from them. Experience confirms that many fresh Hog-lice well bruised and drank with Wine, Ale, Beer, or any convenient liquot, or applyed but outwardly, can cure almost all diseases of the eyes that arise from any thing growing in them, or growing to them, (except the Cataract) which we observed in the former Chapter out of the Breviery of Arnoldus. For a Quinsey, saith Galen to da. they must be licked with Honey, and the outside of the throat must be anointed with the same. Hog-lice boyled with oyl of Roses and heated in a Pomegranate shell, and poured into the ears that are pained, do cure them. Dioscorides. Gal. lib. sec. loc. & Enpor. commanded to boyl 2, 3 or 4 in oyl, and to press out the oyl and drop it into the ears of those were deaf, or had pains or rinklings in their ears. Oyl of Chilleps dropped into that ear is next an aking tooth takes away the pain certainly, that arifeth from a hot cause. Actim 24.27. Some mingle them with some convenient unguent and drop them into the ears. Severus (saith Galen), poured them into ulcerated ears with good successe. Faventinus ptescribes 21 Chisleps boyled in fowr Oyl, for pains of the ears proceeding from cold: in which he shews that they must be anointed about the ears, and a little must be dropped in. Cardan justifies the same remedy by experience. For Wens, Pliny takes a fourth part of Rolin or Turpentine to the dunghil Chillep, by which Medicament (faith he) swellings under the ears, Kings-evils, and all such tumors are cured. Marcellus Empericus hath the same, and Avicenna 2.2. cap. 729. and from the authority of others, he adds, that Chisleps taken in drink, cure the Cramp, and Alcuzes, which we have never known any to have said besides. If you often apply Oyl or Butter of Hog-lice to a pained head, you shall cure the pain. Gal. Eupor. 2. 91. and Absyrtus de quadrup. Brussed, they cure the Tonfils, and the diseases of the chops, Dioscor. A live Chislep laid to a whitloas, cures it ; and it takes away swellings, if it be laid on with a third part of Rosin or Turpentine. Pling. Take Unguent populeon J. ounce, Oyl of Roses wherein Hog-lice have been boyled j, ounce and half, Saffron iv. grains, mingle them and make an unguent, that is a most noble cure for the Hemorrhoids, that swell and are painful. Others (faith Alexander Benedictus) boyl these Chisleps with Fat or Butter, then they put to it the yolk of an Egg; and with this they allwage that cruel pain. Pliny faith, they cure all hardness of wounds, and Cancers, and Worms in Ulcers, being mingled with Turpentine. And to conceal nothing from you, I thought fit to add, that Pennius himself lying sick of the Ashma, used for a long time Hog-lice steeped in Wine: but having done it alwaies to no effect, by my advice at last he did twice or thrice take in the smoke of Brimstone through a tunnel, and he grew perfectly well from that horrid symptome. Take oyl of Violets iii, ounces, wherein let four Chisleps boyl till a third part be consumed: it restrains a salt humour, being outwardly anointed. An incertain Author. Hens, water Lizards, land Frogs, and Serpents feed on Chistops, as Theophrastus writes. Ambrose Paraus, a Chirurgeon of Paris, relates that one yomited a imall living creature like to a Chillep: and fuch a like thing Solerius hath written concerning a certain woman, upon the second Book of Acting.

Of leffer living Greatures.

CHAP. X.

Of Land Scorpions.

T is called or in Greek, from scattering its vernome, or as others wil have it, because it creeps lamedly. Also he signifies a Scorpion, or a kinde of Scorpion, whereof Nicander speaks in his Theriacks, the burning Scorpion must be pressed down when he creeps upon his feet, being a deadly creature. It is doubtful whether this be a kinde of Scorpion; it hath legs or clawes, and a sting in the tail. The Latines call it Scorpion, and Plinny Scorpio; Cicero, Planten, Varro, and Nomins, call it Nepamy which name Columella useth often. In Hebrew it is called Acrab, and Cancrab, because it pricks those that tread on it. In Arabick it is Natarab, Acrab, Necharab, Hacharab, Acrabi Rhasis cals it

Conches, Pandattarius, Satecollen; in Spanish it is Bscorpion, Or Alacram; in Italian, Scorpione, Scurrificio; in High Dutch, English, French, Brabant, it is called a Scorpion; in the Sclavorian language, Niedaradeck; in Illyrium, Istir; in Danish, Wollocow; in new Hispaniola, Alacrant.

1050

But that which hath a bunch on its back and drawes the tail after it rolled up, Silvaticus Cals Algararat. It is an Infect with a body of the fallion of an egg; as it were snoked all over, at the bottome a tail comes forth, joyned with many round knots, the last as it seems longer than the rest, so that only is armed with a fimple or double fling, and semething bended backward toward the end: it hath eight feet, and legs forked with claws, and ftrong pinfers; it hath a head as the others have, lying hid in the top of its breft, wherein you can perceive very small and almost no eyes, that Authors do scarce mention them. All Scorplons have tails, or no tails. Some of the tailed Scorpions are fenced but with one fling, bur

others with two; yet they do not differ in kinde and nature: Nicander describes sever kindes of land Scorpions. The first is white and not deadly. The second (saith he) liath a red mouth, from whose sting ariseth vehement heat, severishness, and intolerable thirt.

Ælian faith the fame. The third is wan and blackish, whose sling canieth a shaking palsie, and a Sardonian laughter, and vain, like to that of fools. The fourth is of a colour inclining to green: this so soon as it hath sung a man, a cold and shivering possessesh him, so that in the horrest summer he will suppose himself covered with stost. This kinde hath many knots between feven or nine, which is also the cause that he wounds so deep, by reason of the length of his tail. The fifth is black and blew, or a pale colour, of a large iterched our belly, for it feeds on grass, and is unsatiable. It not only flings with the tail, but also bites with venom'd teeth. Nicander cals its poylon Bisquest, because a Bubo rifeth on a man that he stings. The fixth is like to a shore sea Crab, yet not without a tail, but with a greater body and almost round, so that it represents a Crab with a tail. Matthiolus faith that he faw of this kinde fome that were black, murrey and green in the County of Arcinna, not far from the River Sarcia. The leventh is like a Grampel: also it hath claws greater than that; and this kinds is produced by Crevis on the dry ground, that are entred into some hollow places to escape the Fishermen: in which places if they die or corrupt, these kinde of Scorpions grow from them : as Ovid most elegantly hath set ir down :

Alian cals this the flame-coloured, for it is like the Crab that becomes redwith boyling. There is another kinde of Scorpion which we call Rha-fis, and the Arabians Scorpion, for Nicander and the Greeks never faw it: it is very bunchy, and runs swiftest of them all : it hath a tail for its small body that is very great; it seems to be pale, but the sting put forth is very white: Rhasis cals it fararete; Albuchasis, Grati; Avicenna, Algeraratie. It is found in the Eastern Countreys, especially in Goz, and in Hascari, as Gordenius notes. Philosophers say that the stings of other Scorpions infuse a cold poyfon: the Arabians say that only this one, insuseth poyson that is hot. I saw one brought sorth of Barbary, and we here give you the picture of it. The sting of all the tailed Scorpions is hollow, whereby they cast poyson into the wound: as Alian reports 1. 9. c. 4. To which Pliny subscribes, lib. 9. cap. 37. and Nicander in his Theriacks. Yet our Galen is of another minde, lib. 6. de loc. aff. c. 5. where he speaks in these very words almost, to those who ascribed a specifical quality of hurting or helping to humours or vapours. But the sting of the Scorpion deserveth much more to be admired, which in a very short time causeth extreme symptomes; and that which is injetted when it slingeth, is either very little or nothing at all, there appearing no hole in its sting: And indeeds when we sen that from the teeth pricks and stings of some creatures, whis or plants, there is folid porson conveyed into the wound by them; what need we sly unto secret bladders, and perchance such as were no ver sem that lie hid under the root of their slings, such as fruitful with have rather invented, than solid judgements and those that were studious for the truth? As I said, they have all six seet, besides the clawes that are their fore-legs, as crabs have, (which I should more willingly call arms) some of them (if would have a see hoursed). of them (if you look narrowly) are forked: their tail consists sometimes of 6, 7 or 9 knotted joynts: in the end of the tail is one hollow sting, two sometimes, (but that is more seldome). If it had its sting any where bit in the tail (saith Aristotle lib. 4. Histor.) because it moves it felf by steps, it were unuseful to sting withall: Estimasaith, that its sting is very mell, and scarse valible: out of whose invisible pipe, if there be any, such a venomous spirit, or mouter humour is poured in by a wound made, that is scarse perceived or sensible. It walks side waies as Crabs Lib. 11. c. 25, do, alwaies moving the tail ready to firste, that no opportunity may be let flip. The Males are the fiercer, flenderer, longer, and more sported on their bellies, clawes and flings. The Females again (as Avicema well observes) are greater, fatter, greater belies, and milder. The poy-

fon of the Male is also more dangerous, as Pliny thought, the Female is more gentle; but all their venome is white, unlets Apillodorus deceive us. It is apparent that they which have feven ornine joints on their tails, are the most curst: many have but fix, it strikes athwart and bendingly, All of them have their poyfon more violent at noon day, and in Summer, when they are hot with the Sun-beams, and when they are thirfly and are unfatiable for drink. The plague of it feems inrolerable, and which with a heavy punishment deftroys a man with a lingting death in three daies. Their flinging is alwaies mortal for maids, and most commonly for all women; and for men in the morning, before they have cast our their venome by some accidental stroke, and are new come forth of their holds. It is the property of Scorpions, that they will not fling the nalm of the hand nor smooth parts, and no where unless they feel the hair. Scorpions, as Pling Supposeth, will have no living creature that wants bloud: which Dr. wolfing of Twin a most leat- Liv. 19 C. 4. ned Physician hath proved to be false : for he saw, as he reported to Pennius, a Viper shut up in a vessel with a Scorpion, and they killed one another with mutual bitings and slingings. And Ælian Writes, 1. 8. c. 13. that they do fight and contend with Vipers, and all kinde of venomous Infects for their meat: Gefner faith it is certain that a Viper will devour a Scorpion: and from thence his bite will be the more grievous. Also Theophraftus writes that by the sling of Scorpions Serpents will dye, and not men. But Galen depending on experience, hath proved it to be falle, and appearcheth it for a lie. Penning shewes the fraud of Llian, relating lib. 6, c. 23. the wonderful traud of Scorpions: but fince I observed the same in Italy, I will maintain the truth of the Author, and free him of it. We know that the skill men have in that Countrey, they employ it all to escape from the Scorpions: whereupon they use sandals to defend themselves, and hang their beds on high from the ground, they place the props or supporters of their beds far from the wals, and fet them in veffels full of water, and many other inventions they have to deceive or to defroy the Scorpions. But the Scorpions get up to the roofs of houses, and if they can finde any tyle broken they will remove it, and one of the ftrongest of their Captains, (tru-Ring to the force of his claws) hangs down by this chink, and his tail hanging down, then another upon his back comes down as by a ladder, and takes hold by the others fail, and a third takes hold of the seconds tail, and a fourth by his tail, and so the rest, until such time as by links they can reach thebed, then the last comes down and wounds one that lies asleep in his bed, and tims back again by the links of his fellowes, and so all the rest in order shift away, unlosing as it were the chain, until they are all got up again upon one anothers backs. Also Clem. Alexan.

I. fromat. makes mention of this property. But they are not all venomous, no do they hurt or fling all men alike. For they do not live in Sleily, and if there be any there, yer they do no hurt; and therefore the Pfilli lost their labour when they undertook to free Italy from this mischief that was a stronger to them, in hopes of gain. Plin. lib. 11. cap. 25. Aristoile writes of the same thing concerning Pharos lib. 8. Histor. c. 29. of the Island Malta, Diodorus lib. 4. cap. 3. of the Countrey Noricum, Joseph. Scaliger, exerc. 189. 5. where you shall come in no place but you shall finde abundance of them, and yet they either fling not at all, or else there is no danger unto men by it. But now in Egypt, Sicily, Africa, and Albania, they wound mortally, as we read in the Books of Alexander de Alexandro, Pliny, Dioscorides, Strabo. In England, Scotland, Ireland, and Gas-cony, Scorpions cannot live, nor in the colder Islands more Northward. For though they cannot well bear the heat of the Sun by day, and therefore lie under thones all day; yet it feems they want no less heat in the night, for love whereof they come not only into chambers, but get into fearher beds, and lay themselves down sometimes close to those that are assess. Men report many things concerning the Countrey of Trent fet free from the deadly fling of Scorpions by the prayer of St. Vigilim. But it is at the Renders choise to take it for a Truth or for a Fable. In Scrthia it is far otherwife, for there if a Scorpion sting a Man, a Hog, or any Beast or Bird, they are certainly killed. Cardan faith that fuch as wound mortally are feldome bred. But Maithiolus reckons up an army of desperate symptomes that happen there, especially in Herruria, by the flingings of Scorpions, sometimes joyned with death. And Alian 1.8. cap. 13. reports that in Athiopia mens lives are not only endangered by the slinging of the Scorpions; but if they do but tread on their excrements, their feet blifter, and they can hardly be cured. He cals these Scorpions Sibritras, they feed on Vipers, Blind-worms, Lizards, Spiders, and other venomous Infects: whence they are so forcible with poyson, and have a kinde of graduation (that I may we Paracelsus) in the we of it.

Aristotle speaks of some Scorpions in Caria that are very loving to strangers. (Elian reports that this is about Laimus a mountain of Caria, where they are sacred to hospital Jupiter, and do not fling any franger; or if they do, they do them no great hurt, but they kill the inhabitants presently when they sting them. A Lion whensoever he sees a Scorpion slies from him as from an enemy to his life: witness Physiologus and St. Ambrose gives credit to it. Men say that such are never flung by Wasps, Hornets, or Bees, who are flung by a Scorpion. Pliny. Their Genera-Their Genetion is twofold, common by Copulation, more seldome, (so far as we know of it) from Putre-tation. faction. Some maintain that they are not bred by copulation but by exceeding heat of the Sun. Elian lib 6. de Anim. cap. 22. amongst whom Galen must first be blamed, who in his Book de fort. form. will not have Nature but chance to be the parent of Scorpions, Flies, Spiders, Worms, Nature. of all forts, and he afcribes their beginning to the uncertain conflictations of the Heavens, Place, Matter, Heat : But doubtless they do copulate, and they produce little worms alive (which I

GHAP. 10.

have feen) they are white and like to eggs, and they fit upon them to hatch them. So foon as their young are brought to perfection by them, they are driven away by their young, as it fals out with Spiders also, (especially those are called Phalangium) and they are destroyed by their young ones in great numbers. Scorpions are fruitful creatures, for oft-times they bring forth eleven. Some also suppose that they devour their young (namely Antigonus) but only one that is more cumning than the rest, which hides it self about the dams legs, and so escapes the danger of its sting and biting. This afterwards revengeth the death of all the rest, and kils its parents from above. They bring forth twice a year, namely in Spring and Autumn. The original of Scorpions from putrefaction is more rare, and it is many waies. For they are bred from Crevis corrupted, Pliny lib. 11. cap. 25. and from the carkais of the Crocodile, as Antigonus affirms, lib. de mirab. hist. cong. 24. For in Archelaus there is an Epigram of a certain Agyptian, in these words:

> The carkass of dead Crocodiles is made the seed, By common Nature, whence Scorpions breed.

Aristotle adds further, that from water Mints corrupting, Scorpions are bred. And Kiramides and Pliny fay they breed of Basil. An Italian that delighted much in the smell of Basil, a Scorpion bred in his brain, which afterward caused most vehement, and long during tortures, and lastly death. Hollerins, lib. 1. cap. 1. of his practife. Gesner heard as much of a French maid, as he testifieth with his own hand writing. Doctor Banchinus second to none for Anatomy, reported to Doctor Pennius, that he hid Basil in a wall at Paris, and after a certain time he found two Scorpions in the same place. Chrysippus therefore not without cause, dispraised Basil to many men. There are some that maintain that if a man eat Basilthe day he is stung with a Scorpion he cannot escape death. Others say, that if a handful of Basil be bruised with ten sea Crabs or river Crabs, and be left in a place where Scorpions haunt, all the Scorpions will come about it. Pliny lib. 20. cap. 12. But Diescorides lib. 2. 135, and lib. 32. cap. 5. saith that Crabs will kill Scorpions, if they be put to them with Basil. Albertus Magn. lib. 19. anim. cap. 18. Some are of Avicenna's opinion that they breed of corrupt wood, and are made many waies.

The place conduceth much to their generation and production. For in Hispaniola, the Canaries Numidia, Scythia, Pescara, Barbary, Ethiopia, there are such multitudes of Scorpions, that the inhabitants are oftentimes forced to forfake their habitations : Oviedus, Thevetus, Leo Afer, Pliny. The Countrey about the Lake Arrhata, in the East Indies near the River Estamenum, is to fruitful and so peffered with Scorpions, that the inhabitants not knowing what course to take, left the place to them. Elian lib. 17. cap. 40. When you are two daies journey from Sufa in Persia into Media, you shall light upon an infinite number of Scorpious, whereupon the King of Persia being to ride that way, commands the Citizens three daies before to hunt the Scorpions, and affigus a very great reward for those that catch most of them. If he should not do so, by reason of the multitude of Scorpions lying under every stone, there could be no pas-Sage. Elian. lib. 15. cap. 26. The East Indies, as Agatharsis tellifieth, and Africa also, breeds abundance and very great Scorpions, which also wound with their stings as the others in Europe do. The Scorpions of America are the smallest of all, yet the most venomous, next to those of Africa: their poyfon works to suddenly, that it immediately flies to the heart and kilsthe party that is stung. The people of Noricam near the Alpes, have in their Countrey many Scorpions, but (which is wonderful in Nature) they are all harmless, as Scaliger affirms. In Pharos alfo, and the Territory of Avarrium, the Scorpions (as we faid before) do no hurt. In some places of Helvetia (as about Rappi/vill) there are found very small Scorpions, and innocent. Gesner. So it is also in some Countreys of Germany. In new Hispaniola there are a great many Scorpions, but not very venomous; there is some pain that followes their slinging, but it is not great, nor of long continuance, and men are more hurt by the stings of Wasps or Bees: unless it were so that the Scorpions were fasting, or newly wounded. Manardus. But the Scorpions in the Island Ferrata (which is one of the fortunate Islands) and Coptum in Agypt, Cause great pain, and their Venome is mortal. In Castile a Countrey of Spain, the countrey folk ost-times whilest they plough up the ground, do finde innumerable Scorpions, clustered together like Pifmires, where they lye hid all the winter. Matthiolus. The colder Countreys have no Scorpions, as Gascony, England, Ireland, Scotland, Denmark, and great part of Germany, or if there be any there, they are not venomous. Elian reports a wonderful thing concerning the Priess of Isia which in Copto, a City of Egypt, where there are abundance of deadly Scorpions, they can treat which in Copto, a City of Egypt, where there are abundance of deadly Scorpions, they can treat the contract of the company of the second sec upon them, and cast them on the ground, and yet receive no harm by them. Also Pfylli, a people of Africa cannot be hurt nor flung by Scorpions. For when they come to any venomous creature, it presently becomes stupid, as if it were charmed or struck deads that it cannot move. Also all their Hogs, but not the black ones, (for if they be stung they die presently) are free from their stings. Lastly, a Scorpion nor any other venomous beast, doth not hurt a Stellio, an Ascalabotes, a Crab, a Hawk, as Galen ad Pisonem, and our friend Gesner have observed.

Their Food.

Their Ufe.

They live by eating the ground, and in some places they feed on Herbs, Lizards, Blinde-worms, Whurls, Beetles, and all poyfonous beafts. Elian. But he that shall tread on the excrements will have his feet bliffered. The Hens, lbis, Vipers eat abundantly of them, whence Aristotle cals the Viper months. And they are not more fit for their food, than they are a remedy

for us. For being laid to their own wounds they made, they cure them, as is generally known. Their use is Also a Scorpion bruised resists the poyson of a Stellio. Pliny. Some bruise them and drink Physics. them in Wine, catting away their tails. Others lay them on burning coles, and perfirme the wound, and then ftrew the Scorpions after upon it. Some binde them to the wound, being bruifed with falt, Linfeed, and Marth-mallowes. Against the Stone, Lanfrancus his powder: Take 20. live Scorpions, close them in a pot with a narrow mouth, and with a fost fire burn them to affies, which is a wonderful remedy against the Stone: A Scorpion corrified and burn to affies and taken with bread, breaks the Stone of the bladder. Author ad Pisonem. Three Scorpions closed in a new earthen pot, and covering it with a cover well luted, with a fire made of Vine branches, bring them to ashes in an oven; the Dose is 6 grains with syrup de quinque radicibm: it wonderfully drives forth Rones of the kidneys. New Authors exceedingly commend the afnes of Scorpions amongst the remedies against the Stone, and the oyl of them injected into the bladder, and anointed outwardly. Alexand. Benediction, Aggregator, and Leonellus Faventinus out of Galen (En-201.3) teach us to burn three small Scorpions, and to give their ashes in syrup, or a decoction, or ionie confection proper for it, to break the Stone. And lib. 2. he bids us to mingle them with fat, being calcined, and so to exhibit them; because otherwise the Patients would abhor the eating of them, wherefore they may be given without suspicion. That Medicament of Abolant, that Arnoldus praifeth so much, is made of the ashes of Scorpions, as you may see in 2. Breviarii cap. 18 as also the admirable fyrup of the King of France against the stone, which is described in the same Book and Chapter. Rondeletius, capite de calculo, in his practife, maintains that a Scorpion is cold, and therefore to drive out the Stone we must use the compound, and not the simple oyl of Scorpions. Matthiolus teacheth to make that compound oyl, Commentar. pag. 1407, 20. But before him, Luminare Mains, made that after this manner. Take round Birthwort, roots of Gentian, Ciperus, Barks of Capers, of each j. ounce, oyl of bitter Almonds j. Kift, let them stand in the sun 30 daies; then add to it 19 Scorpions, and shutting the vessel again very close set them in the iun so many daies as before. Then strain the oyl and keep it for your use. Others prepare it thus: Take old Oyl as much as you please, put as many Scorpions into it as you can take in July (for then are they most venomous and fittest for this femedy) add to them white Dittany, leaves of Wormwood, Betony, Vervain, Rosemary, of each j. handful, set them a sunning for a long time, then distil them in balneo in a Limbeck. It is called St. Bernards Oyl. It powerfully provokes urine. Anointed on the groin, it is prevalent against the bitings of Scorpions, how venomous foever. It drives out worms miraculously. Braffavolus. Of Oyl of Scorpions and Vipers tongues, is made a most excellent remedy against the plague, as Crimium testifies, 1. 7. Manardus faith that Oyl of Scorpions is now made with old Oyl, adding many medicaments thereto commended against poylons, and it is admirable in the plague, and against all venome. I know a man that having only this remedy, made no reckoning of the greatest plague; and had not only preferred himfelf but his fervants also, whom he fent to visit people that were fick of the plague; and I know very many that escaped only by anointing themselves, having drank the most deadly poylons. So layes Manardus, A liniment of Scorpions against the plague, and all poylous, is described by Fumanellus, lib. do cur. pest. cap. 12. A Scorpion is good also against a wound given by a Viper, saith Galen 1. de simpl. Samonicus commends them highly against pains in the eyes, in these verses:

If that some grievous pain perplex thy fight; Wool wes in oyl is good bound on all night. Carry about thee a live Scorpions eyes

After of Colemonts if show do apply, With bruised Frankincense, Goats milk, and Wine, One night will prove this remedy divine.

If any one troubled with the Jaundies take Scorpions bruifed in Wine and Honov Galen faith he shall quickly finde help. Kiranides, against a Quartain ague, Quotidian, or Tertian, prescribes a Scorpion put into a glass of Oyl about the want of the Moon, and kept there; and with this Oyl anoint the whole body on the joynts, and the foles of the feet, and the palms of the hands, very well before the coming of the Agne. Plinins secundus faith, that a Quartan Ague, as the Migicians report, will be citted in three dales by a Scorpions four last joynts of his tail, together with the gristle of his ear, so wrapt up in a black cloth, that the sick parent may neither perceive the Scorpion that is applied, nor him that bound it on. But let these superstitions pass, and we shall speak something of Anridores against Scorpions.

First therefore of Prophylasticky. Magicians deny that a Scorpion can pass over if he be compalled in with a branch of Tarmore: and the herb laid upon him kils him. Pling. A smoke made against the with Brimstone, Galbanum, and an Asses hoof, drives away Scorpions. Rhafts. Take Storax, Arie-singing of nick, Shappe durig, far of the caut of Sheep, equal parts, dissolve them in Wine, and make a sume Scorptone, by the holes of Scorplons. Ma Radifficut be put into their holes, they will not come forth. A Scorpion burnt is good; the liver of an Asie, Sandaracha, with Butter or Goats suct to make a fume. Varignana and Diophanes in Geopon. Rhafts commends the root of Elecanipane carried about one. Maker Writes of Monthesk thus :

> Men fay that Housteek hath so soveraign a mighty Who correct but that; no Scorpion can him beter

Origanum.

Cure-of the Ringings of Scorpions.

1054

If a man anount his hand with an herb called Paris, or with the juice of the root, he may fafely take a Scorpion in his hand, Flaminim. Grapes preserve men from the stingings of Scorpions, as also Filberds carried in their Purses. Aerius. Also the seed of wilde Docks either drives them away, or their slinging is not mortall. Dioscorid. Who also saith from the Africans, that Basil will do the like. Larks spur, and wilde Campions also makes them shupid and assonished: The same Author. And saith he, they report, as long as any man hold Carduus in his hand a Scorpion will not bite him, or if he do, it will not hurt him. The feed of Wood-forrell drank, preserves one from Scorpions. Avicenna. If you lay Solomons Seal under you, it keeps of Scorpions. Isidorus. And Pliny learned from the Inhabitants of Africa, that he that Carries Radish-root, or Turnsole, or a dried beast like a Lizard about him, Scorpions will not hurt him: So Dittany in smoke, or wilde Mints, or Oyl of Scorpions anounted about their holes, will keen then) from coming into the Chambers, Rhafis. But these things will kill them laid upon them: Radish-root chewed, broad leav'd Basil that growes by the water side, Mallowes leaves, black Hellebore, (but the white will quicken then when they are dying, if Pliny may be believed) Scorpions graffe, Rose-root, Basil with a red flower, the spittle of a cholerick man fasting, Rhasis, Pliny, Avicenna, Democritus in Geopon. To cure the sting and wound Guilielmus de Placentia. prescribes this ingeneral, namely, to give and apply inwardly and outwardly, presently, good Theriac; then the part affected must be cut, and an actual Cautery set to it, and the poyson drawn forth with Cupping glasses. Galen bids binde the part above, and to cut off the parts affected. Gal. 5. de loc. aff. c. 3. But fince that is a very hard and cruel remedy for the patient, I thought fit to write from the Antients what remedies are cures for this wound. You shall first know the stinging of a Scorpion thus: The place is presently red and inflamed, and by turns, (as in an intermitting Ague) waxing cold, and the fick is fometimes better, fometimes worfe. He sweats all over, his hairs stare upright, his whole body waxeth pale, his secrets swell, he breaks winde backwards, his eyes run with clammy tears and filth, his joynts grow hard, and he hath the falling of the Tuel, he fomes at mouth, he is drawn backwards by convultions, and troubled with the Hickop, and sometimes great vomiting, he is quickly weary of labour, he is vexed and troubled with semse of horror, the outward parts of his body are cold, a pricking pain runs over all his skin, fometimes he thinks that hail falls upon him; for Galen asking one that was stung with a Scorpion, what he felt, (3. de loc. aff. c. 7.) he said he seemed all covered over and almost frozen with hail. Actim addes, pupumsan or warts of the fundament like Ants; after these fainting, then swounding, and finally death. Actim writes, that if the lower patts be sung; the groins swell presently, if the upper parts, then the Arm-pits. The wound being now known and viewed, and opened by section, and the generall cure we speak of applyed, when are the same states are those sections. whereof Authors are plentifull. Galen amongst outward remedies, reckons Balfamum, true Worm-wood, or the juice of black Mirtle-berries anoynted. Also he diversly commends the spittle of one that is fasting, and useth it as a Charm, lib. 10. Simpl. And he bids give inwardly the Balfam with Womans milke, the Saphire stone in Powder, Assa fatida, Scordium, Centaury the lesse, Rue, Castoreum. Out of Cassion the Phisician he commends this: Take Assa fatida, Galbanum, each alike, make it up with the decoction of Scordium, and round Birthwort. The Dose is the bignesse of a small Nut with hot water. Out of Andromachus he commends this, lib, de Theriac. Take Theriae two drams, Wine four ounces, mingle and drink them.

Dioscorides oneward remedies applyed. Cyprus bruifed and laid on. Amomum used with Basil. The Milk of the Fig-tree, or the juice of Sage Calamint. dropt in, the Scorpion it self bruised. Sow-thiftle beaten. Succory. Hawk-wood. Balm. Buth-flower. Mull-berries. Larks-heets. The flesh of a Fish called Smarie. The Barbel Fish cut in two. A Fish called Lacerta salted and cut in pieces. House Mice cut asunder.

Internal remedies from Diescorides. Cardamonum, Juice of Myrtles. Bay-berries. Horse or Ass dung. Seed of Campions. Mullens.

Chamæpitys. Scorpion-graffe. Turnfole. Trifoly. Scordium. Lotus rustica. Basil with Barley-flour. Wheat-meal with Vinegar and Wine. Marjoram with Vinegar and Salt. Asia dissolved in Wine. Sea-water. Quick Brimstone with Rosin and Turpentine. Salt with Linfeed. Galbanum made for a Plaister.

Other External remedies out of Avicenna. Marjoram laid on with Vinegar. Root of Coloquintida bruised. Reed roots bruised. The Shell of an Indian small Nut. Rams flesh burnt. Mummie four grains, with Butter & Cows milk. Decoction of Ameos. Bran Bran plaister-wife. Wine new boyled. Bark of Frankincense. The white Thiftle. White Thorn. Pine kernels. Dates. Figs. Mountain Poly. Anacardi. Ashes of Kaly. Wheat Bran boyled with Pigeons dung. Salt of Urine. Oyl of Wormwood. Decoction of Nettles or Chamomile. But white Naptha is the principal remedy, laid on hot. It is also good to suck out the ve- Wilde Saffron-leaves and fruit. nome with ones mouth, unlesse it be first ul- Citron-seed. cerated, and then to apply such things as in- Mummie. flame, as Pellitory of Spain, and Garlick. Seed of fowr Dock. The herb Phalangium. Daffadil feed and flowers drank in Wine, and also Bramble flowers so taken. Parinip-feed, Turnfole. Cypress boughs. Rre.

Loveage with black leaves. The juice of Dog-fermel Zdrank. Sow-thiftle The Decoction of Gentian-root. The bark of Birthwort. Pennirovall. A broiled Scorpion eaten. River-crabs raw and bruifed, and drank with Affes milk. Mans urine drank.

Internals of the same Author. Juice of Worm-wood with Vinegar. Doronicum. Cinamon. Myrrhe. Galbanum. Roots of Coloquintida and Gentian. The Indian small Nut eaten, and the Theriac The root of Squills eaten, is admirable against , the bitings of Scorpions. Locusts broiled and eaten. Juice of Onions and of Worm-wood. Juice of the Jesser Centaury. Also new boyled Wine helps much.

The Antidote of Anderam, otherwise Braz. the King of Sicily. Take Castoreum one dram, Scordium two drams, Costmary one dram and half, Assa fatida three drams and half, make it up with Honey. The Dose is one dram and half, or two drams with wine.

Another of the same. Take Birthwort round and long, each one aureus, Cumin-seed three drams, Assa fatida, Caraway, Rue-seed, each two drams, Castoreum four drams, make it up with Honey. The Dose is two drams with the hot decoction of Gentian root, or Birthwort, and wine; he gave also two drams of Assa fatida, and sometimes three drams, Wood Laurell with Vinegar,

A Medicament of Andro a Greek Philosopher. Take Rue-feed, live Brimstone, of each fix aurei, Castoreum one aureus, Asía fatida one aureus and half, Pellitory of Spain, liquid Storax, of each one aureus, make it up with Honey. The Dose is half an ounce with Vinegar of the best wine.

Another excellent remedy. Take Rue-feed one aureus, Castoreum half so much, Birthwort round and long, of each two aurei, roots of Gentian, Asa fatida, of each eight drams, (or eight aurei) make it up with Honey. The Dose is one dram and half with pure wine. The Electrony of Zeno, or Diaruta. Take Assa farida, bitter Costus and sweet, each five aurei, round Birthwort, Agarick, each two aurei, Castoreum, Cinamon, Aloes, each three drams, roots of Orris, Sarcocolla, each one dram and half, long Birthwort, Gentian, each fix drams, make it up with Honey. The Dose is three drams. He commends also the great Theriac of Andromachus, Esdras, Mithridate, and the Theriac diatesferon. The description of it is this. Take Gentian, Bay-berries, long Birthwort, Myrrhe, each alike, make it up with clarified Honey. The Dose is one aureus with hot Water. Another against the bitings of Scorpions. Take seed of wilde Rue, Athiopian Cumin, seed of Trifolie, Minianth, each alike, with Vinegar what may suffice, make a Confection. The Dose is one aureus. Another. Take Garlick, Nuts, of each one part, Rue leaves dried, Assa fatida, Myrrhe, of each half as much, make it up with milk. The Dose is three drams. Another. Take Castoreum, white Pepper, Myrrhe, Opium, of each alike, make Troches. The Dose is three oboli with four ounces of wine. Another. Take Opoponax, Myrrhe, Galbanum, Castoreum, white Pepper, each alike, make them up with liquid Storax and Honey. Another. Take roots of Coloquintida, of Capers, Worm-wood, long Birthwort, wilde Succory, each alike, Give children one scruple, men one dram, it is of wonderfull vertue in this disease. Another. Take green grassewort juice with Cows milk, boyl it like to an Electuary. The Dose is two aurei, they say this helps much. Another. Take Opium, seeds of white Hen-bane, make it up with Honey, and mingle it with hotter things to temper it. If any man will have more from Avicenna, he shall finde it Can. 4. Fen. 6. Tratt. 3.

Externall remedies one of Rhasis. The hor Oyl of Anacardi standing in the stell of an Eggs, rubbed in, let the wounded part be first bound, then let it loofe, and anount it with Jesamin Oyl. The third day open a vein, but after meat and sleep. Also anount the place with Castoreum, Melanacardinum, and Garlick. laying on a plate of lead anounted with Quick-filver.

Sagapenum applyed outwardly heats the wound, and a Weafels flesh laid over in

Rub the place with a Topaz, and it will be cured. The wound is bettered by rubbing a Flie upon it.

It may be cured with water from Radish-leaves, and Oyl of Mustard-seed, and Marjoran. Serapio writes that boyled Butter doth good.

Internals of Rhasis.

Sweat must be procured any way, by external and internal means. Take Nuts, and Garlick cleansed, of each alike, bruise them.

The Dote is one ounce, and an hour after let him drink wine. Others adde to this a like quantity of dryed Rue, Myrrhe, and Asia. The Dose is three drams with pure wine.

Another. Take Nigella seed one part, Assa three parts, the Dose is one Trochis, with one ornce of wine.

Another. Let him drink strong Wine till he be almost drunk, and in the morning open a vein. Another. Take roots of Coloquintida, bark of roots of Capers, Worm-wood, long Birthwort, Endive-feed, of each alike, make a powder. The Dose is one dram, for children one scruple.

Another Theriac against the stingings of Scorpions. Take round Birthwort, roots of Gentian Bay-berries, roots of Capers, Coloquintida, Worm-wood, Swallow-wort, white Briony, each

alike, make it up with Honey.

Another. Take Myrrhe, Opoponax, Smallage, each one dram and half, white Briony, long Birthwort, Pellitory of Spain, each fix drams, feeds of Rue, Gith, Trifoly, each three drams, Gum, Arabick, what may suffice, with Vinegar make Trochis. The Dose is one dram to one dram and half. Another. Take Cloves of Garlick cleanfed five drams, Nuts ten drams, Affa one dram, incorporate them well. The Dose is two drams. Another. Take Gentian, Birth-wort, Myrrhe, bitter Costus, Rue, Castoreum, wilde Mints dried, Pellitory of Spain, Pepper, Githfeed, Alla fatida, each alike, make them up with Honey, The Dose is one aureus with wine. Also the powder of Eringo root is good with hot water, and the powder of Dodder, Also one aureus of Napellus with water. Ivy and Polium with water are very profitable. If a fever come upon it, open a vein. Affes driedung drank with wine is very helpfull. Thus much from Rhafis. External remedies from Albucasis.

Anoynt the place with Oyl of Ben. for many dayes, or Oyl of Jasmin, grinde Euphorbium with it, and Castoreum, or else Castoreum and Garlick ground together, with old Oyl for a

plaister.

A Frog cut and laid on is very good. Take old Oyl one pound, Wax four ounces, Euphorbium one ounce, melt it in the Oyl, and anount the place with it. Internals from Albucasis.

Let him drink hot milk from the Cow with wine or Honey. Cinquefoil-feed, and lees of wine,

are Theriac in this disease, as also Rocket-seed.

Hiera Anacardina against the stings of Scorpions. Take Pellitory of Spain, Gith-feed, bitter Costus, black Pepper, Acorns, of each ten ounces, leaves of Rue, Affa fatida, roots of Genrian, long Birthwort, Bay-berries, Castoreum, Cassia lignea, Mustard, Melanacardinum, of each five drams, make up the powders with Oyl of Nuts, and with juice of Radish-root make it complear. The Dole is one dram daily, it causeth sweat. The brains of a hen in drinkis very

Haly Abbas brings nothing that is new, but only takes other mens prescriptions. Conceming some Seals (amongst the hundred sayings of Ptolemy) and some fashions for Charms, both he and Kiranides make mention, but a Christian beleeves it not, nor are they worthy to be recorded by him.

Toannitius mightily commends a Plaister with Garlick and Butter, or to anount the place with

Oyl of Peter, or pure juice of Leeks.

He prescribes to give inwardly of the pith of the greater Spurge four scruples, with warm wa-

Rabby Mosses prescribes one Sextula of Frankincense with Wine sufficient. Also he exhibits Pigeons dung dried, and finely powdered with Butter and Honey. The Dose is two Sextulas. Guil. de Placentia bids men give drie or green Marjoram inwardly, to drink it with mans Urine, and to apply it outwardly.

Constantinus 4. Pantechn. lib. commends Hens dung, or the heart applyed outwardly, and Pimpernel inwardly, taken with Wine, and powder of Gentian, Cinamon, Centaury.

Averrhois extolls Bezar stone above all, the Dose is the fourth part of an aureus.

Aristotles mei baupadur durquatur, describes a kinde of Locust that is an Antidote against the Scorpion, which eaten presently cures the stingings of Scorpions.

Serapio affirms the root of the male Coloquintida bruised and laid to the wound, that it will take away the pain. He commends inwardly Wormwood, Lettice-feed with Garlick, Munny two grains, with the decoction of Sampire, and leaves of Laferwort.

Of lester living Greatures. CHAP. NO.

bribafius approves of the Lilly roots, and leaves, brinsed and applyed, as also a Plaister of Veryain, and it is thus made. Take Veryain three ounces, Roffin fix ounces, Wax, Pitch, of each two ounces and half, Oyl half an ounce, make a Plaister.

Jamardly he commends the affices of River-crabs with Goats milk, or juice of Agrimony two

ounces, with a draught of Wine, or the root of Dragons bruifed, with wine.

Action commends water Calamines and Nip, which fome think to be to called because it is an Antidore against News, that is Scorpions. He faith, Garden-finalls bruifed and laid on draws forth the venome; he commends also upright and green Vervain, if it be laid on for a Cataplaim. Also Sheeps dung laid on with Wine. He makes also this Plaifter. Take wilde Rue bruifed with Vinegar one dram, Waxone dram, Pine Rosin three ounces, make a Plaifter, it is admirable against the stingings of Scorpions.

Ismardly, he writes that Garden Patinips cure beyond expectation, be it eaten green or dried, and drank with Wine. Take Caltoreum, Lazerwort, Pepper, of each four drams, bitter Costus, Spikenard, Saffron, juice of Centaury the leffe, of each two drams, clarified Honey what may fuffice, mingle them. The Dole is the quantity of a Hazel-nut with Wine and water; it drives the Scorpions venome from any part, as Arine proved on himself. Eginta gives quick Brim-

flone bruifed with a River-crab to drink in Wine,

Nonus bids lay on Licharge or Silver presently upon the place stung, and he commends Brimstone, if it be taken the quantity of an Exprise bean with eight grains of Pepper in Wine. Anatolism commends this, to iprinkle Crows dung upon the flinging of the Scorpion.

Silvaticas out of Haly, commends a Want, or the greater house Mouse laid on, and our of

Serapio, Petyter powdered and drank.

Orpheus commends Cord in drink, and the flone called Scorpiodes laid on with a Garlik-head. Ottavins, Aretens, Horntinus, Zoroaftres, Florentinus, Apuleius, Democritus, and other Authors of the Geoponica, adde but a few things to the Medicaments of the Antients, belides some old wives fables, and inchanted prines that are hatefull to God and man. Pliny tells such a fiction, but no man can tell with what reason or credit: If, saith he, one that is flung with a Scorpion get up upon an Affe, with his face toward his rail, he shall do well, but the Affe will suffer. Myrepfine extolls the herb Plower-de-luce, well bruifed, and then drank with Wine or Vi-

Quinous Serenus Whites thus, and adviceth,

These are simulatings, but yet their wounds and And in pure budies his king do milf barm, (great; For when our senses inward do remeat, And now are full assess, they need some charm, The Spider and the cruel Scorpion Are wont to fling, witnesse great Orion,

Slayn by a Scorpion, for poylons small Fluve mighty force, and therefore presently Lay on a Scorpion bruised, so recall The wender, or Sex-water to apply Is held full good, such versue is in brine, And 'sie approv'd to drink your fill of Wine.

Pliny amongst outward means addern these. Mustard-seed bruised, Pimpernel, roots of Chamaleon, Sea-weeds, wilde Onions, Hares rennet, Tortoyle-gall, afnes of Hens dung, Coltsfoot, and Mullen-leaves: It is exceeding good to purge the body within, very well, with the feed of wilde Cucumber, and Malerian; and then to double the jnice of Lettice, and to drink the dried leaves and stalks in Vinegar.

Ammi drank with Linfeed. Wilde Cunsin. The third kinde of Capita. Fennel-feed. Root of Cyprus. Great Saffron. Creffes. Yellow Camomil. The tender stalks of green Figs. Bay-berries.

The feed of Hyacinth with Southern-Wood. Seeds of Trifoly, and Rocker. Four oboli of Agarick. The juice of Jelly-flowrs and Plantain. The Afres of River Frogs. In Wine. Chámaibythe. The herb Nodia. Seed of white Thorn. Flame-coloured Campions.

Arnoldus Villanovanus hath these: Herb Trinity cures the wounds of Scorpions, and kills the Scorpions themselves. Let the sick drink one spoonfull of the juice of the root of Dwarf-elder with Wine, and it is an infallible remedy. Take of the roots of Cappars, Coloquintida, Worm-wood, long Aristolochia, Gentian, Bay berries, Yellow Ben. White Briony, of each alike, make it up with Honey. The Dose is the quantity of a Nut with Wife. Another. Take seeds of wilde Rue, Cumin, Garlick, Hazel-nuts, of each one dram, leaves of dryed Rue one grain and half, Myrrhe, Frankinganes, each one grain, white Pepper, Opium, each three drams, Opoponas, Galbanam, of each half a dram, make it up with Honey. The Dole is the resistance of Bean with Wine, John Arabi an Emplish man; the was in his citie the most skillfull Chiquington is any and affect in the could finde nothing more facilities by Emplish and Primes, he affected he could finde nothing more facilities he disagned the fling of the postploty then to disagned the thought of broad hard by Xxxx

the wound, and prefently to anoing the wound with the fame bloud. Celfus faith that those Phys ficians did some such thing, who were wont to keep the bloudthey drew forth of the arms of those that were stung. And this shall suffice for remedies against the stingings of Scorpions.

It any man chance to be bit by Rhasis Scorpion, (which we called Bunch't-back) the first day a small pain is perceived, but the second, straightness, heaviness, and sadness is seized on the tick: the colour of the body is divers almost every hour, and changing from green, yellow, white, and red; whence it may appear, that all the humours are infected, the place burns by the confluence of pain, and humour, swounding followes, and trembling of the heart, an acure Feaver and swelling of the tongue, by reason of humours melted and corrupting in the brain and falling down on the roots and muscles of the tongue: sometimes also the wine is bloudy by reason of the acrimony of the venomous matter, and green choler is cast forth by vomit, also by reason of the acrimony of the venonious matter, and green entoice is cart forth by vomit, also the gurs are tormented with a sharp and vehement pain. Almost all symptomes sall upon the nerves that can happen to them. Rhass bids care, all these things this way: First, incision being made on the place, and cupping glasses applyed, burn it with a strong actual cautery, then anoint the wound with the juice of wilde Endive, or with oyl of Roses, Barley water, juice of Appless, and with all cold things. If the belly be not soluble, make it so with a gentle Clyster, and let the pricent take this Thesical Control of the solution of the solution. and the juice of Blites, Nitre, and oyl of Violets, and let the patient take this Theriack. Take Opopanax, Myrrhe, Galbanum, Castoreum, white Pepper, of each alike, make it up with liquid Opopanax, Myrine, Catonium, Cartoleum, winte repper, of catendary make a piece of a millione hear, and formkled with Vinegar. Also foment it with water of wilde Lettice. The usual Theriack. Take the rind of the root of Cappatis, root of Coloquintida, Wormwood, round Birthwort, Hepatica, wilde Dandelion, dried, each alike make a Powder: the Dose is two drains; also sowre Apples must be eaten, For pain in the belly: Let him drink oyl of Roses. with Barley water, Citrals, Gourds, also give sowre Milk. For trembling of the heart: Let him take juice of Endive, or fyrup of Vinegar, or fyrup of Apples, with troches of Camphire, or fowre Milk the same way. If the wound be afflicted with great pain: Lay on a Cataplasm of Bole and Vinegar: for a defensative and for a sharp remedy, lay, on Euphorbium, or Caltoreum, Poly root drank with water, and a Rams flesh burnt, is profitable. Theriack salled Hascarina, first invene ted in the Province of Hascarum. Take leaves of red Roses iv. drams, Spodium ij. drams, Citron Sanders ij, drams and half, Safton j, dram, Licorice ij, drams, seeds of Citrals, Melons, Cucumers, Gourds, Cum tragant, Spike, etc. j, dram, Lignum Aloes, Cardamon, Amylum, Camphir, each j. dram, most white Sugar, Manna, each iij. drams, with the mucilage of Fleawort and Rose-water, what may suffice, make it up. The people of Hascarum was wont to draw bloud from the sick (sairh holy Abbas) almost till they fainted; then they gave sweet milk to drink, and water distilled from sowre Apples. Also they gave sowre Milk in great quantity. Thus the Arabians speak of this pestilent kinde of Scorpions that Nicander and all the Greeks were ignorant of, and that was too common in the Countrey of Hascarum. Non me will speak of Spiders.

CHAP. XI. Of the Name of Spiders, and their Differences.

The Name.

1058

HE Latine name Araneus, or Aranea, is in Greek, desixon, from the flender feet it hath, I or from its high gate, for the cobwebs it spins: Others call him woodallow, or Muscatricem; Kiramides, Megoor; Helychim, 5160v; the Hebrows, Acabitha, Acbar, Acabilh, Semamith; in Arabick, Sibth, and Phihit, Aldebabi, and Aldebani, as it is called by Bellunensis: the Germans call it Spinn, and Banker; the English, Attercop, Spider, Spinner; the Brabants, Spinh and French, Araigno; Italian, Ragno, Ragna; the Spanish, Arana, or Taranna; the Sclavonians, Spawanck; the Polonians, Paiack; the Barbarians, Koatan, Kerfenati; Isidore, 6.12. c. 12. faith it is called Aranea, because it is bred and nourished by the air: a twofold error: for if they live by the air, wherefore are they so careful to weave nets, and catch Flies? and if they were bred of the air, wherefore do they copulate? wherefore do they thrust forth little worms and eggs? but we will pardon the elegant Etymologer, because who makes a custome to play thus with words. There are many of these kindes, and all of them have three joynts in their legs:

A little head and body small,
With slender feet, and very tall,
Belly great, and from thence come all
The webs it spins.

Now Spiders are venomous, or harmless; of harmless some are tame or house-spiders, those are the biggest of all; others live in the open air, and from their greediness are called hunters or wolves : the smaller kindes of these do not weave; but the greater fort begins his web very sharp and small by the hedges, or upon the ground, having a little hole to creep into, and laying the beginnings of his webs within, observing whilest something shakes the web, then he runs to catch it. The venomous Spiders called Phalangia, are so venomous, that the place they wound will presently swell. These are of two kindes; for some are less, some greater; the less are vawill produce the product of the prod mountains; they are called Hypodromi, because they live under leaves. Gesnerus. It is a hairy creature, and breeds in the greater trees. The belly of it is moderately with incisions, that the cutting may seem to be marked by thred. Ælianus.

CHAP. XII.

Of Spiders that are burtful, or Phalangia.

TN Italy they know not the Phalangium, (faid Pliny) It is of fundry kindes; one is great like The difference to a Pismire, but much greater, with a redhead; the other part of his body is black, with of Phalangia white spots running between. The Pismire kinde of Action hath a smoky body, an ash-coloured and description neck, and the back as it were adorned with stars. Nicander his defent; Actius cals allnow; the on. Latines call it Venator; it makes a weak wound and without pain, but yet a little venomous: it is found amongst the Spiders webs, where (like hunters) it catcheth Flies, Bees, Horse-flies, Oxe-flies, and Wasps also, and (unless you will not credit Lonicerus,) Hornets too, and it spoils all that the nets can take and hold: that this is the same with Aristotles Pulex no reasonable man will deny. It hath a broad round volubilous body, the parts about the neck have an inci-

sion; and there are bred three eminences about the mouth. There is another Phalangium which Nicander Cals 1453 Actius fanor ; Elian, 1453 (from the likeness of it to the stone of a black Grape) it is round, and black, and shining, and globe-like, the feet are extreme short, as if they were imperfect, but it moves swiftly: it hath a mouth, but with teeth bred under the belly, and it were imperiect, but it moves initity: it nath a mouth but with teeth bred inder the beilty, and it moves with all the feet at once. Whether Aristotles Spider will bite, let the Reader judge. Truly it is not much unlike it, as Grevinus rightly conjectured. In this description, Actius, Alianus, Plinius, do almost agree with Nicander. Elian put long feet amis for small feet, and affirmed it to be only an African creature. 'Assess, were the same, unless it were distinguished by certain white stars and lines, that are fat and transparent. Only Pliny after Nicander made mention of this, as if it had been unknown to Aristotle, Galen, Actins, Elian, Avicenna. The blewish coloured Spider is worse than all these, called by Nicander midners; going on both sides with very long and tall feet: the Scholiast adds Aco, that is downy and high, not high downy, as Lonicerus translates it. Pliny faith hairy with black down, though I can hardly be induced to believe that the blewish Phalangium is hairy with black down. Nicander calls that Phalangium NCsnee, which others call ronnin, differing only from the red Hornet by want of wings, and is wonderful red. It is held far worse than the blew, though that by only touching doth communicate her venome, and break a crystal looking-glas (saith Scaliger) by running over it. There are two kindes of Tetragnathi, the worst is with a white line running along the middle of the head, and another across that. The milder or ash-coloured, white on the latter part, is of the same colour, and that makes very broad nets for flies on the walls. Plin. and Hermolans. But as Actine faith, Tetragnathur is one kinde of Phalangium, with a broad body, whitish, with rough feet, it hath two little rifings in the head, one upright, the other broad, that it feems to have two mouths, and four cheeks. Aclian faith there is a great number of them about the River Arrhata in India, sometimes deadly to the Inhabitants. In harvest time they are found amongst pulse, (when they are gathered with the hands) some small Phalangia are like to Bees Xxxx 2

rles, of a stame-red colour; such are those the English call Tayings, by eating whereof cattel are off-times killed; Phalangium breeds amoingst cates; and the Peach-tree-they call it security, by Nicander and Arisis; kwashings, by Diocorides, because it boldly strikes the heads of those that pals by it, when it descends by a thred, or fall down without it. It is a little creature in the shape of a Buttefly Phalana; it goes horridly with the head alwaies nodding, and a heavy belly, it is of a long body and a greenish colour; it hath its sing in the top of its neck, if it is nourished in the Peach-tree leaves, and hath wings like to some Buttessies; whence the Scholiast would infunate that this kinde of Phalangium is winged, which no man hath observed yet. Ponzettus and Ardonness described by Rabbi Moses, suppose it to be Crancaleptes, and the Tarantula; Gilbert an English man followed this error, in the Chapter of the Tarantula a sclerocephalus, or hard-head, little differs in sashing from the former; it hath a head as hard as a stone, and all the lineasness of its body like those little creatures that sty about candles,

The Theater of Infects: or.

a kinde of Phalanghith, Pliny cals it the downy Spider, with a very great head; which being cut, they say that two worms are found, which bound to women before conception in a crows skin, will keep them from conceiving; and this vertue of them will continue for a year, as Cecilius hath left is written in his Commentaries. We call the last Appulus, and commonly Tarantula, famous by that name from the Countries of Tarantula, where they are most frequently is borrows its name, we give you here the picture of its that

Scoletion is a long Spider, and varied about the head especially with some spots. There is also

was bestowed upon Pednias by an Italian Merchant of happy memory; where if you paint the white places with a light brown, and the black with a dark brown, you have the true spotred Tarantula; I know no man yet that described it as it should be. Ferdinandus Ponzettu doth faign it to be only with fix seet, and Ardonnus thinks the same, and saith more, that it hath a long tail. Rhasis cals it Tarantula, Sypta, Albucasis, Alfari, Rabbi Moses, Aggonsarpa, Avicenna, Sebigi, Gilbert an English man, Taranta; for he followed Ardonnus, who made two kindes of Tarantula's, one brownish, as we have pictured and the same a

Phalangium is not known in Italy, as we said out of Pliny, but now they are all almost found in the south Countrey, with great inconvenience to mowers, and hunters, as is manifest by difference. Ponsettus was wonderfully deceived, who in 1.3. c. 13. of the Scorpion, cals Phalangium a venomous Fly., It is a great creature (saith Alexander ab Alexandro) pestilent to touch. In summer when the sum is very hot, their string is venomous, at other times not. In the coldest Countrey's there are many Spiders, but no Spiders called Phalangia, or if there be any, they are free from all venome and infectiou. Tarantulæ lie hid in the chinks of surrowes that are not aware of them; wherefore the sum and wound with their teeth mowers or hunters that are not aware of them; wherefore the substants defend their hands and feet, when they go to mow, or to hawk or hunt, she makes her web like a net very silently, and all the little creatures she can catch, she provides for her supper. All the Phalangia bring forth in their net, that they make thick) and they do as it were suppose aggs in a great number, and when the young gows up it embraceth the dam and kils, her, and off times casts out the sire, if it can say hold of him, for he helps the dam to sit, and they bring forth 300. Belonius 1. sing, els. c. 68, observed little Phalangia in sandy grounds creeping up the Horses legs, (may be that is it the Germans call Stein spinnen) by whose continual bitings they suddenly sainteed, and staggering continually they consumed. Basilius saith that there are ten kindes of Phalangia, but he describes them not. Avicenna (I know not out of what Book of Galen) divides the Spiders Phalangia in to the Egyptian, the black, the bright red, that men call Raches, the white, Citron coloured, Grape coloured, Pismire-like, like Cantharis, Waspy, and mountainous. But both he, and all the Arabians describe them so solouled, to say no more) that there can be nothing more con-

fused in so great a matter. Lastly, to add all the kindes of Phalangia which we have seen or read of. I shall annex the Cretian Phalangium, you have here the picture of it exactly printed. It is of colour brown and associated, a smooth body, and hairy legs: near the mouth it is sented as it were with two hooked prickles, with which it bites and wounds. It lives as the Spiders do by Flies & Butterslies, & makes nets to catch them: she laies eggs, and softers them under her breast, whence the young ones are thrust forth, which stick under the dams belly, till growing elder they kill her. They dig a hole sir-for the bigness of their body; for as they are not every where of one colour, so they are not of the same magnitude. They dwell in a cave two footdeep, and on the outside they cover it with straw that the dust get not in. All these venomous Spiders are naturally so, for they suck not their poyson from herbs; (as some think from

their likeness) for they do not fo much as taste of them, nor yet from the malignity of their food. For they feed principally on Flies, Gnats, Bees, and they suck no ill humours

Of leffer living Greatures.

Grievous symptomes follow the bitings of Pismire Phalangium, for there followes a mighty Signs of the swelling on the part bitten, the knees grow weak, the heart trembles, the forces fail, and oft-bitings of times death succeeds. Nicander faith that the fick sleep so deeply, that they are alwaies asleep Phalangia. at last, and are in the same condition as those are that are stung by the Viper: Histories relate that Cleopatra fet one to her breaft, that she might escape Augustus without pain, nor is the wound deadly unless it be wholly neglected. Rhagium makes a very small wound, and that cannot be feen after it hath bitten: the lower parts of the eyes, as also of the cheeks wax red, then horror and fainting seize on the loyns, and weakness on the knees, the whole body is very cold & hath no heat. and the nerves fuffer convultion from the malignity of the venome. The parts ferving for generarion are to debilitated, that they can harly retain their feed, they make water like to Spiders, webs, and they feel pain as those do are stung with a Scorpion. From the sting of Afterion, men feem wholly without strength, their knees fail them, shivering and sleep invade the patient. The blew Spider is worlt of all, cauting darkness and vomitings like Spiders webs, then fainting, weakness of the knees, Coma, and death. Dysderi, or Wasp-like Phalangium, canseth the same sympromes with the blew, but milder, and with a flow venome brings on putrefaction. Where the Tetragraphis bite, the place is whitish, and there is a vehement and continual pain in it, the part it felf growes small as far as the joynts. Lastly, the whole body findes no profit by its nourifirment; and after health recovered, men are troubled with immoderate watchings. Actius: Nicander denies directly that the ash-coloured Tetragnathon can poyson one by biting him. The Cantharis like, or pulse Phalangium raiseth wheals, which the Greeks call odurlaises, the minde is troubled, the eyes are wrested aside, the tongue stammers and sails, speaking things improperly, the heart is as it were moved with fury, and flies up and down. The Vetch kinde produceth the same mischiefs, and cause Horses that devour them, and cattel to be very thirsty, and to burft in the middle. Cranocalaptes, faith Pliny, if it bite any one, death followes shortly after. But Active and Nicander affirm the contrary, and that the wound thereof is cured without any trouble almost at all. Head-ache, cold, vertigo, restlesness, toslings, and pricking pains of the belly follow, but they are all asswaged (faith Nicander) by fit remedies. Sclerocephalus, is like to this in form, and forces and effects the same things, as also the Scolecium. We said that the downy Phalangium drives away barrenness, if it be carried about one, but whether it be violently venomous, I know no man that hath determined it. The spotted or Phal ingium of Apulia, doth produce divers and contrary symptomes according to the complexion of him that is wounded, and his present disposition. For some laugh, some cry, some speak faulteringly, others are wholly filent, this man fleeps, the other runs up and down alwaies waking; this man rejoyceth, is merry and moves up and down, that is sad, slothful, dull; some think themselves to be Kings, and command all; some are sad, and think they are in captivity, and settered: lattly, as men drunk are not of one quality: so are these that are mad, some are fearful, silent, trembling; some are bold, clamo.ous, constant. This is common to them all, to delight in musical instruments, and to apply their mindes and bodies to dancing and leaping at the found of them. Lastly, when by continuance of the disease and the vehemency of it, they seem next unto death, yet when they hear musick they recollect their spirits, and they dance with greater chearfulness every day. These dancings being continued night and day, at length the spirits being agitated, and the venome driven forth by insensible transpiration they grow well. But if the Musicians upon any cause do but leave off playing, before the suel of this mischief be spent, the sick fall into the same disease that they were first oppressed with. We must admire this most, above other things, that all those that are stung with the the Tarantula, dance so well, as if they were taught to dance, and sing as well as if they were musically bied. (In Italy it was first invented, and custome hath taken it up to call such as are bitten, Tarantati, or Tarantulati.) Cardanus against faith and experience, denieth that musick can restore any that are bitten; yet we heard the same thing fell out at Basil, from Felix, Platerus, Theodore, Zuingerns, our molt famous, and dear Masters, and we read the same in Matthiolus, Bellunensis, Ponzettus, and Paracelsus. And if the sweet musick of pipes could help mad horses, and pains of the hips, (as Asclepiades writes) why may it not help those are stung with a Tarantula? Somethere are that assign to this difease, some I know not what small deity, as superintendent over it: they call him St. Vitus that hadformerly great skill in finging, he being called upon and pacified with musick, as he is the patron of musick cures them, so that men supersticiously impute that to him, which they should do to musick and dancing. Bellonius reports that the Cretian Phalangium induceth the like mifchiefs, and the pain and wound of it is also cured by musick. It is no wonder the Ancients described not these two kindes of Phalangia, because they knew them not, nor did the shew the waies how to cure their stingings. Dioscorides writes thus of the common bitings of the Phase langia. The symptomes that follow their bitings are commonly these: The place stung looketh red, but neither swels, nor waxeth hot, but it is something moist; when it growes cold, the whole body quakes, the hams and groins are stretched out, there is a collection made in the loins, they are often urged to make water, and they sweat with very great pain, and labour to go to the fool, and cold sweat runs down every where, and tears trickle down from their Xxxx 3

but not the fame words.

The cure.

darkned eyes. Assist adds further: They are kept waking, they have frequent erection of the vard, their head pricks, sometimes their eyes and their legs grow hollow. Their belly is unequal. ly fretched out with winds, and their whole body swels, chiefly their face, their gums, their tongues, and tonfils, they bring forth their words foolishly and gaping, sometimes they are troubled with difficulty to make water, they are pained in their secrets, they make wrine like water and full of cobwebs. The part affected is pricked and swels, (which Dioscorides denied hefore) and it is moderately red. So faith Action, from whom Paulus, Attuarins, Ardonnes, differ but little. Gal. 3. de loc. affec. c. 7. hath it thus. The bitings faith he of the Phalangia are scarce to be seen: it first affects only the skin, and from the superficies of it, it is carried by the continuity of the fibres to the brain, and into the whole body: for the skin comes from the mem-This is the inity of the indeed from the nerves and the brain; this is clear, because by presently binding of it on the farther parts, they are preserved from the venome that is near to them. In Zacinthus they that are bit by the Phalangia are otherwise affected, and more grievously, in other parts: their body is aftonished, weakned, trembles, and is very cold vomiting and convulsion followes. and inflation of the yard: their ears are afflicted with most cruel pains, and the soles of their feet. They use bathing for a reniedy; if the party recovered go willingly into bathes afterwards, or were by chance or by craft brought into them, by the hot water the contagion passeth over the whole body, and he perceives the same mischief in the whole body. Dioscorides writes the fame things in the chapter concerning Trifoly that smels like Asphaltum. The decoction of the whole plant easeth all the pain by fomentation, where Serpents have stung men, what man socver that hath ulcers and washeth himself in the same bath, is so affected, as he that was bit by a Serbent! Galen faith he thinks it is done by a miracle, Lib. de Theriaca ad Pisonom, if Galen did write that Book. But Elian speaks more miraculously, where he affirms that may happen to those that are found, making no mention of ulcers. And thus much for symptomes. Now for the cure.

The cure is particular or general. Physitians speak of but a few particular cures, because the

general is commonly effectual.

But Pliny fees down a remedy against the biting of the Phalangium called Formicarium, that hath a red head: to shew another of the same kinde to him that is wounded, and they are kept dead for this purpose. Also a young Weasil is very good, whose belly is stuft with Coriander, kept long and drank in Wine. A Wasp, that is called Ichneumon, bruised and applied, drives back the venome of the Phalangium Velparium, (faith Bellonius) not otherwise than as one living kils another, that is alive. For Ichneumon (faith Aristotle, is a small creature that is an encmy to the Phalangia; it often goes into their holes, and goes forth again, losing its labour. For it is a matter of great labour for so small a creature to draw forth its enemy greater than it self by force; but if he light upon his enemy preying abroad, he drags the Phalangium as eafily with him as a Pifmire doth a corn; and the more stifly he drawes himself back, the Wasp draws him on the more fiercely, and sparing no pains, doth bestir himself with all his might; sometimes when he is tired with too much labour, he flies away and breathes himself, and having recovered breath, he goes to feek for the Phalangium again, and striking him often with his sting, at last he kils him; when he hath killed him, he carries him into his own habitation on high, and there it renewes its kinde by litting upon them. Those whom the Tarantula strikes, are helped by violent and constant motion, but Celsiu on the other side commands those that are stricken by the other kindes of Phalangia, to be quiet and to move but little. But musick and singing are the true Antidote of it. Christophorus de honestis, bids presently exhibit Theriaca Andromachi. Also he gives Butter and Honey, and Saffron root with Wine. The Bezar of it are the green grains of the Mastick tree. Ponzettus lib. de venen. perswades to give ten grains of Mastick with Milk, or juice of the leaves of Mulberies, j. ounce and half. In the augmentation he cureth it with Agarick of white Briony, after sweating much they must be refreshed with cold and moist things, as with Poppy-water. Merula faith they are cured with finging, dancing, leaping, and colours; I will not contend for the first three, but I cannot see how they can be cured with colours, especially when as they that are stung are blinde, or see very little. He saith also that inhabitants and citizens are hurt by them, but strangers are safe and out of danger, which no man of a smal belief, or not very great saith can believe. Dioscorides appoints a general cure: First, scarifying must be repeated, and cupping glasses set on with a great fire. Abstract countries sels to sume the part stricken, with the shels of Hens eggs first steeped in Vinegar, and burned with Harrs-horn, or Galbanum,

Then you must use scarification, and draw fouth the bloud by sucking or cupping glasses. Or, which is safest, burn the place affected with an actual Cautery, unless it were full of nerves; for then it is best to set a Cautery on the neighbouring parts. Then sweat must be provoked with clothes laid on, or rather by gentle and long walking. Lastly, to perfect the cure, you must prove by averaged and interest before and long walking. prove by external and internal Medicaments, fuch as we here fet down, and the most commendable and most noted we mark with an Asterisk. Internal remedies out of Dioscorides: Take feeds of Southernwood, Annifeed, Cummin feed, Dill, round Birthwort, wilde Cicers, Cedar fruit, Plantain, Trifoly, feed of Minianthes, each alike, bruise them severally; the Dose of them feverally is i), drams in Wine, but if you joyn many of them together, drink iij, drams or iv, with Wine: also j. dram of the fruit of Tamarisk is effectual, with Wine, Chamepithy, and the

CHAP. 12. decoction of green Cyprus nuts with Wine. Some prove of the juice of River-crabs with accounts and Smallage-feed, and they promife it shall presently take away all pains. Also a Ly of the Fig-tree is drank against the bitings of the Phalangia: also it is good to dtink the fuit of the Turpentine tree, Bay-berries, Balm-leaves, the feeds of all the wilde Carrots, and of Coriander, the juice of Myrtle-berries, Ivy, Mulberry, Cabbage and Cliver-leaves, with Wine or Vinegar, one dram of the leaves of Bean Trifoly drank with Wine.

Decoction of Sparagus root, juice of Housleek, juice of Clivers with Wine, He also commends a Snail bruifed raw, and drank with Affes milk, * Also Balm-leaves with Nitre, and Mallowes boyled with the roots, drank often. The leaves, flowers, and feeds of the herb Phalangium, and the feed of Gith, the Decoction of Asparagus, Mock Chervil, and the juice of

Mullberries.

Out of Galen.

Take Birthworth, Opium, of each four aurei, roots of Pellitory of Spain three aurei, make Trochis as big as a Bean; the Dose is two Trochis with three ounces of pure Wine. The ashes of a Rams hoof drank with Wine and Honey. The remedies of Diophantis, against the bitings of the Phalangia. Take Birthwort four drams, Pellitory as much, Pepper two drams, Opium one dram, make little Cakes as big as Beans, take two, with two Cyathi of the best Wine.

Another that is better. Take feeds of wilde Rue, Rocket-feed, Pellitory, Storax, quick Brimflone, each fix drams, Castoreum two drams, mingle them, make Trochis as before with Snails bloud; the Dose is three oboti in Wine. Another. Take Myrrhe, Castoreum, Srorax, each one dram, Opium two drams, Galbanum three drams, Annifeed, and Smallage of each one acetabilum, Pepper thirty grains, make it up with Wine. Another. Take Myrrhe five drams, Spike of Syria fix drams, Howers of the round Cane two drams and half, Cassia four drams, Cinamon three drams, white Pepper one dram and half, Frankincense one dram and one obolus, Coltus one dram, make it up with Athenian Honey; the Dose is the quantity of a Hazel-nut with water, or with Honey and water. Apollodorus * remedies. Take wilde Cumin one acetabilum, bloud of a Sea-tortoife four drams, rennet of a Hinde or Hare three drams, Kids bloud four drams, make them up with the best Wine, and lay them up; the Dose is the quantity of an Olive, in half a Cyathus of Wine. Another. Take feed of bituminous Trifoly, round Birthwort, feeds of wilde Rue, Tare-feed dried in the Sun, each fix drams, drink them in Wine, and make Cakes, four drams weight; the Dose is one Cake, Gal. 2. de Antid. where he hath collected many remedies from Authors.

Out of Actius and Ægineta. Take quick Brimstone, Galbanum, each four drams, bitter Almonds blancht, juice of Lafe-wort two drams, of Assa four drams, mingle them with Wine and Honey, and drink them, also lay them on thus. Another. Take Ameos two drams, Flower-de-luce one dram, or of St Johns Wort, or bituminous Trifoly, drink them in Wine. Or take Annifeed, wilde Carriotfeed, Cumin-feed, Gith, Pepper, Agarick, each one dram, drink it. Or take leaves of Cyprustree, or the Nuts bruifed in Wine and Oyl one Hemina, and drink it.

For this end he prescribes Bay-berries, the herb Scorpions graffe, Serpolet, Laserwort, Calaminth, Chamæpitha, by themselves, or with Rue and Pepper. Another. A bunch of Mints boyled in fresh Posca, let the sick drink two Cyathi: Also Germander, Chamæpithy, white Thorn, and Peniroyall in decostion are good. Also a Ly, and juice of Ivy with Vinegar. Afclepiades used these. Take seed of Sphondylium dried, Calamint, each alike, bruise them, and drink often in a day two Cyathi of Wine with them. Another. Take juice of Laserwort, Daught Minter Calamint, each clibe washe in monthly line can be seed as a possible washe in monthly lines and the possible washe in the p cus-seed, dried Mints, Spikenard, each alike, make it up with Vinegar; the Dose is one dram: take it with Posca and Wine, four Cyathi, and presently go into a hot Bath; when Laserwort is wanting, take the double portion of pure Asa.

One that is better. * Take of Cenchryus, seeds of wilde Rue, Pepper, Myrrhe, wilde Vine, of each one dram and half, Cyprus root one dram, make a Confection; the Dose is one dram, with four Cyathi of Wine, and one Cyathus of Honey. Also the eating of Garlick is good, as also a Buth and Wine, and such things as help against Vipers stingings. Paulus repeats the same remedies, and Theban Cumin, or feed of Agnus Castus or leaves of the white Poplar-tree drank in Beer are very effectual.

Out of Nicander. Rolin of the Turpentine tree, Pine or Pitch-tree, drank or swallowed, is exceeding good, which Gesner and Bellonius say they searned by experience, to be true.

Out of Avicenna. The Myrtle-tree and the fruit of it, Doronicum, Mastick, Assarida, Dodder and its root, the Indian Hazel-nut (which is Theriac for this disease) white Bdellium, all of these drank with Wine. Take roots of Birthwort, Flower-de-luce, Spike Celtica, Pellitory of Spain, Daucus, black Hellebore, Cumin, root of Daffodil, leaves of Winter Wheat, leaves of Dogs-tooth, Pomegranate tops, Hares Rennet, Chamon, juice of River-crabs, Storax, Opium, Carpobalsamum, of each one ounce, beat all to powder, and make Troches, the weight of one aureus, which is the Dose of them. Also give in Wine the decoction of the leaves of bituminous Trifoly, of the Cyprus Nut, Smallage-feed. Moreover give to drink, Pine kernels, Ethiopian Cumin, leaves and rinde of the Plane-tree, seeds of Siler Montanum, black wilde Chiches, feed of Nigella, Southern-wood, Dill, Birthwort, fruit of the Tamarisk, for all these are very good. Also the juice of wilde Lettice and House-leek are commended,

The decoction of Cyprus Nuts, especially with Cinamon and River-crabs juice, and juice of a Goose: Also the decoction of Sparagus with Wine and water.

Another. Take Birthwort, Cumin, each three drams with hot water: An approved Therias. Take Nigella feed ten drams, Daucus, Cumin, each five drams, Cyprus roots and Nuts, each three drains, Spipenard, Bay-berries, round Birthwort, Carpobalfamum, Cinamon, Gentian, feeds of Siler Montanum, and of Smallage, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. Confection of Asa. Take Asa factida, Myrthe, Rue-leaves, each alike, make it up with Honey; the Dose is one or two drams with Wine.

Out of Abstreus, Lullus, Albucasis, Rhasis, Ponzettus. Take white Pepper thirty grains, with one spoonfull of Wine distilled with Balm. Lullus. Take dry Rue, Costus, wilde Mints, Pellitoty of Spain, Cardamum, each alike, As fatida one fourth part, Honey what may suffice, mingle all, and make it up; the Dole is the weight of an Hazel-nut in drink. Albucasis. A Hens brain drank with a little Pepper in sweet Wine or Posca. The decoction of Cyprus-nuts with Wine A Theriac against the bitings of Phalangia. Take Tartar fix drams, yellow Brimsone eight drams, Rue-seed three drams, Castoreum, Rocket-seed each two drams, with the bloud of the Sca-tortoile, make an Opiate; the dose is one dram with Wine. Another. Take Pellitory of Spain, round Birthwort, each one part, white Pepper half a part, Horehound four parts, make it up with Honey; the Dose is one dram. Another. Roots of Capers, long Birthwort, Bayberries, Gentian root, each alike, drink it with Wine. Or drink Diasta with strong Wine, and Cumin, and Agnus Castus seed, Another. Take Nigella seed ten drams, Daucus, Cumin, each five drams, wilde Rue-seed, Cyprus Nuts, each three drams, Indian Spike, Bay-berries, round Birthwort, Carpobalfamum, Cinamon, Gentian root, feed of bituminous Trifoly, Smallage-feed, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. Rhasis.

Out of Pliny, Celsus, Scaliger. It is good for those that are bitten by the Phalangium to drink five Pismices, or one dram of the Roman Nigella feed, or black berries with Hypocistis and Honey. Also Marish Smallage and wilde Rue, are peculiar against the bitings of the Phalangia: Also the bloud of the Land Tortoise is good, juice of Origanum, the root of Polymonia, Vervain, Cinquesoil, the seed of Garden Onyons, all the kindes of Housleek, roots of Cyprus, Turnsole with three grains of inice of Ivy-root, in Wine or Posca; also Castoreum two drams, in Mulsum to cause vonit, or in juice of Rue to stop it. Also Agnus Cassus seed two drams: Apollodorus that followed Demo-erates,, calls a kinde of herb Crocides, by the touch whereof Phalangia die, and their force is abated; the Mat-rush-leaves next the root, eaten do prosit. Pliny. Take wilde Vine-berries, Myrrhe, each alike, drink them out of one Hemina of fod Wine. Also the seed of Radish, or root of Darnel must be drank with Wine. * Celfus. But amongst many other remedies that are proved, one Antidote is due to Scaliger, who was the ornament of our world and age; the form of it is this. Take true round Birthwort, Mithridate, each two ounces, Terra Sigillata half an ounce, Flies living in the flowrs of Napellus, 22. Citron juice what may ferve turn, mingle them. For faith he, against this venome or any other bitings of Serpents, Art hath scarce yet found out so effectuall a remedy. Scaliger. Juice of Apples drank, or of Endive, are the Bezar against the bitings of the Phalangium: Petrus de Albano. These are the most approved outward remedies. Five Spiders putrefied in Oyl and laid on, Afles or Horse dung anounted on with Vinegaror Posca: Take Vinegar three sextarii, Brimstone a sixth part, mingle them, soment the place with a sponge, or a bath, the pain being a little abated, wash the place with much sea-water: some think that the stone Agates will cure all bitings of the Phalangia, and for that reason it is brought out of India and sold dear. Pliny. Fig-tree ashes with Salt and Wine, the root of the wilde Panace bruiled, Birthwort and Barley-meal impassed with Vinegar, water and Hone, and Salt for a fomentation. Decoction of Balm, or the leaves of it made into a Pultis and applyed; we must constantly use hot Baths. Pliny. Open the veins of the tongue, and rub the places swolne with much Salt and Vinegar, then p. ovoke sweat diligently and warily. Vigetius. The practicall men mightily commend the root of Panax Chironia. Theophrastus. Anoynt the wound with Oyl, Garlick bruifed, or Onyons, or Knot-graffe, or Barley-meal with Bay-leaves, and Wine, or Wine Lees, or wilde Rue, lay it on with Vinegar for a Cataplaime, Nonus. Take live Brimilone, Galbanum, each four Denarii, Lybian juice and Euphorbium, each alike, Hazel-nuts pild, each two drams, distolve them in Wine, and with wine make a Cataplasme, also inwardly it helps much. Flies bruised and laid on the part affected. Also a Barbel heals the bites of a venemous Spider, if it be cut raw and applyed to it. Galen. Anoynt all the body with a most liquid Oyntment with wax. Foment the part affected with Oyl, wherein bituminous Trifoly hath been soked, or with a Sponge and hot Vinegar, very often. Make also a Cataplasme of these that follow, namely, with Onyons, bloudwort, Solomons feal, Leeks, Bran boyled in Vinegar, Barley-meal, and Bay-leaves, boyled in Honey and Wine. Make them also with Rue, Goars dung with Wine, Cyprus, Marjoram, and wilde Rue with Vinegar. Asclepias his Plaister. Take feed of wilde Rue, Rocker-seed, Staves-acre, of Cenchrus, Agnus Castus, of Apples, Nuts, of leaves of Cypress, each alike, bruise all with Vinegar, and with Honey make a Plaister. Action. Lay the decoction of Lupines upon the place affected, the Eschar being first taken away, then

CHAP. TOL anount is with Goose greate, wilde Rue, and Oyl in the hot Sun or by the fire, or make a anount it was Barkey pap, and broth of Lupines, Oribasius. An Indian Hazel nut smeared on carapianise of the Phalangia: Oyl of Worm-wood, and the milk of Figs anounted on, doth profiq very muchs Avicenna. Of hot ashes, Figs and Salt with Wine make a Plainter: Alfo it is convenient to hide a great boll in fand or hot ashes, and by that means to sweat with Antidotes. Rhafin Goats dung must be dissolved with the Pultesles, and laid to the part affected. Kiranides. Lay on often cold Irony Regries de Albano. Foment the place with juice of Plantain daily, Hitdegard. Oyl of artificiall Balfam is exceeding soveraign. Enonymus. A Fomentation of the branches and stalks of Masterwort must be continued, or let him drink Vermentation Wine, and lay it on outwardly, first bruited. Turneifer. Bruife Rue with Garlick and Oyl and lay it on. Celfus. You shall lastly finde divers such remedies in Pliny and Dioscorides, fo digested into order, that they rather require our filence, than our curious, and unusefull repetition. Of this therefore thus far.

> -Now let us see " That Spider with which our mindes well agrees Who sits within the midst of s Net to watch Where the East winde blowes, it shakes, he doth catch Flies that but touch his Web, none can him match.

CHAP. XIII.

Of the tame or house Spider.

Mongel Infects, though many may be found (as Pling, Calius, Curio the second, out of A whom we have fetched many of these things, say rightly) that may exercise great wits, yet the nature of Spiders is worthy to be admired in chief, and is apparent by their curious working, as any reasonable man will judge. Mristotle the greatest diver into Nature, saith that this is the most magnificent, and wifest of all Insects. And Solomon himself at whose wifdome all the world admired, amongst those four Animals that exceed Philosophers for their knowledge, reckons up the Spider, dwelling as he faith in Kings Palaces, and weaving Webs that man cannot do the like. The Poets faign that the Spider was once a Lydian Mayd, that Minerva had taught to work with the needle, and weaving all cutious artificiall work: But the was grown to proud of this skill, that the denyed that ever the learned this of Pallas, and the proceeded to farre in arrogancy, that the boldly challenged Minerva to work with her in all these Arts: Wherefore Pallas disdaining her pride, came, and sharply rebuking the Mayd for her infolence, brake all her fine wrought works with a Wand: At this the Mayd was fore abashed, and thought to have hanged her self; but the Goddesse pitying the poor Maids condition, would not luffer her to do to, but as the hung by a very fine Cord, the changed her shape into a Spider.

> Pallas was angry, and in wroth she said, Yet live and hang thou proud and haughty Mayd, And that thou mayle fill suffer 'tie my minde, The same Law lasts for thee and for thy kinde.

But they that interpreted this a Fable or a History, fay that Arachne found out the art of spinning, sowing, and weaving hemp, taking pattern by the Spiders. And this needs not seem strange to any man, since the Swallowes found out the Art of plaistering, and for Oculists, Eagles for building, Hipporamus for letting bloud, Ibis for giving Glysters, Goats for Antidotes, so Tortoises, Weasels, Storks have instructed us.

To praise the Spider as Lought, I shall first set before you the riches of its body, then of The praise of its fortune, laftly of its minde. If you consider the matter of it, it is light, partaking much of the house spi-Air and Dire (that are the most active and noblest Blements) but it hath little of earthly dregs from the boand gravity. Confider the figure it is wholly round and orbicular, or at least Ovall, that dy of it is next unto it. The substance of it is thin, transparent, subtile, and though sometimes by the abundance of plunder and prey, it becomes so eram'd, that it growes as great as a Walnut, and (if Cardan erre not) as great as a Sparrow fometimes, yet if you fee it hanging in its Web, against the lighe, it shines all through like a Chrysolite, and makes reflexion of beams most gramfull to the eye. It hattrebe fame colour that Ovid writes that Lovers have, that is, pale; and when flie flicks aloft with her feet cast every way, the exactly represents a painted starre. As if Nature had appointed not only to make it round like the Heavens, but with rays like the Stars, as all they were alive. The skin of it is fo fost, smooth, polished and neat, that she precedes the lostest skin'd Mayds, and the daintiest and most beautifull Strumpers, and is to Sear that you may almost fee your face in her as in a Glasse; the thath singers that the most

gallant Virgins defire to have theirs like to them, long, flender, round, of exact feeling, that there is no man, nor any Creature that can compare with her: the hath feet not numberleffe, as the Scolopendra, nor is the without feet, as some Insects are, nor hath only fix seet, as those that want wings have, but eight feet, which number is next to the most perfect number, as all men know. These legs also are made in a sesquitertiall proportion, which is most admirable and yenerable; so that though the latter feet be alwayes shorter then the former, yet they hold fill their proportion. Many Philosophers who hold that Spiders are blinde, are blinde themselves, for were they blinde, how should they make choice of those places that are most convenient for to pitch their nets, and who should lead them to fasten one thred to another, and should know how to mend their Webs when they are broken by accident? when as also the tame and familiar Spiders will come from a distance to catch a Flie that toucheth bur the fides of their threds, they are the more bold to purfue them, and will take them as it were from hand to hand, as we have often feen. Truly they are blinde at noon-day, and understand nothing, who fay, that Spiders are blinde. In this Spider there is no poylon nor hurt, for if it bite it is without harm, and it is rather tickling then painfull. Also their very Carkases, and their bodies, their eyes, their excrements, are good and usefull for many diseases, as we shall make it plain enough when we speak of their use. I know not what it was that made Pennius so slighted when he thought of eating them; for he knew a Noble English Lady, and Phaerm a Physician, that did often eat them without any hurt at all. For the truth is, Spiders are free from poyfon, and are very good for ones health. But because it seems so horrid a Creature to some people, that the very fight of it makes them fly from it, I rather attribute that to their melancholy apprehension, tendernesse and distemper, than to the ill form of the Spider, Nature hath used no lesse elegancy and bounty in the Spider, then she hath done in the Butter-fly, and Flie, and it is no light difease of the minde to disdain so beautifull a work, and to be afraid of a Creature that weaves so curiously. Lastly God hath given a wonderfull disposition and nature of the skin to so wonderfull a body; for it doth not only once a year (as Vipers do) but every Moneth if the be well fed the changeth her skin, and recovers a new one that is more curious, Also it is of so excellent a temper, and so frugall in its diet, that in a wholesome place, where The praise of the canget any provision, the will live alwayes. I think that to be the chiefest good amongst

The Theater of Infects : or.

the house Spi- the goods of Fortune, or rather Fate, that they carry the matter of their Webs in their belder from the 1y, and they are so well stored with it, that a Spider can draw forth innumerable threds and goods of For-weave them, and catch if need be, a hundred Flies, and have Nets enow to wrap them in. And though they, have not meat in a Granary as Pismires have, nor ready and growing up, as Bees have, but they live only upon food they light upon by chance, yet by Gods providence the prey comes flying by that fulfains them, and oft times they grow fat with plentifull dishers that they take by holtility. Further, I should think it no small part of good Fortune given to the Spider, that when the is fatisfied with the troublesome fare of the Court, yet the never hath the Gout. You have heard that Solomon of old affigned her a place in Kings Palaces, that she might be a pattern to his Courtiers, to labour, to be ingenuous, wise, frugall, and vertuous. There beginning her Webs the workt with hands and feet, and never need to goe a hawking for Flies, the feared no affaults, no treachery: and briefly, this most wife creature did bear rule in the great Palace of that great King. After him arose bad Princes, that were idle, followed ill counsell, that came to ruine, it is hard to say, how hardly they used the poor Spider, and commanded forthwith to sweep her down with beesoms and poles, as if she had been a night-robber, and to tread her under foot, and to kill her. Prefently Furies ran and swept down and spoyled all those learned works that had been wrought, so that she could hardly escape the quick-sighted beesomes of those lazy devils. She was most miserable now, lest all alone in so great abundance, and in so large houses, she could not finde one corner to be in. And by the Kings example, the Nobles and rich men drove out this Mistresse of labour and vertue, and they would not suffer one thred to remain, that was a Token and Ensign of her great wisdome. She when once she went abroad to travell (as the Fabulist wittily saith) the Gowt by chance came to keep her company, though she could hardly hold pace with her, but with great toil. When as now they had travelled one dayes journey, at night they took counsell to try their Host, but they were of different opinions. The Spider going into the City, got into the house of a rich Gitizen, and so soon as she began to work and to spread her Tapestry and hangings, (by the example of the bad Kings) he forthwith hates her, and drives her out, and the same night he expos'd her to the rain and open air. But the Gowt being lame, when he could go no further, got into the first house of the Town, and could scarce intreat to be harboured in the poorest Cottage there; and when she lay down, she found misery enough; she had for supper brown bread that her stomach rose against, and a little herbs, scarce any falt upon them, and water was fetcht from the next pond, in an earthen Pitcher to quench her thirst; being thus entertained, she required a bed to ly on, she could get none but straw or the planks to ly upon, and so she lay down in picifull misery, lamenting and sighing: But alas how wretched a thing it is for tender limbs, and that cannot endure to be touched (as faith Hippocrates) to ly upon such a hard bed and pillowes. The next morning the Spider and the Gowr mer again; the Spider complained terribly of the incivility and rudenesse of the rich Citizen, and the Gowt on the other fide complained of her Hosts poverty and poor fare, showing

CH A P. 12. the black and blew marks the hard lodging had made in her skin; and when they had a while taken deliberation about its they both agreed upon this that the next night they would change their hoft; that the Spider flould go to the poor cottages, and the Gowr to the Kings palaces and rich mens houses: the Sowt not immindful of this agreement, went to a very rich mans house, and lay down at the feet of a very well fed Matter, that was very rich, and so soon as this kinde host perceived her, with what humanity, embracings, and cheerfulness did he entertain her! down pillowes were laid under her, all the stools and chairs in the chambers are filled with the best feathers, and cushions laid upon them; the Kitchen was very hot, and all officers at work for provision; the table is spread with all dainties, and the cups fill'd with Wine; fat and cramb'd Capons, Pheafants, Partridge, Peacocks, Quails, Turtles, that feed on figs and grapes, and those birds that have two hearts to fet them forth come flying to the table: Turbots, Gilt-heads, Sturgeons, are not worth speaking of. The shell-fish of Campania with purple juice, and Oysters from Abydus, and whatsoever the whole ocean can afford, are ready. The Wines, are white, black, red, purple, sweet, delicate, sharp, Cecubum, Falernum, Chium, powred forth in full bouls. To say nothing of the second table brought from Tarentum, and the dainty cates, with Rose, Violet, and lacinth coloured. Lattly, no delights, dainties, pleasures, or joyes are wanting, that the rich Gowt, (for the is daughter to Bacchus and Venus) with her fifters, the hand and knee-gowts, may be entertained delicately. The Spider also as good hap was, light upon a poor Cottage inflead of a rich palace, and there she teacheth man and wife what duties are useful for both, and stats her self with care. But perhaps some man wil object that they can finde no good fortune in this, but only the Spider may be commended for changing her habitation and her holt; but it is very fortunate for her; for she lives not only safer, and more at rest, but she doth not from the roof as from a warch-tower, behold any more adulteries, gluttony, riot, prodigality, lasciviousness, plays, dancings, wantonness, dicings, cardings, and lastly thole vanities, and beattliness, that never enter into poor mens cottages, whereof the knew her felf to be guilty, whileff the lived in Courts and Palaces of great men, who fo foon as they had driven forth the Spider, (the miltress of labour and frugality) were presently seised on by the Gowt, and not only so, but all luxury, dissembling, lying, flattering, pride, entred into their palaces, or rather into their ears, eyes, and mindes, and polluted them with all wickedness and companions of all mischiefs: were it not better for Kings to allow this good, frugal, wife, harmless little creature a room in their large chambers, than to hearken to, and to reward to much such pick-thanks, and Court-flatterers, and voluptuous persons, who by their wicked counsel and example will quickly corrupt the best men? I know not whether I Prayles of the were best commend the Spider for the gifts of her minde, as wisdom, justice, valour, tempe-Spider from rance, humanity, love of poverty, love of works, sufficiency, cunning, cleanlinesse, and her other the sites of ber vertues; or else her admirable art and skill in weaving her Webs. Her wisdom appears in minde, that, that when the Rivers are like to rife higher, and drown her house, the removes to some safer place. In fair weather when the Flies sly about, they weave not, but wait on their prey: she runs away at the least touch of any thing that troubles her, and hides her head in her hole (as Vipers do) that the may feel the leffe pain, and that her body being hurt, (which is easily healed) yet she may preserve her head that governs the whole body. Who taught them to know this? Did any Chaldean teach them, by the situation and position of the Stars? No indeed, but the Spider hath a certain divine wisdom given her, as the Poet sang truly,

Her body moves by vertue of her mindes Diffused in every part

Moreovers o foon as they see an enemy faln within their nets, they do not presently wound him, or bite him in a hostile manner, but they kisse as it were and tickle him, until they have all smeered him over with a clammy web setcht out from the hinder parts with their hindermost feet, and have as it were bound him with bands, taking away from him all power of relitance, Aying away or moving; then that three being faitned to their web, they run to the centre to observe, if any new prey may fall within their nets: and thus sometimes you shall see ten or tweney Flies hung up on a line on high, and the Spider will take them one after another, breaking their line they hang by, and fallned to one of the hinder legs, will carry them to the centre of her work, and there devour them: the feeds on nothing but the juice of Flies, and when the carkass is dry and void of all juice, she throws it down as an useless burden to her web. Moreover, because the female is something greater than the male, therefore she hangs under and observes, for fear the small creatures should perceive and take heed, but that they may fall unawares into her net, for by reason of her greater body she is not so fit to catch her prey. But the male is more active, and lies a top, as if he were otherwise imployed, or else seeing all things from a very little hole in his net, he conceals himself that he cannot be seen. And when any by chance comes to his lot, how vigilant is he and intent after his game? for he will not let his prey escape, but he runs from the uppermost line to the lowest suddenly, and when he hath his belly full, he laies up the rest of his provant, and hangs them up by a thred to suck them another time. And when as by age the webs have lost their clammy quality to hold fast, the Spider either new Weaves them, or elle beglewesthem anew and repairs them. Her work ended, the either contains her self in her hole, or watching above the holds the thread drawn from the centre, as it were

CHAP. 12.

with her hands, whereby she can go and come to her nets and retreat at pleasure, and also (if any prey be taken) she perceives it by the motion of her web. But to be more certain, before she comes down, she drawes her thred back sometimes, that she may know how it is by motion and weight. Then first she hashnesh to the centre; which the ensured little creatures either seeing or conjecturing, do lie shill, selt by motion they should distover themselves and be more enrangled; yet they cannot deceive the Spiders who with feet and eyes perceive their prey, and run swiftly unto it suddenly. But good God, what and how great justice is seen amongst spiders? None of them robs another of his wife, none of them causes upon anothers house; each of them lives by his own labour and possessions, and they hold it unlawful to break the bands that belong their neighbours;

But men are not fo just, oh pity it is vo fee Flow covetous they are, lust reigns in each degree: Adding house's o house, both feas and lands, And more worlds they fain would have in their hands.

Farther, they do not pitch their nets for such creatures as are good, and useful, but to catch Hornets, Oxe-flies, Horie-flies, Waips, Drones, Breezes, Gnars, common Plies, which are to us like bawds, theeves, flatterers (as the Comedian speaks) that breed us many inconveniences, but are no way fit to do us any good. Moreover, the dares (as the is very valiant and magnanimous) hunt after the Lizards young ones, whom the prefently involves in her net, as they make refiftance, then laying hold of both their lips with a deadly biting, fire holds them fo fall, that The makes them dye under her. And lastly like another Caem the drawes them backward dead into her lurking place. And if by chance in this great contest, she findes her nets broken or folded together, the prefently repairs, unfolds, and spreads them anew with great dexterity. Farther yet, there is a fierce and everlasting fewd between the Spider and the Gerpent : for if at any time the Serpent feeking shady places, fals upon some places under a tree where many Spiders are, one or other of them will fall right upon the Serpents head with his ree, and the will so beat upon his brain with her mouth, that he will make a noise and his, and be so vertiginous, that in this miserable condition, he can neither break her thread, nor escape from her. Nor is their end of this combate, till the Spider have destroyed thim. Let the Romans be filent concerning their battails on the stage, and the cruel combares of Elephants, when a little Spider dares fight with a horrid and wan black Serpent; and not only to fight with him, but to triumph over him, and carry away the rich spoils of her victory. Who would not admire so great force, to great weight, to tharp and hard bitings, and almost incredible trength, in to small a body, and of no confideration, having neither bones, nerves, flesh, and hardly any skin? this cannot proceed from its body, but its spirit; or rather from God'himself: In the same fashion they enter the lifts with land and water Toads, and kill them in fingle fight. For not only Play and Albertus the Philosopher mention this, but also Erasmus in his Dialogue of friendship, relates, how a certain Monk, who flept with open mouth, and had a Toad hanging at his lip, escaped by affiliance of the Spider. Oftenines also shey enter the stage with the winged Hornet, that hath a strong sting, and sibres atmost of horn, who straight by main sorce breaks through their webs, as great rich men do with the Laws, yet at last he is wrapt in a more tenacious glew, and pays for breaking open choir houses, and conquer'd in single duel, he becomes subject to the Spider.

I must not passe by their temperance that was once proper to Man, but now the Spiders have almost won it from them. Who is there now, (if age will let him) who will be content with the love of one? and doth not deliver up himself body and soul to wandring lust? But the Spider so soon as they grow up, choose their mates, and never part till death. Moreover as they are most impatient of corrivals, so they set upon any Adulterers that dare venture upon their Corrages, and bire them, and drive them away, and oft-times justly destroy them. Nor doth any one of them attempt to offer violence to the female of another, or to affault her chaftiry. So great command have they of their affections, so faithful and entire are they in their conjugal love, like Turtles. If you respect their honshold government, what is there more frugal, more laborious, or more cleanly to be seen in the whole world? For they will not suffer the seast thread to be loft, or placed in vain; and they ease themselves by interchangeable work; for when the female weaves, the male hunts: if either be fick, the other supplies both offices, that they may deferve alike. So sometimes the semale hunts, and the male weaves, and this at anytime when the one wants the others affiliance; for we cannot think them so void of mutual love, that living fo faithful in Marrimony, the one should not fend a helping hand to the other recessives, and so by mutual courtesse they continues their friendship amongst themselves. The semale at home being now learned from her Parents to spin and weave (as she is worn to do with us) she because her washe. gins her webs, and her belly contains aff the matter of them, whether it be for that at a cettain time her entrails are so corrupted (as Democritus said) or that there is a kindt of woolly fruitfulnesse in her as there is in the Silk-worm. Yet Arifful will have the matter to be with one, like a thin shell which is drawn in lengths by spinning and weaving; or after the manner of those that shoot our their brillier, as the Porcupine. However it be, they lose nor the

least end of a thred, but they undertake all by providence. Their love to their young ones no man can rightly describe, but he that loves his children himself. For by mutuall incubation, they folter their Egges, and raise up and increase the hert of them; and thoule oftrimes they produce three hundred young ones, yet they bring them all up alike to labour, foaringnesse, discipline, and weaving, and love them all alike. I have oft wondred at their cleanlinesse, when I have seen those that were weak and sick to go down to the bottome of their Web, out of their dens, and exonerate their bellies, left by the filth of their excrements their houses, or Web, or threds should be polluted. And these things shall suffice for their civill and occonomicall vertues. Now let us proceed to their art of making Nets, which is so offensive to Pallas, for the Scholar exceeded her Mistris in the curiosity of her work. First therefore we shall consider the clanumy stuffe that drawes like Bird-lime, which loseth not its tenacioninesse by drinesse nor by moysture, we said from Pliny, that she drawes this fluffe out of her belly. But feeing that the males weave also, I think on good grounds, with our friend Bruerus, that it is drawn out of the entrails behinde. And fince it cannot be exhausted, we may wonder at the infinite and endlesse power of God, and adore it, for it were next to madnesse to assign this to bodily or naturall causes. Those Spiders are held to be the best Artificers that work in Autumn, and are called Holei; they draw a thred that is smaller then any linnen or filk, and farre lighter, and so pure (saith Alianus) that the whole Web wrapt together, will fcarce make one thred as great as a linnen thred though it be never fo small. Edwardus Monimus described these, both Males and Pemales, very elegantly Heptam : 1.7. in these words:

He hunts at home,
But he doth weave within her tender loom,
And jugler-like, he from her belly cafts
Great clewes of yarn and thredomhich while it lafts
She works to make her Nets, and every part
She frames exactly by Dedalian art,
Her Web is fastened to the beam, the threds
Are parted by sit lines as severall heads,

She works from Centre to circumference;
The Web is made on both sides for desence,
Pervious lest when the East-winde doth set
Strong, it might break this tender worke, and set
The strongest Flie may be held in this Net.
No sooner can a Flie but shake her thread,
The male runs to the Centres and his bead
Peeps sorth to catch what comes, so is he sed.

The variety of their Nets is so great, that it is not called amisse, the Goddesse of a thoufand works; some of them are looser, some thicker, some triangular, others square, some Diamond figures, for the commodity of the swiftnesse of hawking: But that which is round is commonly wrought between two trees, or Reeds, and oft times in divers windowes, hanged fall with ropes, and fail-yards. Good God, what great reason, judgement, art, what admirable wisdome and beauty she shews! Truly we may not suppose amisse, to say that Enclides learned to make his figures from hence, and Fishermen their Nets; for from whence else could they fetch such an example of so curious and laborious a Mistresse? So finely is her work besmeared, and made so round and exact, and so equally ballanced, and she doth so work her body in place of a weight and spindle, that she may well be compared with Mineron, but that the comparts for makes me asraid. Also the work is so firm, though it appear so weak, that it will hold Homers, endure force of windes, and dust being fallen into it, it rather yeelds than breaks or is hurt. The manner of her Net-work is this: First she drawes her semidiameters to the places circumabient, most fit for her work, then with no compasse, but by a naturall skill of her feet, she makes 44 circles with her thread from the center to the circumference, by equall parts more distant one from the other. Moreover that is worth our knowing, as also it seemedmost admirable to our most learned Turnerus and Bruerus, namely, that those Spiders when they are purposed to fasten a thred from a high beam, in a right line to the earth, they hold a little stone with their feet, and then by degrees they let themselves down by a three doubled thred, that the angle at the earth may answer the angle above by the beam exactly. But that above all the rest is worthy of admiration, how they fasten the first thred on the hither side of the River, and the second on the farther side, whereas Nature hath not taught them to sly, or to swim; I much doubt whether they leap over or not. The second peases in weaving they deserve, that build on the rafts of houses, and other Field-spiders, who upon the grasic weaver Net, that is broad, thick, and plain, and it is a Net indeed, spread, forth like a sayl, or sheet. In the work of these Spiders, if you consider, the woul, the skains of yarn, the trendle, the shittle, the comb, the woof, the distaste, the web, either you will see nothing, or you must see God insensible, yet really persorming all these things and truly in spinning, they go far before the Egyptians, Lydians, Penelope, Tanaquil, Amelria, Remes Claudianas Sabina, Julia, and the Queens of Macedonia, that were wonderfully skilled in spinning, because (beyond all ordrdinary reason and art) no threds being drawn overthware, they make a solid and tenacious Web, of a straight continued long thred. Their work being ended, they smeer it over with a birdlimy glurinous spittle, by the touch of which alone the prey is entangled, and payes for its blindenesse and want of foresight. The colour of her Web is aereall and transparent, or rather no colour, which is the thing deceives the Flies that are not aware of it, and they that see best hardly escape it. For had it but any perfect colour, they would think what need they had to avoid it, and fly farther from it. The most ignoble

1068

Book II.

Spiders, (namely, those that are sluggish, fat, and that ly in holes) make but a very course Web, and groffer thred by farre, which they hang only to holes in Walls. These have a more heavy body, shorter seet, and are more unfit to spin or card, they light upon their prey rather by chance than seek for it, because the hole is great without, and seems a sit place for Flies to hide themselves in; but at the very entrance they are ensured by the Spider, and catcht, and are carryed into the Shambles for Flies to be slain. For they ly deep in Walls, that they may escape the Birds that ly in wait for them (as Sparrows, Red-breasts, Nightingales, Hedge-sparrows) and that they may the sooner ensure the Flies that suspect no harm. And for Spiders that are harmlesse, and for their Webs, let this suffice: Now we shall adde some. thing concerning those kindes I have observed.

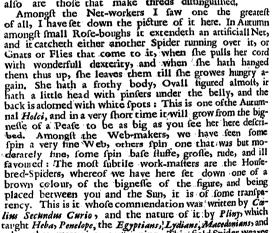

The Theater of Infects: or,

CHAP. XIV.

Of certain kindes of Spiders observed by Authors.

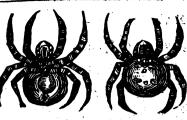

TOu may remember that I so divided Spiders, that some were venemous, and called Pha-Y langia, and others were harmlesle: Few of the Phalangia (and perhaps none) use to fpin, but all the rest spend their time in making threds or Nets. Some of these Net-work-

workers are House Spiders, others are field Spiders, so also are those that make threds distinguished,

others that were given to ipinning. This field spider weaves a moderate and firong Web in hedges, freech ing forth his sheet with a Coverlaid, and where he dwells he waits for his prey. His Web is thicker that it may not rain through, and better to endure the force of windes, the hath a brown body, but feet that are changeable colours, varyed with black and white spors in order, she hath a forked mouth, senced with clawes, the two white spots that are seen above in the head I know not whether they serve for eyes, the whole body is gently hairy; she doth firetch out her Web wide and long, that she may catch much prey, to which she is very much addicted. This field Spider spins a base and unpolished thred, and gathers it as it were into a

bundle. Pennius tirst observed this kinde in Colcheffer fields berween wilde Origanum watching for Flies, and he never faw it otherwise. It hath feet like to those described fint before,

round body like a Globe, the back is marked with white spots, also it hath a fundament four Iquare, and black. Hitherto also we referre three kindes of the Spiders called Lupi, who live in chinks of Walls, heaps of stones, and old rubbish: they weave a base and small Web in their holes, and in the day time they wander farther abroad in hopes of prey, which they fet upon with great force, and draw into their dens. The greatest of them is of a brown colour, in hath a head almost of Ovall figure, the body as a Globe, both sides are adorned with two

small and short white lines, about the middle of the back it is of a more whitish colour, it hath feet comely with divers black and brown fpots: The middlemost is the least, and grey-coloured; the ridge of the back is fet forth by three Pearles as it were, whereof that which is next to the neck is g eater and longer. The third feems to be blacker, wearing a Crosse overthwart the back very white, and with right angles, and therefore some call in the holy Spider. I conjecture that these are of the Wolf kinde, because they run with a kinde of leaping, and discover a great ravening appetite, for they lay up nought for the morrow, but consume all their provision in one day. Gesner saw one of this kinde that was Ash-coloured. There

are also Spiders with long shanks, that make disorderly and most rude work. The field Spider with a Body almost round and brown, that lives about graffe and Sheep, the English call it Shepheard, either because it is pleased with the company of Sheep. or because Shepherds think those fields that are ful I of them to be good wholfome Sheep-pasture, and no venome to be it, (for this Shepherd taken inwardly, or outwardly applyed, is a harmlesse Creature.) There are yet more kindes of Spiders, for there is a kinde of black Spider, with short feet, that hath a white Egge under the belly, white as fnow, and running swiftly; when the Egge breaks,

many young Spiders run forth, which go all with their Dam to feed, and at night they rest upon the Dams back. Pennius supposed that this was rough with warts, untill he touched it with a straw, and saw the young Spiders to run down. Also in rotten hollow trees there are very black Spiders, with great bodies, very short seet, that dwell with Cheeslips, and Catterpillers called Juli. Also saith Gesner, we have seen them all white, with a compacted and broad little body, upon the flower of Mountain Parsley, Roles, and grasse, they have most long slender legs, the mouth is noted with a spot, and both sides with a red line; he thought it was venemous, because he saw a Munkey almost dead that had eaten one, and

could hardly be recovered by powing Oyl down his throat. We know also Spiders with a long body, and a sharp tail, they are red from black, as also green. Also there are red ones of two kindes, one great one that dwells only in the Caves of the earth, with a body Cinnaber colour, with feet yellow from red, the tail and belly tend toward yellow a little from brown. There is another fort very small, lesse then a Sheeps Tike, as red as Scarlet, it hath but fix feet, being a monfter amongst Spiders; it hath a head like as Spiders have, but it is very small: It lives in the earth, and weaves a very course Web, and not well wrought; fometimes she wandreth abroad, and shews great agility to catch her prey. We grant willing ly that there are more kindes of Spiders, and of more colours, for our land brings not all things forth, nor yet did Attorides, though he was called autorius, see all things. It may be future times may delineate the rest better. In the mean time we have spoken of Spiders if not to delight, yet according as

we thought fit, and we would do no more, because in writing so much of them we have taken great pains: Yet this we shall observe, that all Net-workers, and Web-workers amongst Spiders, do grow to have greater skill by age, and that shut up in Wooll, they increase the generation of Moths, and they yearly oft times cast off their old skin, and the greater and

lustier they are, the more ingenious are they found to be in their gifts of life.

CHAP. XV.

T is manifest that Spiders are bred of some aereall seeds putrefied, from filth, and corrup-

tion, because that the newest houses the first day they are whited will have both Spiders

Of the generation, copulation, and use of Spiders.

Generation.

Copulation.

The use.

and Cobwebs in them. But their propagation is frequently by copulation, the defire and aft whereof lafts almost all the Spring. They do by a mutual and frequent attraction of their Net, as it were kindle venery, and continually as they draw, they come neerer, then at last they copulate backwards, because that manner of copulation, by reason of their round body was most convenient: After the same manner do all the Phalangia that weave, copulate together, and they are generated from creatures of the same kinde as Aristotle tellines. But they copulate not in the Spring, but ar beginning of the Winter; at which time they go faltell, and hurt certainly, and feem to be more venemous. Some after copulation lay one Egge alone, and carry it under their belly, and it is white as fnow, and they fit on it by course, the male sometimes helping the semale. Others lay many and very small Egges, like Poppy-seeds out of which sometimes thirty small Spiders are bred, after some trilling sports in their Web, they go forth with their Dam, and in the evening they come in again, untill such time as each of them hath learned to spin its own Web, to live more safely and pleasantly, they thrust forth their young by leaping, they sit on their Egges three dayes, and in a Lunar moneth, they bring their young to perfection. The House Spiders lay their Eques in a thin Web, but the field Spiders in a thick, because they may result the greater forces of in a thin Web, but the field Spiders in a thick, because they may resist the greater forces of winde and rain; the place helps much for Generation. For as in the Countrey of Arrhentia, and in the Island of Grete there are great force of Phalangia, foliate Iteland there are none; they did not long indure in England, the Tower at Gratiangias Would suffer, none, for though many of our Spiders swallowed down do hurt us, yet their bits in admitted, and no man is killed by it bur the bitings of all Phalangia are deadly. Where shall you not finde these Spiders that bits without doing hurt? they climbe up into Kings Courts to teachthicm verme: they work in Noble mens Chambers to teach them their Duries: they dwell in poor mens houses to teach them patience, to suffer, and to labour force but into your or chard, and each tree is inhabited by them, in your Garden, they hide in Roses, in the field they work in hedges, you shall finde them at home and abroad, that you may have no cause to complain hedges, you shall finde them at home and abroad, that you may have no cause to complain that there are no examples for vertue and diligence every where. The Spider, though Pallas called her impudent, Martial unconstant, Claudian bold, Politian pendulous, Juvenal dry, Propertius corrupt, Virgil light, Plantus unprofitable : yet is she good, and created for many uses, as shall appear clearly; wherefore adoring the Majesty of God who hath given so great vertues to so small a Creature, we shall proceed to speak of the profits we receive by her. The Flie-catching Spider wrapt in a linnen cloth, and hang'd on the left arm, is good to drive away a Quotidian, faith Tralianus. But better it many of them be boyld with Oyl of Bayes to the confidence of a Liniment; if you anoynt the arteries of the Writts, the arms and Temples before the fit, the Feaver abates, and foldome comes again. Kiramides. A Spider bruised with a plaister, and spread on a cloath and applyed to the Temples, cures a Tertian. Dissecutives. The Spider called Loyess, put in a quill, and hang'd on the breast doth the same. Pliny. That House Spider that spins a thick fine and white Web, shut up in a piece of leather, or a Nut-shell, and hang'd to the arm or neck, is thought to drive away the fits of a Quartane. Dioscorid. Pennius faith he proved it to be true. Three living Spiders put into Oyl, let them presently boyl on the fire, drop some of that Oyl warm into the ear that is in pain, and it profits much. Or presse out the juice of Spiders with juice of Roses, and put it in with Wooll. Marcellus Empir. Pliny bids infuse them in Vinegar or Oyl of Roses and stamp them, and then drop some into the ear with Sastron, and it will still the pain certainly : Dioscorides affurms as much. Sostratus mei Santon, saith, that Cranocolaptes (a certain Spider) drowned in Oyl, is a present remedy against poysons, as the Scholiast of Nicander professeth. Somecatch a Spider with their lest hand, and bruise her in Oyl of Roses, and drop some of it into the ear of the same side the tooth akes, and Pliny saith it is a cure. Laid upon their own bires, and taken inwardly they help us. What should I speak of the Albugo of the eye, a molt hurtfull ditease? Yet that is taken away very easily by the help of one Spider, if you do but bruite the longest and slenderest feet (especially of that kinds of Spiders that are the whitest) with Oyl, and anount the eyes affected with it. Pliny. Also the running of the eyes is stopped, (which the Greek call empored) with the dung and urine of a House Spider dropt in with Oyl of Roles, or one dram of Saffron, or else laid on alone with Wooll: whereby you may know that there is nothing so filthy in a Spider that is not good for something. Action for suffocation of the mother, applyed a Cerate of Spiders to the Navel, and faith it did great good. Pling faith, that Spiders help the swelling and pain of the spleen but he cells us not his reason. He faith moreover, that if any man takes. Spider coming down with his thread, and bruiled in the hollow of his hand, do lay it to the Navel it will earse a stool, but if he takes him climbing

CHAP. 15. up, and applies him, is stops ebe belly. He writes also that a Spider applyed to one that knowes not of it, and taken off the third day, will cure a Felon. The head and feet being taken away, it helps swellings of the Fundament. The same Author. By the sume of Spiders all the Lice fall down and never breed again. Goose-grease and Oyl of Roses with a Spider anounted on the breafts, keeps the milk from curding in them. Anonymus. Also that knotty Whip of God, and mock of all Physicians, the Gomt, which learned men say can be cured by no remedy, findes help and cure by a Spider layd on, if it be taken at that time when neither Sun nor Moon fine, and the hinder legs pulled off, and put into a Deers skin and bound to the pained foot, and he left on it for some time. Also for the most part we finde those people to be free from the Gowt of hands or feet, (which few Medicaments can doe) in whose houses the Spiders breed much, and doth beautifie them with her Tapestry and hangings. Oh the rare miracle of Nature! O the wonderfull vertue of a poor contemptible Creature! O most happy rich men, if they knew many of them how to make use of a thing ready to do them so much good! Antoninus Pius was wont to fay, that the quirks of Sophistry were like to Spiders Webs, that had a great deal of art and ingenuity in them, but very little profit. But how often hath the bloud run forth of the body most miserably by a fresh wound? yet it had been easie to have flopt it by laying on a Spiders Web, something thick, and binding it fast on, were we but more attentive to look to such remedies that God affords us in our houses. But we are greedy after forain remedies, fetcht from farre, as if they were better that we bring with great pains from the farthest Indies, or more healthfull because of their greater cost, But unlesse mad af fection did drive us, as if we were Gad-flung, through all the places of Sea or Land, to finde remedies to flop bloud, cure Ulcers, hinder corruption, drive away inflamation, knit wounds: One Spiders Web would do more good than Sercocolla, Sandaraca, Bole brought from Armenia, Terra Sigillata, Argilla Samia, Terra Lennia: For it bindes, cools, dries, glutinares, and will let no purrefaction continue long there; wherefore it suddenly stops all bleeding at the nose, (as also bleeding of the Emrods, and bloud in a Dylentery, Menstrual bloud, and all over great evacuations of bloud by the opening of the mouths of the veins) whether you give it alone with wine inwardly, and lay it on outwardly, or else mingle it with Bloud-stone, Crocus Martin, and other things of that kinde. Also the Spiders web is put into the Unguent against Tetters, and applyed to the swellings of the Fundament, it consumes them without pain. Marcel. Emp. Also Pliny faith it cures runnings of the Eyes, and layd on with Oyl it heals up wounds in the joynes. Some rather use the ashes of the webs with Polenta and wine. Our Chirurgians cure watts thus: They wrap a Spiders ordinary web into the fashion of a Ball, and laying it on the wart, they fet it on fire, and so let it burn to ashes; by this means the wart is rooted out by the roots, and will never grow again. Marcellus Empiricus was wont to use the webs of Spiders sound in the Cypress tree, in a remedy for the Gone, to ease the pains. For the Tooth-ache, Galen 5. 12.1. 110. Out of Archigenes, commends highly Spiders Egges, mingled with Spike Oyl, and put into the tooth: Also Kiranides gives Spiders Egges to drink against a Terrian; whence we conclude with Galen ad Pison. From the Spiders web we may understand enough, that Nature hath made nothing so vile, but ther it serveth for its necessary use; if so be Physicians would use more diligence, and would not disdaign to enter into the wood of such things as are easie to attain. Now I will proceed to other things, least if I stay too long in the History of the Spiders, I may indeed be said to weave the Spiders web; yet I will add this, that Munkeys, Apes, Stellions, Lizards, Wasps, Ichneumons, Swallows Sparrows, Muskins, Hedge-sparrows, feed on Spiders. And the Nightingale, that is the chief of linging Birds, is cured from some diseases by eating of Spiders. When Alexander reigned, it is reported that there was a very beautifull Strumpet in Alexandria, that fed alwayes from her childehood on Spiders, and for that reason the King was admonished that he should be very carefull not to embrace her, least he should be poysoned by venome that might evaporate from her by sweat. Albertus also makes mention of a certain Noble Mayd of Collen, that was fed with Spiders from her childehood. And we in England have a great Lady yet living, who (as we faid before) will not leave off eating of them. I cannot but repeat a history that I formerly heard from our dear friend worthy to be believed, Bruerus. A luftfull Nephew of his, having spent his estate in rioting and Brothel-houses, being ready to undertake any thing for money, to the hazard of his life; when he heard of a rich Matron of London, that was troubled with a Timpany, and was forsaken of all Physicians as past cure, he counterfeited hiuself to be a Physician in practice, giving forth that he would cure her and all diseases. But as the custome is, he must have half in hand, and the other half under her hand, to be payed when she was cured. Then he gave her a Spider to drink, as supposing her past cure, promising to make her well in three dayes, and fo in a Coach with four Horses he presently hasts out of Town, lest there being a rumor of the death of her (which he supposed to be very neer) he should be apprehended for killing her. But the woman shortly after by the force of the venome was curedy and the ignorant Physician who was the Author of so great a work, was not known. After some moneths this good man returns, not knowing what had happened, and secretly enquiring concerning the state of that woman, he heard she was recovered. Then he began to boost openly, and to ask her how the had observed her diet, and he excused his long absence, by reason of the sicknesse of a principal friend, and that he was certain that no harm could pro-Тууу 3

Of leffer living Greatures.

1074

ceed from so healthful physick; also he asked considently for the rest of his reward, and to be given him freely. Truly in this present corruption of stanners and times, how highly is such a Mountebank esteemed, wherein chance is accounted for skill, and one accidental rash cure of a disease, with danger oft-times of the patients life, makes a Quacksalver a great Physician, and he is judged worthy of praise and honour? But a better revenging Judge will correct these things; we pass on to Pismires.

CHAP. XVI.

The commendation of Pismires; wherein we shall describe their Differences, Nature, Ingenuity and Use.

TO begin with the commendations of the Pifmires, I know not whether I shall first speak of their body or minde, fince Ants for both are not only to be preferred before many Insees, but also before many Men; for they are not one ey'd, nor horrid skew-ey'd, nor do they walk with crammed guts, as Ballio doth in Plantus, nor yet are they mishapen, crook-leg'd any way, gorbellied, over close kneed, blub-cheek'd, great mouthed, lean chopt, rude foreheads, or barron, as many great Ladies, and noble Women are, who have loft the faculty of generation; but the beauty of their body followes the goodness of their minde, and nature hath given them for their degree and order, a constant and absolute perfection. Cardan was the first faid they were blinde, because their body is small; not remembring that there are many Flies and Gnats that are far less than Ants, yet they have eyes and can see well. If they were blind, I see not what the light could profit them, and they would work as well in the night as in the day. I confess that their foreyards serve them for a staff to prove the way, not that they do not see what way they go, but because by those means they try the hardness and softness of things. They have a very little head, but round as the heavens are, wilde brain'd, set with eyes, a mouth with teeth, and a throat not without a tongue and a palate; they have a square breast with ribs to defend it, with lungs, or bellows that supply their room, that are so firm, and yet loose, that they never grow out of winde by labouring, but alwayes draw their breath most freely. They have a stomach in their belly that is strong to digest venome, (for they feed often on Serpents and Toads) and they are very hot in the matrix, and very fruitfull, to their commendation. What should I here mention their swift walking, and their equal motion when they goe? for they not only out-goe pack-horses for the proportion of their bodies, but out-run the swiftest Chariots. They vary in colour, according to the difference of their kindes and places. For there are red ones in Mauritania, and the Inhabitants of Budemelum have white ones. In Europe they are most an end black ones, yellow, and somewhat red from tawny. Here they seem very short, smaller, fine necked, slender, and weak bodied; yet these will carry a weight thrice as great and heavy as themselves; and those in India of a great bignesse, will carry great pieces of Hesh with them, and devour it.

Their praise from their minde, Their bodies you have feens now fee their mindes It's a sparing and laborious kindes And holds and keeps whatever she can finde.

Virg. 4. Encid.

Truly, as often as I remember the profuseness of Caim Julius Cafar, the luxury of Caligula, the prodigality of Nero, the excessive gluttony of Apicius, and the great waste of Heliogaba-lus; so often do I exceedingly commend the wit and ingenuity of the Pumire, and prefer her prodence before that of Men. I know that they lived sweetly, and with fat patrimonies from their fathers, they gained large inheritances; yet they found out new use of baths, dangerous kindes of meats, curiosity in banquets, ships made of cedars adorned with Jewels, the drinking of pearls, and they wasted as much in one year, as they could extort for tribures and customes, or by plunder both at home and abroad all their life time. Licinius Crassus had formerly much riches, who being brought to need, was laught at by all that met him, and the people in a jeer, called him the riches had Craffin. And (Oh God!) faith the Comedian, what a miserable thing it is for a man to have had a great estate formerly, and to have nothing now? how much better were it for us to imitate the Ant, who gathering corn in Autumn, doth not waste it prodigally in Winter rioting, but keeps it providently for future use, and daily store? Hence it is that she is never tortured with hard poverty, nor is she tossed on the billowes of cross fortune, nor is she endebted or in danger by borrowing from others; nor doth she seek from other creatures either work, or sustenance to maintain her, and keep her in health: and if frugality comes from fruits, as the Etymologist derives it, (for our Ancestors, the Masters of old sobriety, scarce knew any other diet) it is very credible that that vertue is passed from our first parents into the Plimires, who feed only on dry com to maintain their lives, and avoid all superfluity of many dishes. Hence the Poet elegantly feigned that the Myrmiden, the most excellent people of the Greek Nation (if you consider their

temperance, their labour and their diligence) were descended of the Pismires. For whence could they have gotten so great abundance of riches and goods, unless by an Emmets prudence they had preferred what they had gotten and laid up to prevent poverty? And as sparing in keeping, so diligence in getting, and wisdome and industry is found to be admirable in them. They take a very commendable way first to preserve their life, then for their posterity and lastly to provide their victuals. Fifth of all, they build themselves an house, as in the golden age, not covered with tyles for delight, but with green turfs, and not made of bricks, but fenced with mudwals. Histories do mightily magnifie the Pyramides, and trenches of Egypt, and the Labyrinth of Crete. But no man can sufficiently set forth the excellent work of trenches that the Ants make, the figure, the magnificence, the turnings, windings, and revolutions thereof: for these by an unifoga kable prudence, beyond all mans art, make houses under ground with such strange turnings, that they open only the way that is unaccessible to others, and is not possible for any that would do them wrong to enter at. First they make the earth hollow with their tender nails in the place of spades; and to throw the earth forth, they use their hinder feet for shovels: hereby they cast up a mount, and sence it about as with wals or forts; then they cover their work with chaffe, straw, leaves, bowes, bark, and pieces of sticks, and laying onnew matter, they raise a tower that may be seen afar off, (called an Ant-hill) which is far higher and more sloping than the foundation, partly that their houses may not fall by rain staying about them, and partly that they may live the more healthfully by reason of the air that penetrates and passeth through. This divine little creature fetcheth the fashion of its building from heaven, either because their multitudes required foom, or their excellence required the best. The entrance is not right forth but turning with many labyrinths and muses; they distinguish their chambers in this tower of theirs in a threefold order, yet it is so hard to come into them, that Argus who was all eyes, may be often deceived in them. The first room is large enough, like the Presence-chamber, where they all meet, and convene, we call it the universal Congregation house of Ants: under this for the females, there is the feminine room arched by Dadalean Art, wherein the eggs are laidfafe that they may produce their young ones, it is made left they should be thought careless of posterity. The third chambet is shoft inward, and most safe from showres, and that is built for their store-house for their com, that as it were in a granary they may lay up their belly-timber, and may fence it well from the winter cold that searcheth into all things; the adjacent parts and ourmost skirts of their castle they appoint for a place of burial, and there they bury their dead with honour and state. And this is the manner of their building, plain indeed, and within the ground, as were the houses of the wife men of elder times, before that pride, and the head-firong ambition of Minns invented to build up towers to heaven. Since his death, shall I speak of Kings or Princes? Truly there are some Citizens of the lower bench, who with extraordinary charge do build up, not an Ant-hill, but Mansoleum, or a prison for their bodyes, and adorn it with all the cost and art they can; worthy they are indeed to be devoured by Pismires whilest they live, that dying by the force of a wife Creature, they may suffer for their folly. Nor do Ants build houses that are places for idle people, or such as are mischievous to harbour themselves in, but every one, yet without any Commander, followes fome honest labour, and for the good of their democraticals states each one mutually employs his pains by turn. For they all, like those that labour in the Mines, do stoutly exercise themfelves in digging of trenches, some serve to repair their houses, to adorn them, and to keep them clean, others with great affemblies and funerall folemnities bury their dead, in the place of buriall adjacent, others again vifit the fick, and out of their Granary they fetch some Phyficall grain, (for they have Corn and grain almost of all plants) and prepare that and carry it to them. They have Officers of all forts, as Purveyours for Corn, Gleaners, Storers, Yeomen of the Larder, Housholders, Carpenters, Masons, Arch-workers, Pioners; for such is the vertue and skill of every one, that each Ant knowes what is needfull to be done, and willingly doth his best to help the Common-wealth. But in their ordinary work what labour and diligence do they use? If they be minded to build an Ant-hill presently, or else are forced on a sudden to raise a new house, the old one being undermin'd and decayed by the Moles digging under them, they go forth all in troops, and from the rubbish of their houses thrown down they build new ones hard by. First they gather together their scattered Egges, and Com, and put each of them in their proper places, afterwards they repair their hill, and covering and thatching that well, they keep all fafe and dry: when the Sun shines, when they go forth to ferch Com, the greater and elder go before them as Captains, the rest follow atter. They creeping up to the top of the stalk, bite off the ears of Com, and the young ones stay and gather them up, and the Chasse being fallen off, they pull the Corn out of the husks, and then they carry it home; and the end of it being eaten off, if there be necessity, they set it at their doors a funning, and when it is ventilated they lay it up again. When gleaning is done, they frequent the threshing floors, and there not by stealth, but openly they take suffenance for their lives, and they enrich their treasury. Which labour of theirs Virgil wittily describes in these Verses.

As when the Ants plunder a heap of Wheats Minding cold Winter, store it up for meatTheir black Regiments through narrow wayes passe, And carry their prey over fields of grasse, Some bear the burden, some them forward drive, Chastning delayes, who shall work most they strive.

Wherefore not unfitly did the Prince of morall wisdome, send those sluggish and slothfull Monflers of Mankinde (who like Mice live alwayes on other mens labours, and goe from doze to dore like Vagabonds to beg a peny) to learn wisdome of the Ant, that by the example of the Ant, they may use opportunity, and lay afide begging, esteeming labour much, which is the Merchant for all that is good. Hitherto belongs that of the French Poet.

> Poor Sluggard who dost live in penury and want, Behold the houshold prudence and wisdome oth' Ant, Lest she should stand in need, which she doth greatly fear. She gathers in one moneth, to serve her a whole year.

This is their diligence in gathering, their care in preserving, their prudence in storing, their economicall skill in distributing what they have said up. I shall shew you also their modesty on the way, which me thinks should not be over-passed. For though they go in a narrow Way, yet are there no brawlings, contentions or strivings for it, nor yet any murmurings, or fightings, or flaughters amongst them for place, (as it is usual amongst proud men.) But the younger gives place to the elder, and he that carries no burden, to him that is loaded, and each of them is ready modestly rather to passe by an injury, then Waspishly to offer one. If any man compare their burdens with their bodyes, he will confesse that no Creature hath more ftrength, confidering their proportion. They carry their burdens in their mouths; the greater burdens they attempt to take up backwards with their hinder feet, and lay their shoulders to them with all their might. They have all a care and mindefulnesse and endeavour for the publick good. They store up the seed they first bire, lest they should grow again in the earth; when they are subject to grow mouldy, and are wet with rain, they bring them out and dry them in the Sun, wipe and torrefie them, and then they lay them up in their Granaries again. The greater feeds they divide at the entring. They work also at the full Moon in the night, (as good Mowers are wont to do) and when the Moon is in conjunction and hid, then they forbear labouring. But what pains do they take in labouring? How dilgent are they? And because they work in divers places, to come home with it, the one not knowing what the other doth. Certain dayes (faith Pliny) are appointed for a generall survey, and meeting to enquire into the businesse, what running together of them is there then ? how civill is their conversation? how complementally do they falute one the other? how diligently do they feem as it were totalk together, and to make enquiry? You shall see see Flints worn in the path they goe, and a path made in Marble stones, that no man may doubt but that diligence will doe fomething in any matter; for they all goe almost in the same path. For if one carry a burthen too heavy for him, the rest in the way will come and help him, lending their legs and shoulders, if it be a light burthen the fewer come to affift, if a weighty, more come, and either draw back, or thrust forward, or if the burthen be too great, by biting it in funder, and dividing it, they promote their businesse: And by this means they bring home a great heap of straw and flicks to their houses. Now if any will attempt to hinder the Ants in their labour, (as the Serpents and Toads often doe when they meet them,)

> -They fight and will not flies And hold it noble in these wars to die.

For then (making as it were an agreement) they confpire together, and with horrid and cruell bitings, they destroy the enemy. He that hath not fastened upon the common enemy, thinks he hath deserved little of the Common-wealth, and upon that score they fight. In the time of harvest, when such an accident falls out, they do not meddle with a dead body, but presently as the enemy is vanquished, they fall to their labour again, and they gather up again the Corn they laid aside before the battell, and lay them up; for they hold it no prudence to stay to plunder, when greater businesse doth require their industry, and they hold it ignoble to contest with those that are dead. They feed chiefly on grains of Wheat, Winter Corn, Barley, and hard meat which they delight in. They take great pleasure in Cyprus Nuts, and the tender flowers of herbs that are red. They ear Scorpions (called Geraret) saith Rhasis, and they feed on the Carkases of Sorpents and Frogs when they are hungry. Otherwise they abhorre to eat corrupt and venomous things; nor will they touch fruit polluted with Mentituall bloud, nor taste of them. Have not men by reason of hunger been compelled to feed on Horses, Wolves, Serpents, graffe, and dead bodies in time of narrow sieges? That is sufficient to prove their cleanlinesse, that they carry out their dead in the husks or bladders of trees and Corn, as of old time the Romans buried their dead in pots, but they now carry them forth on Biers, They delight to live in clean houses, and for that purpose they do not lay their dung, (that is

CHAP. 16. like to Urine) within doors; and when they travell through dirt, and are bedawbed, at the entrance of their houses, they rub themselves clean against some rough bark. They love and take fuch care for their young ones, that they alwayes carry their Egges in their bosomes, so long as they are fittle, and not so overgrown that they hinder their labour; but then they lay them up in their deep hostow Cave, that they frustrate the birds that prey upon them, as the Wood-pecker, the Nightingale, and also the Bear. But so soon as the young Pilmires come forth of the Egges, they immediately they them the way to labour and take pains, and if they refuse to work they will give them no meat. Hence you may observe that they set every one his task: The ftronger With their mouths, feet, little nofes, do cast up the earth, and when they have cast it forth, they make it up in heips, when they heap it up, they mingle fraw with it, that it may lie light, and lie hollow. The wifer fort of them do build, the leffer of them remain in their trenches, and work, the more expert make windings like Maandres and Labyrinths, and frame vaulted Chambers, If they observe any to be idle, they not only drive them out, pinched with famine as a base breed, but they bing him before the door, and calling a Councell of them all, they put them to death, that their young ones may take example, that they may not hereafter addied their mindes to floth and idlenesse. The dayes appointed for labour and gathering Corn, they fet venereous action afide; and chiefly in Winter, (when there is neither fowing nor mowing) they couple together: yet for modely fake they use venereous actions within doors, as the Bees do, at this time they make much of their Females, and when they are great with Egges they embrace and love them most. Above all they take care (O wonderfull love to their young ones) that nothing may be wanting to their off-fpring for food or instruction. He only can doubt of the valour of Pifmires who never faw them fight, nor heard the report of their battels. For they are not only full of choler, (as the proverb is) but they have a purpose to fight, so that they either joyn battell with external enemies, or else hold civil warres amongst themselves, when they want food. For though Pismires never fight when their Granary is full, and their Democraticall Government stands fast whilst they have plenty of food; yet (what we read to have hapned in the best ordered Monarchies) in a death, or rather want of provision, they fight desperately for food, and for their lives, and the lesser of them will rebell against the greater, (as being the greater gulphs of the Common-wealth.) It is the nature of necessity to give and not to take Lawes, and then chiefly when the belly a troublesome Client, doth feed on it self, and the guts croke and are empty. There are few justers than Lysimachus was said to be, nor were there better subjects then the Athenians, yet both of them did many things disorderly in samin, and he gained thereby to be branded with the name of a pusillaminous, faint-hearted Prince, and they of tabulitons schiefly. Therefore this warra of the Dispires is to be commended. and they of rebellious Subjects. Therefore this warre of the Pifmires is to be commended, that is not undertaken for a Crown of Ivy, Bayes, or of Gold, or of Graffe, (which was accounted the most ancient) but from intestine necessity, and nature leads them to it; for neither could Solon himself endure thirst, nor Solomon conquer hunger. For these will dig under all walls, will be held by no bands, and they only know neither Lawes nor bounds. And Silvius relates a strange history of this fight, lib. de Europa, c. 50. His words are these. In the County of Bononia, many sircle Pismires that were hungry, clambered up a dry Pear tree to feek for food, the greater Pilmires came upon them in no small number, and these took the meat out of their mouths, and killed some of them, others they threw down, those that were call down returned to their Ant hill, or fort, in the way they meet with others, and seemed to talk with them, and rip up the injury they had received, and they bring forth all the forces they had, and their companions out of their tents. About two hours almost afterwards, so many bands of the lefter Pifmires, and such a mighty Army drew forth, that the whole field appeared black by these black souldiers; they came all well guarded, and compassing the stock of the tree round, they began to climbe up. The greater Pismires when they saw their enemies at hand, drew close into a body to receive the encounter alort; so soon as the Armies mer and fought, the great ones killed abundance of the lefter ones with fierce biting them, and they deltroyed all those in a terrible skirmish that first ventred up, that at the root of the Pear-tree there lay a great heap of them flayn. The rest of the little Pinnires and the middle Army would not be daunted by this, or run away, but they recollect their forces, and attempt to be revenged, and following more stifly, and pressing one Army after another, they mounted up the tree in greater numbers than before, and they bite their enemies on the back, on the fides and in the front, and they forced them to yeeld, and leave the tree. The greater Pifmires were much too ftrong for them, but the numerous multitudes of the little ones prevailed against them, and twenty at least fet upon one. This happened when Eugenius the fourth was Pope, Nicolain Pifforienses a most learned Lawyer standing to behold it, and he related the manner of the fight fincerely and truly. Olam Magnus reports the like accident to have happed at Opfas and Holmen, before that parbarous and cruel Tyrant Christianus the second was driven forth by the Inhabitants of Sweden, from ruling over the Goths and Sweden In which barrel that must not be forgotten, the leffer Pilmires after they had won the field intered the bodies of their fellowes, leaving their enemies expored to the Crowes and Mufkins; also they made choice of a high Tower for the place of combat, as if they would with a clear voice call and draw unto them the prodigy of Tyrants and his followers, to fee their

destiny revealed, and the punishment that hang over their heads. Also they hurt Elephants and Bears, but not unlesse they be first hurt by them. They afflict Serpents and Dragons and make them mad. but it is either because they hinder them in their labour and stop the way, or because they breath their but it is either because they hinder them their venemous breath into their caves and turrets. Grashoppers and Dormice they hate exceedingly, those because they spend the Summer time in singing, these because they lose the Winter in sleeping, for a Common wealth well regulated doth punish idle persons as well as those that are wicked, and the Spartans were wont to cast forth those that would not labour. They live very long, and would hardly ever die, unless the Birds did catch them before their time, or the flouds and waters drowned them. They are for the most part very healthful, because they observe those three rules of Plato very exactly, mirth in labour, temperance in diet, and sparing in venereous actions. For what creature labours more chearfully, diets more moderately, or did nature ever produce that is more temperate in venery? Also there is in them many seeds of domestick discipline, justice, friendship and other virtues; and had we the like, either by nature or by art in us, we would fcorn to live basely on the labours of others, and we would resuse to be slaves to our bellies. Moreover they have some sense of future things; for before a samine they labour exccedingly, continuing their work night and day, and every where laying up a great store, as Juvenal hath it Salyr 6.

> -Hunger and cold away drive, And from the Ant learn thou an art to thrive.

Since therefore (to wind up all in a few words) they are so exemplary for their great piety, prudence, justice, valour, temperance, modesty, charity, friendship, frugality, perseverance, industry, and art; it is no wonder that Plato in Phedone, hath determined, that they who without the help of Philosophy have lead a civill life by custom or from their own diligence, they had their souls from Ants, and when they die they are turned to Ants again. To this may be added, as I related before, the fable of the Myrmidons, who being a people of Ægina, applied themselves to diligent labour in tilling the ground, continual digging, hard toiling, and conftant sparing joyned with virtue, and they grew thereby fo rich, that they passed the common condition and ingenuity of men, and Theognie knew not how to compare them better then to Pilmires, that they were originally descended from them, or were transformed into them, and as Strabo reports they were therefore called Myrmidons. The Greeks relate the history otherwise then other men do; namely, that Jupiter was changed into a Pilmire, and so deflowred Eurymedusa the mother of the Graces, as if he could no otherwise deceive the best woman, then in the shape of the best creature. Hence ever after he was called Pismire Jupiter; or, Jupiter King of Pismires. For the generation of Pismires are endowed with so much virtue and justice, that they need no King to govern them, for each of them can regulate his own passions; or if they have any King, it is the Supreme Jupiter, that governs all, who is deservedly thought to be the Fountain and Authour of all virtue both in Men and P.fmires, and all other creatures. For there is none amongst men that doth govern better then the Pilmire; and we that should teach them (as faith St. Hieronymus) may learn of them divers things that are necessary for our souls and bodies. For when contrary to their nature and industry they hide themselves, we are certain that rain is not far off; and when we see them running here and there, and carrying their egges before them, we are warned thereby of great winds and tempels. Also those that are well acquainted with Country learning, when they see the Pismires run here and there, extreme fast, twice as much almost as at other times, and take such huge pains in gathering and storing up Corn, they are warned of a famine at hand, and so buy up all the Corn they are able. For they more rightly and certainly by their naturall magick foreshew Tempests, then our Soothfaying Almanack-makers, that are derided and exploded for vain fellowes by all godly and truly learned men. For let Ennise be heard;

> They that are out shew other men the way, And promise riches who have none to pay. To whom they promised to them they pray.

Nor doth Accius leffe elegantly describe them, who was the chief in writing of Tragedies, in his Atticis we read thus;

> I trust no Wijards, who have learn'd the skill, With gold their houses, others ears to fill.

They do better in my opinion who observe the Pismire, and grow rich by following his manners in labor, industry, rest and study. We read of Midas that he was the richest King of all the West, and when he was a boy, the Pilmires carryed grains of Wheat into his mouth whilst he slept, and so foreshewed without doubt that he should be endowed with the Pismires prudence, and should by his labour and frugality gain so much riches, that he should be called the Golden boy of fortune, and the darling of prosperity. Ælianus. And when the Auts did devour and eat up the live Serpent of Tiberim Cafar, which he fo dearly loved, did they not thereby give him fufficient warning that

he should take heed to himself for fear of the multitude, by whom he was afterwards cruelly murthered? Suetonim. They do teach us by their example of labour and virtue, both because they do inculcate unto us parfimony and perfeverance, and also because when they are grown rich they maintain perpetual and inviolable friendship. For though at such a time one man is a wolf to another, and the defire of having more increaseth with gain, (which the Greeks call whorestie, 'Coveoufnefs) yet as the Comedian fpeaks :

> In good or bad what ere it be. The Ant with Ant doth ftill agree.

And they never fight and jar but upon occasion of extreme famine. Horace chargeth them with Covetousnels, because they alwayes heap up more; but since they do that for the common welfare, that reproachlof his is not their fault. But they eat Serpents, and live fometimes on venomous things: I grant that, and may be they use it for their Theriac, and are not therefore Pismires to be commended? Yes as well as the Storks, they ought to be fed from the common Treasure, and I might say to be adored as well as the Indian Rat Ichneumon. In Ishmus the Priests sacrificed Pistines to the Sun, either because they thought the Sun the most beautiful, and therefore they would offer unto him the most beautiful creature, or the most wife, as feeing all things, and therefore they offered unto him the wifest creature. But you will say, they are most hurtful creatures to Vines, to Dittany, to young shoots, and to many tender plants, and Pliny cals them the plaque of srees. But Gellius cals them more properly the revengers and judges of idle people; for they by their labour call us out of our lurking holes, and drinking houles, to till our grounds, and take care of our Orchards more diligently, and to exercise our wits, and to be more industrious in our business, and to do what is just and equall. Go forth then idle companions and powre on a little hot water wherein lime hath been infused, and believe me not, but you shall drive all Pilmires away, and shall infuse more life and spirit into all thy plants. Origanum, brimstone, Assa, Nitre, Snails-shels, Lupines, Lazerwort, wilde Cucumbers, Buls gall, boyl, and cast on, or but in sume or sprinkled: also many things there are ready to be had for one that is diligent and laborious, whereby you may quickly drive out this plague from your grounds, and you may expect a great retribution for your pains, abundance of fruit. Moreover all those things that drive away Wasps and Horners, that we spake of before, will afford you a sufficient remedy, and will also kill all the Pismires. Yet in truth, thou sluggard, thou hast more need to nourish up this creature and set up for it a statue of gold. For so of old time they are said to have done, when they worshipped the Ant, in an hieroglyphick, holding three ears of corn in the mouth of it, as being an emblem of divine providence, and labour, and of household care. For they are, to use Ariffolles words, without any King, and under a popular government; yet every one of them is for himself a father of his Countrey, and they do to their power increase the common good as if it were for themselves in particular. But if you object, that the Pismires by biting cause redness, tumour, tickling, and then a grievous pain where they bite; I do not wonder at that; I rather wonder at this, how thou canst look upon them, and not blush extremely, for thou canst not chuse but blush to see such great industry in so small a creature, and to behold the watchfulness, labours, journeys, sweat, and toil that he is bussed in. Year they do not wound idle people so much (whom alone they are said to sting) but it will be cured with an Emplaister of Varignana, made of Flies and Pismires mingled together; for as Scorpions, fo are they the remedy for the wounds they make; and they bring their cure along with them when they bitc. Pliny, Columella, Arnoldus, Ellanus, Albertus, and Vitalis, will direct you in other helps, but you must not draw them out and apply them, without uling the prudence of the Pilmire. Will you give me leave to reckon up the infinite benefits you may receive from them, for this small detriment you accuse them for? Now listen what the Ancients write concerning the virtues of them, and judge uprightly concerning it. For they are not only meat for Serpents, Dragons, Beares, Locusts, Rats, Dormice, Chameleons, Lapwings, Woodpeckers, Larks, Nightingales, Pheasants, Wagtails, Hens, sometimes to fatisfie their hunger, some times as remedies to cure them of furfets, as Pliny, Solinus, Plutarch, Palladius, Euftathius, Bellonius, Albertus, and experience do witnes: But also the Inhabitants of the Countrey of Mangi, do feed on red Pismires seasoned with Pepper, and they are their greatest dainties as Nicolam Venetus doth testifie. Also they are good to catch Locusts, and to bait for many fishes, chiefly the Roch. As concerning Phylick, there are but a few dileases that these creatures, as the hand of God, do not Their Physiyeeld some help unto. Doth a Feaver burn and scorch thee alive as it were in the Engine of call use. Perillus? hearken and I shall tell thee of an admirable water to quench that fire, and most effectual against it, as Gesnerveceived it from a friend: Take fountain water one pound, honey three spoonfuls, shake them in a can, and set them in an Emmets hill, so that Pismires may easily fall into it; when you find that so many are fallen in as will thicken the water, shake the Can, and as you useto do in making Rose-water, so distill them. The dose is half a spoonfull, or more as the Patient can endure it by reason of his force more or lesse, it will wonderfully provoke vomiting, and will ello evacuate the matter of the difease by Urine. Pliny is the Authour from the old sayes, that a Quotidien, Tertian, Quartan, and all intermitting Fevers will be cured, if the fick cause the parings of his nails to be cast before the entring of the Ant hill, and if he catch the first of them that layer hold of them, and bind him up and tie him about his neck. Art thou troubled with pains in thy ears? go to, fill a glaffe with Bmmete and Emmete egge, and stop it well, and bake it in an Oven

1080

with the bread, till it be as hot as the bread that begins to heat; then shall you find a water that is very usefull to cure the pains in the ears if it be dayly dropped in. Is there a cloud before the fight of presse out the juyce of the red Emmets, and drop it in, it doth corrode with some pain, and wholly extirpate it. Erosum, Trosula, Thiophrassum. Emmets egges beaten and put into the ears, remove all deasness quickly. Marcellus. Some bruise them and press out the watry substance, and drop it in. Some insule them in a glasse vessell in Oyl, and boyl that on the fire, and power that into

If Urine be retained and cause the Dropsie, drink twenty Pilmires, and so many egges with them in white wine, and they shall help you. Also their egges distilled do much when Urine is stopped Lee Fdventinus. A Maid that cares for her beauty, and would make the circles of her eye-lids black, Emmets egges bruifed with Flies will perform that, and give them their defire. Some again either through age or disease (to use the Poets phrase) are beaten in their property, and have lost their generative power, that they cannot do the office of a husband if they would. Some Authours commend to these oyl of Sefamum with Eminets egges bruifed and fet in the fun, if the yard and tefficles were anointed with it. To this oyl fome add Euphorbium one scruple, Pepper, Rew seed, of each one dram, Mustardseed half a dram, and again they fet it in the fun. Rafis. Arnoldus in this case commends black Ants macerared with oyl of Elder Nicolans mingleth it with roots of Satyrium; and others do give the diffilled water thereof to those that are fasting. Gesner in Euonymu describes a water conducing thereunto; Take faith he, a pot besmeered within side with honey, and half full of Ants, then add long Pepper, Nurmegs, Cardamon, Pellitory of Spain, each one pugil, Butter what may suffice, and digest them fourteen dayes in horse dung, then distill them in a Bath, and give a little duly to be drank fasting. Others, faith Merula, add Comfery to oyl of Pilmires; others Boran, or root of Masterwort with Wine when the impotent man goes to bed, and thus they affirm that men may be cured of feeblenesse, and women of barrenness. But I wonder at the force of Pismires in this case, for Brunfelsium writes that but four Ants taken in drink will make a man unfit for venery, and abate all his courage thereunto: yet he will maintain that Emmets with common falt and egges, and old hogs greafe. wrapt in a cloth and laid on, will cure the pain of the Hip-gowt. Marcellus faith, that if they be applied with a little falt, they are a present remedy for a Tetter : Also as Serenus relates, they are good against scabs and itch from an inflamation of bloud :

> The dust in Emmets hils doth deep ly, Being mingled with oyl, will help it by and by.

Also Arnoldin reckons Emmets egges amongst such things as take off hair; and commends water distilled from them against Nolime, tangere, and all corroding Ulcers. Albertin thinks that drank with Wine, they do powerfully dissipate winde. Reckon how many. Warts you have, and take so many Ants, and bind them up in a thin cloth with a Snail, and bring all to ashes and mingle it with Vinegar. Take off the head of a small Ant, and bruise the body between your singers, and anoint with it any impostumated tumour, and it will presently sink down. Nonus. Also God, that I may omit nothing, by the biting of Ants called Solipuge (it is a kind of venomenous Ant) drove the Cynamolgi (a slothful and idle people of Ants called Solipuge, but Cicero cals them Solipuges. I have a few things to speak from Authors, as from Anibologius, Apibonius, Natalis Comes surpensous and the progression of speak from Authors, as from Anibologius, Apibonius, Natalis Comes surpensous and Moichea a witty Book of the same argument. And Aratus, Herodotus, Strabo, Arishophanes, Rasis, Aggregator, Beroldus, Ryssius, Zetzes, Arnobius, have by the by run over the natures of them, and their polite life. But because they add but little to what hath been said, I would no longer play the Pismire, lest seeming to be eloquent I might grow impertinent, and searching every creek too narrowly, I should make more gaps. God grant that we whom God hath commanded to learn of Ants, when we are idle and mind nothing but our bellies, may by his good guiding learn of them, and he instructing us, we may perform our duty. It is a small creature, and contemptible for its magnitude, yet we must know that goodness is not in greatness, but what is good is to be accounted great. I have said.

CHAP. XVII.

Of the Gloworm, and the female Melo, and of Anthremus and the field Chiflep.

Fc-times those that are of a great saction, and of noble descent, will scorn to marry with one of a common samily. Yet the Poets write that Inpiter did not dissain to imbrace ordinary women; and the Cicindela or Gloworm, and the oyl Beetle or Melos, (though they are of the winged order) are not assumed to couple with others that want wings. And for as much as these semales are endowed with the same force and dignity by nature, which is seen in males, I know not why they should refuse or be weary of their chance, and of their semales, when as (if their wings be taken off) they agree in the same endowments of their minds and bodies. We spake abundantly in the first Book, concerning their form, figure, manners,

virtues, use, when we speak of their males that have wings; and though this Treaty is allotted for Insects without wings, yet I would not artificially separate the semales from their males, whereas naturall love hath from the beginning united them together.

I give you here the picture of suibrenus, which the Greeks call Anthrenus without wings. Some con-

jecture thatit is a creeping Hornet; others think it is a kind of the Spider Phatangium, which Pliny faith differs from a Hornet only in want of wings. It hath a crooked nofe, and forked, and the face looks upward. It perfectly represents that horned Owl that we faw in the low Countries. It hath black eyes, a breaft very hairy and yellow, the feet are yellow at first, then brown; the rest of the body hath 8 junctures that are yellow from red, which is much adorned by black spots on the back; from the top of the nose, failvards or horns of a yellow colour grow forth; they are all hairy and flexible yet are they fomething hard in feeling. He bites to that it is hard to cure it, vetit feems not to be fo deadly as the biting of the Phalangium, nor is it yet so gentle but that the venom of it exceeds the Hornets. If hereafter I can discover any thing more concerning the nature of this little creature, the conditions and use of it, I shall willingly doit for the publick good; for far be it from me to conceal any thing that may make for the advancement of Learning.

CHAP. 18.

From the similitude this Infect hath with a Chiff p, we call it the field Chiff p; for it is found in Corn fields; it differs from the rest only in the number of its feet,

(for it hath but fix feet that are very small and black) The neck of it is very short, the body something broad and compact, the tail somewhat painted. Pennius saw one in July about Colchester, or else he never saw it. What Physicall use it hath it is yet unknown to us.

CHAP. XVIII.

Of Mineral Worms with fix feet.

TN Pennius his papers concerning the nature of Wormes, I did for a time wonder at his opinion, I when he spake of Wormes in stones, and he averred that he saw little ones with fix feet in old rotten stones. For I had received from all Philosophers, that all things that are very bitter, salt, sower, sharp only, hot, cold, solid, hard, though they may corrupt in time, yet they will breed no worms, and therefore Theophrassus at them 2600, not that they want life, but because they breed no living creatures. I began to weigh the matter narrowly, and to put into an equall ballance, without fraud, all their opinions; at last I found that our Ancesters were here and there most foully deceived, and I ascribe more to mine and Pennius his eyes, then to all their words. Tell me in good earnest, is there any thing more bitter then Gall or Agarick, salter then the Sea, more tart then Leaven, more sowre then Vinegar, more hot then fire, or more pure and cold then Snow congealed? yet certain it is, that Worms breed out of all these: and it shall appear sufficiently by the sequell of the story, that Worms are bred out of stones, neither drinesse, nor folidity, nor coldness nor want of heat or moisture can hinder it : Nor will I allow of that, That Nature produceth living creatures by a miniture of heat and moifture, and moifture is alwayes as the matter for heat to make a concection of. For not only where moilture affords matter, and heat doth manifestly concoct it, are living creatures breed; but there also, (that we may not seem to set bounds to the power of God) where we see with our eyes that there is neither of these, nay where we may conceive that they are both absent. The generation of the creature called Pyrigonus in the flames, of Oripa in the most frozen snow, will evidently prove this, and that was the cause that I sooner subscribed to the generation of Worms in stones. Moreover, they that with their graving tool, do make rough their Milstones that are grown over smooth by using, find Worms oft-times bred in them, as the Brother of Pennius testified. Felix Platerus, the worthy President of the Phyfitians at Basil reported to me, that he found a great live Toad in the middle of a hard stone that was faw'd in funder, that was bred there. And that excellent man Zuingerus relates the same thing of a Scorpion. And indeed these things had seemed to me incredible and monstrous, had I not known the same thing to have happened in a Quarry of William Cave a Noble man of Leicester. And neither Philosophy nor reason is contrary to this opinion, since in the earth, the mother of all things, there is all kind of heat and moisture, and all kind of spirits; and (to use the words of a principall Physitian) all things seem almost to be

1082

full of all things. Nor can I fee the reason why stones should rather be bred in living Creatures. then living Creatures in stones; and as I shall easily grant that there are Minerall vapours in us, to I shall not fear but I may grant that there are animal spirits in them, and yet not wrong the truth For they have invilible and fecret passages, nervs, veins, and turnings, whereby they either draw to them strange moss turner, strange seeds and different vapours, or else receive them being brought thither. Some fay, that the marrow of a mans back will produce a most venemous Seident. Cardanus faith that Worms will breed of the ashes of Worms. Many Writers besides Plint report that Scorpions will breed from Basil buried between Walls. All men do see that Hones are bred in the air: And Bonus Ferrariensis is not ashamed to say that it hath rained Calfs, blond and stones, which things though they found harsh, and not to be true, yet I dare nor rashly deny it, nor doth this at all impaire the opinion we hold concerning Worms bred in flones. And if the reason of this seem to ly so deep, that it is too difficult for us to search out: you must think that truth lyeth so deep, and covered with so much darknesse, that it could not be found out till of late years. And in the generations of these things, (which God only knowes) truth will never shew it self but by conjectures, similitudes, collations, proportions, and observations. God doth here seem to scoffe and deride the arrogancy of worthlesse men, that dare look afquint into the work-house of Gods Creation, and are not afraid to inquire into the reasons, and to search and trie, and to attempt to imitate the works of God. I wish we could be admonished either by the punishment of Salmoneus, or by the counsell of Solomon, to learn more modefly: For that is the only way I know to the true knowledge of things, and the fafest for us to walk in.

CHAP. XIX.

Of Worms in Vegetables, that have fix feet, and first of Worms in trees.

Orms in Vegetables are either Worms in trees, or in shrubs or Pusse, or Corn, or Herbs. The Tree-worms some of them seed on the wood, some on the bark, some on the leaves, some on the fruit, and of all these we shall speak in order. Those that corrupt or ipoyl the wood are of divers forts, for those that breed in green and growing wood are called Γρίκας, those that breed in dry wood without sap, are called ἔτξυλα, those that are bred in solid and dry wood are called Thripes, those that breed in hotter kindes of wood are called Termites, those that breed in saw-dust are called Coffi, those that breed in planks of Ships are properly called Teredines. After it may be took their name from Idaren, for they do bite and eat living trees, fo that oft times about their roots a great deal of powder and dust may be seen, as if it came by fawing. This Worm hath an ill-favoured head, of divers colours, covered with a covering, and he can put it forth and draw it in at pleafure. His feet are on the hinder part toward his tayl, as the Coff have theirs on their breaft, the rest of the body is covered with a fandy Coat, as it were their shell, and when they put that off they die, as Snails out of their

In that time which Nature hath appointed they grow into a sheath like to an Aurelia, but what winged Creature cometh from that afterwards I could never yet observe. This is far greater than Collus, by reason of its unsatiable eating, and is not so dainty. The Wood-peckers and other Birds that spoyl the trees do make holes in the green trees, and by the found finding out the hollow places, they dig and pierce in there, till they come to those devouring Worms, and they devour them. For they exceedingly delight in this kinde of meat, and for love of it they will sometimes spend whole cayes in digging of a tree, Ergunor is found in rotten and hollow wood, which will make no noise though you tirike it with a staffe, it is very like to the Cerastes in Theophrastus, and the Pitiocampa of the Physicians, but that it hath only three feet on both fides. Gefner artributes to it a venemous and constant evil finell, and a very corroding faculty. Thripes are thought to be named from terendo wearing, they are little Worms very frequent and common, their bodies are white, their heads black, or brown from red, with fix very flender feet neer their neck, and blackish with a little red, like to the Worm in a Hazel-nut for the fashion of their bodies, but they are shorter and smaller in the middle; they love no black wood, but are bred only in wood that is whitish, (as is the white sap of Timber, Hazel-nut trees, Birch, Ginamon, the Plain-tree) and they penetrate into these when they are partly dry and solid, and drinking up the moysture they have, they make them rotten. I passe over the contests between Pliny, Hesichius, Theophrastus, Pluturch, concerning the fignification of Thrips, whereof fome are so negligent, some to curious in observing the properties of words, that in describing them they are very obscure, and as good as nothing. The Ancients used for Seals, the wood the Thripes had eaten, and chiefly the Laconians, as Hesichius testifieth. Whence Lucian in Lexiph. I keep them under seals eaten by Thripes. For these Worms as they eat forward, do engrave divers characters of herbs, and forms of living Creatures, and so exceed the Divine sculpture of Phidias, Praxiteles, Myrmecide, Bupulus, Sophroniscus, Anthermus. Galen speaks of a man that made Rings, 1. 17. de usu part. who on the broad part of a Ring engraved exactly, to a wonderfull demonstration of his art, Phaeton with his Chariot and Hories, call down headlong. But the Worm Thripr hath neither graving tool nor Iron instrument, but with his tost tooth engraves most solid Signets, and stames wonderfull pictures of all things sometimes, only by the conduct of Nature. When woods are dryed by overmuch heat of the Sun, they produce and feed a Worm called Termes, which as Servins faith, being bred out of the very puth, at last consumes its mother, and will not touch the hard barky substance. A very ungratefull little Creature, and so much worse then other Worms, the more it is hurtfull to the heart and vital fountain of trees: For they live tometimes when their bark and hard wood is devoured, but when the pith is wasted they die pre-

fently, and Nature can never cure this wound. They are like the Colli in shape of body, but they are farre lesse, and much softer. The name perchance comes from Kis a Greek word, as if you should call it a Wood-weevel. For the Philosopher faith that Kis is a little Creature bred in wood, like Worms bred in Corn; the English call them Timber-worms, because they are seldome in any wood but that which is cut, and prepared for building. Their bodies are full of wrinkles, and hence some Roman Consuls are called Coffi. The greater Cossi are almost as thick as the little finger, and as long as three ingers broad, of a whitish colour, almost like to the greater kinde of Catterpillers; wherefore the great ones are called by Pliny Coss. They have three feet on each lide that are pendulous, not farre from their heads, short, slender, and black. The bo-

dy of them hath twelve rings, those toward their tails are alwayes smaller and shining; their heads are somewhat thick, of a dark colour, and the nose is small, forked, sharp as a Spear, black, with two places in the forehead, neer the mouth there are small hairs that are pointed, all the rings in the fides are severally marked with red points, a little hollow. It is a Crear ture that creeps very flowly, and the motion can hardly be perceived, wherefore Festus calls them Coffi, great bellies, and fluggish Creatures. He hath very little eyes, a round back, a belly something hollow, of a waterish whitish colour; they seem to be fat, and very soft; they breed in wood newly cut, but before it ought to be. But if they have been long cut, and have lost much of their moviture, the small Cossi only breed in them, that differ from the great ones only in bignesse. The Ancients in Pontin and Phrygia (as Pliny and Hieronymus note) fed on these as the most dainty meat, and for that use they fatted them with meal, that they might be fed Worms. Pliny faith they serve also in physick; for they heal Ulcers, increase milk, and in Oyntments they cure creeping fores, which Albertus also confirms. The Teredines have a very great head, considering their bodies, they gnaw with their teeth, and pierce into Okes, as you may know by the noyse : But Theophrast we thinks that these are only found in the sea, and men think there is no other Worm can properly, be called Teredo. We remember, that in the Ships of the Venetians, that had long stood in the Havens of Alexandria, that little ones were found, that were a cubit long, and as thick as a mans thumb, such as that famous ones were round, that were a cubit long, and as thick as a mans thanhold here.

Sir Francis Drake another Sea Neptune brought home with him, in his Ship that had gone over the world, and was grown rotten and ipongy, We faw other Teredines an inch long, like to Worms bred in flower; they have a red body, a yellow shining head, a little red, a forked mouth, from the lips whereof little thorny hairs come forth, they have

three feet on each fide, the incisions of their backs are eleven, something red: The rest of the body is of a watry yellow, and shines, These three the greater they are the more darkly they shine, of a Crimson colour, were found in and the leffer they are, the whiter they are. The Italians call them rotten logs. Bysam, the Spaniards Bromam, from the enting of them, for they eat Ships, and penetrate them; whence Aristophanes in Equitibus, brings in a rotten Galley, speaking thus, I being eaten by the Teredines am accused for it. And Ovid faith thus, 1. de Ponto. It's eaten as a rotten Ship with Worms. By Pennius his leave, the Terediues eat not only Ships, but beams of houses, so the Scholiast upon Homer saith, (Odys. 10.) The words are these. Melampus whose ears Drace had picked, that he might I found this in words are triefe. Melampus whole gars inace had picked that the ingut of a understand the voices of wilde beasts, was cast into prison for the Oxen the root of a understand the voices of wilde beasts, was cast into prison for the Oxen the root of a understand the voices of wilde beasts, was cast into prison for the Oxen the root of a understand by the speech of it feeds on the Teredines, that there was but little of a main beam left, he caused him-earth-worms. felf to be brought forthy left it should fall and kill him; and whilft he biting them was lifted up by a man and a woman, and got forth, the house fell, and continually, was lifted up by a man and a woman, and got forth, the nome test, and fucking both of them were flayn. That is also apparent out of the chief of them till they the Latine Comedians, when he brings in Philolaches a young man, be dir. speaking to them in thele words;

If tempest comes, Tereda enters, And the rain at all adventures, Gets in, and rots the walls and wood, Makes work for Carpenters, that's good, Orc.

Thee

ΘN1.

L.p.S. AJV.

Book IL

These hurt especially great trees, as the Oak, the Pear-tree, the Apple-tree, the Cheinut, the Larch. Walnut, Beech, the Medlar, the Elm, and broad loafed Willows: in which cut unleafor nably, or planted, a foft and ill fatty humour breeds (which Wood-men call, the fap, and the white) which is the matter and nourishment of all the Teredines. Trees that are drier, more birrer, more oily and hard, are thought to be so much the freer from these Worms: yet some times they will offer violence to the Cypress-tree, the Walnut, the Guaiacum, the Tiele-tree, and to Ebony it felf. The manner of their breeding in wood is thus: Many are bred within, and do not come from without, and they ear up their original, that of what they were bred they may live by the same. The material and conjunct cause is the sweet moissure of wood that is fit for their nourishment, being corrupted, even as of sweet flegm, worms are bred in the belly. Now that tweet humour purrenes from a twofold cause, either by distemper, or solution of continuity. By diffemper the quality is corrupted, and by cutting not only the inbred humour runs forth, but fome strange humour enters by rain and milts, and corrupts the wood. In old spongy, and dry rees, by reason of age, are the greater Worms, both because the radical mostlure is more diminified, and because the distemper, heat and mossifure that are strangers, are more augmented: as oft-times old men are troubled with cruel scabs, and eating fores, and Worms. Wood lying open to the Moon in the night, sooner breeds Worms, because of the over much mouthure of the air, and in the hotter Sun, from too much heat. Those that breed within, breed at all times, but for those that come from without, and are bred of the seed of Unats and Flies; the Spring and Summer are the chief times for them; for in Winter they are frozen and dye. Also the climate and the ground are of great force, for the Irish wood seldome corrupts, there is such vertue in the ground, and in Arabia, in the climate. Now we shall describe the particulars.

Of those Worms that are in Fig-trees, some are bred of the trees themselves, and another is bred withall, that is called Cerafts. For fince the greatest part of Worms do dister in shape and form one from another, yet the principal difference amongst them is this, that those which are bred in one kinde of tree or fruit, if they be translated to another kinde, they will not live; yet men affirm that Ceraftes is bred in the Olive-tree, and will breed in the Fig-tree; wherefore the Fig-tree hath its Worms, and sends forth those also that it receives from other trees: yet they are all like to Cerafter, and they make a small shrill found. Sypontinus faith he hath two horns on his head: when he hath earen the place so hollow that he can well turn himself, he begets

another little creature, and changeth one kinde into another as Catterpillers do.

The Service tree is inteffed with red Worms, and hairy, and then it dyes. Also the Medlartree being old produceth such Worms, but they are greater then in other trees, as Theophrasius writes. The fap produceth a Worm like to a Thrips, from whence Gnats and kindes of Phaleuci are bred, wilde Pear-tree Worms, some fort of living Creatures that seed on wood, saith Hespehius, for they extremely hurt wilde Pear-trees. A little Worm in the Oke-like tree (Suetonius calls it Galbus) is wonderfull flender, whence the first of the Sulpiris was called Galba, from his extreme stendernesse. The Palm-tree producert the Carabus (as Hespenius and Anssaule testiste) a Worm like to Sea-lobsters, having only six seet; by this means the Carabick Worm of Hespenius is known: Theophrasius writes that they cut off the small boughs of the Cinamon tree, two fingers length, and when they are green they fow them up in Ox-hides; then they fay that these boughs corrupting will breed Worms that eat the wood, and will by no means touch the bark, because it is tharp. This wood was teen in Pennius his house, eaten by a Worm that was of an Ash-colour, it was not very hard, but had neither taste nor smell; contrary to that some Portingal Merchants and Quackialvers that are ignorant of simples assum. The Worms called Ranca, breed in the root of the Oak, and huit it. Pliny faith, an Olive-tree is ill planted where an Oake is dug up, for the Worm Ranca left in the roots of the Oak, creep into the roots of the Olivertree and order of the Oak of of the Olive-tree, and endamage them. Johannes de Chanl affirms the same. The Ancients reckon up but few worms that feed on bark, except the Scolopendre, Juli, and those Moths that are like little Scorpions, whose nature we explained in the Chapter of the Scorpion. The Germans call these Clops, they are not much greater than a Flea, of a red colour, with ten feet, they are frequent in the wood and horses of the Muscovites built of Pine-tree : in the day they feed on the mouture of the wood that sweats forth between the bark. In the night they creep out, and if they light upon men that are afleep, they will fuck out their bloud, biring painfully. The Worms called Syrones feed on the leaves and flowers of trees, how small they are in thickness we worms called Syrones teed on the leaves and flowers of trees, how finall they are in thicknels we may conjecture from this, that it creeps between the membranes of the thinnest leaf, digging, and not hurting either outward skin. Nextto the Worms in vinegar (faith footh. Cameringin) Inever faw a Worm fo compact. The mines that it makes do sometimes represent the most fine lines and fibres. They hurt exceedingly the leaves of the Cherry-trees and the Apple-tree has are spotted; and when they are full they fall off; and they feem to be formed of many Pompion-seed glewed broad waiss together, but that they are far smaller. From these when they are dead another small Insect at they are they grew from another. "August, are like to Syrongs which the English, whether they breed in wood, or bark, leaf, or flower, or strains of trees, as in Cheese or Max, call Mites that is very lirtle ones, or steamer they drow Syrongs by this, that they Wax, call Mites, that is very little ones, or Alomes; they differ from Syrones by this, that they feem to be made of many Acari. But the Acarus it felf is a round white fix-footed little creature like to a little Lowse, of almost no substance, that if you press it violently between your fingers and your thumb, it is so small that you cannot seel it nor hurt it. Antigonus and Aristetle

call it Jupiters Butler, it may be because it will eat with its nib into the thickest Wine-cask. And certainly if the e were not formthing of God in it, and of divine vertue, how could we finde fo great force in fo little and almost no body? Also in the leaves of the Beech, little knots are found wherein there are small Worms. The fruits of trees (as Theophraft in saith) are sometimes worm-eaten, when they are yet green, as we fee in Services, Medlers, Peats and Apples. The Olive both in the skin and kernel hath Worms called topmes, and it is a mitchief not to be neglected (faith Theophrastus) for it will not only waste all the oyl and the mice, but will eat up the stones that are so hard wherein the kernel is. Also little Worms are sound in Galls that are eaten through, and they are bred in the very inmost pith, out of which afterwards arrient a kinde of Flies and Gnats, as Valerandus Doures an Apothecary of Lions tellifieth. Moreover, in Oak Acorns, and spongy Apples, sometimes Worms breed, and Attrologers presage that year to be likely to produce a great famine and dearth. I need not contend that there are Worms in small Nuts for all men know it: especially when the Summer is moilt, and the wind blowes from the South. It is strange that Ringelbergim writes, lib.de experiment, that there Worms may be sed to be as big as a Serpent, with sheeps milk, yet Cardanus confirms the same, and shewes the way to feed them, Lib.dever. varietat. There are little Worms bred in dry Figs like those in Hazel-nuts, with a black head, and the rest of the body is a whitish yellow, but they are smaller, Bellonius faith he found that Cedar as well as Pine Apples were fib eet to Worms. They are for thickness like to the female Glow-worm, a fingers breadth long, with a head like an Emmet, but more compact, with twelve incisions; on each ide it bath three seet near to the head, and two circular foreyards, with a thick belly, and a fharp tail. Also in the hard and woody hulls of the Witch-tree, there is a broad feed, and oft-times eaten with Worms; and you shall finde there ofttimes their very Aurelia's. Lattly, no fruit can be named, but some Moth or Worm will inteit it; even Mannait felf fometimes (which the Poets feign to be the meat of the gods, the Scriptures maintain to be the meat of the fons of God) corrupted and bred Worms, when contrary to Gods Word it was laid up till morning.

Of lesser living Creatures.

Снар. ХХ.

Of Worms of Fruits, Pulse, Corn, Vines, Herbs.

Pon the lower Willow (especially when swelling gals break forth) sometimes there are found like to roses, that are full of Worms, as it also happens in the leaves of the Maflick-tree. Quinqueranus faith there are two kindes of scarlet Oakone like a great tree, the other a small shrub, about a foot and half high; it spreads very broad, and the seaves are smooth and fining, with a numerous thorny beard in the circumference riting up with many fiences like to the Rose-bush. Our Countreymen call it a Beech-tree, though it be nothing like to a Beech-tree. It growes on plain ground, but that flands high, with little dry hillocks, and unfruitfull: when the fhrubs are bedewed with showers in the midst, of the Spring, the Cochineal begins thus: When the lower stalk divides into two branches, and in the middle of these there comes forth a thing that is round, and of the colour and bigness of a Pear, they call this the Moaher, because from this the other grains proceed. Besides every one of these shrubs hath combionly five Mothers, which at the beginning of Summer and in hot weather put forth a great company of little Worms, and they cleave in the top. A new off-spring of shoots growes up severally on high of a white colour, that produce living creatures. But wherefoever they incer, with the hollow places of the twig budding where the Worms are, they fall down, and become as greats as Miller-leed. Then growing up more freely, the white colour changeth into ash-colour, and then they appear no more living creatures, but again like unto Pease. Then those grains being ripe gathered, now great with colour'd Worms: whileft they are carried to the Merchants, the thin skin that goes about them breaks. The price of a pound of these Worms that are come forth of the skin is a gold noble; but that part which is set in the skin, is fold for a fourth part of it: the mean while the little Worms are as if they were dead, and move not. But when the feafon of the year comes, they are hafined by putting them in linnen cloths, and exposing them to the Sun. Then but feeling the heat, they prefently creep forth, and fluxe to fly away; but by the keeper of them, who watcheth them continually, they are shaked bock into the middle of the linnen cloth till they die; whilest this is doing, and for three daies after, there is so sweet a smell and delightful, that no Civet, Musk, or Amber-greece, nor yet Lemon flowers can surpass it. But if any grains escape from him that gathers them, they presently send forth a numerous

It was observed one year, that in a stony field in the Countrey by Arles, the profit of this increase army of winged creatures into the air. was reckoned at 11000 crowns. So writes Quinqueranus. And Carolus Clusius satthsthat in his time, the same fashion of gathering Cochineal was observ'd about Narbon in France, and also in Spain. For they have plats of ground in the open air provided for the purpose, with the fides something high, and they lay a linnen cloth upon them and pour forth the Cochineal upon that; the keepers standready about it with little wands continually when the Sun shines very hot, and they

Fig-tree Worms,

CHAP. 20.

strike the outsides of the linnen cloth, that they may drive back into the middle of the cloth these little Worms that hasten to come forth. But Petrus Bellonius 1. 1. observ. c. 17. tels us of another manner of preparing Cochineal.

There is (faith he) in Crete a great increase of Cochineal: shepherds and boyes do gather it. They finde it in June upon a small shrub, of a kinde of holm that bears Acorns slicking to the Hock of that shrub, without any stalk, and the colour is ash-colour with white, but because the leaves of that fhrubare full of prickles like to Holly, the Shepherds have a staffe in their left hands to press down the boughs, and hold them so; and in their right hands they have a pruning knife, wherewith the cut off the final boughs, from which they pull off little round bladders as great as smal peale, on that side they grew to the wood they are chapt and open, full of little red creatures smaller than nits, that fly forth at that cleft, and leave the bladder empty. The boyes when they have gathered their Cochineal, bring it to the Treasurer, and he gives them victuals for it. He parts these little creatures from the bladders with a sieve, and then he takes them gently with the tops of his fingers, and makes bals of them as great as Hens eggs: for should be preis them too hard, they would turn to juice, and the colour be loft: wherefore there are two kindes of dying stuffe, one of the pulp, another of the bladders, and because the pulp is more usefull for dying, the price of that is four times beyond the price of the bladders. Gefner also faw small Worms of a yellowand red, upon the uppermost boughs of the Juniper-tree; in the sponge of the Eglantine or wilde Rose, white worms breed, from which Aristotle saith that Cantharides do come. Gefner faith, that after two moneths the sponge being kept in a store will send forth a great number of little live Worms. Also the Thorn and the Brambles the Rose, Heath, Broom tree Trifoly, Raspis, the Myrtle-tree, Capers, Bush, the Goosberry-bush, the Palm-tree, the white Thorn, the Priver, Park-leaves, Licorice, and indeed every fhrub, and under-shrub is earen by Worms : nor could Palma Christi (which afforded shadow to Ionas, that divine Prophet, when he was very hot) escape this plague, as we finde it written. Also Pulie, the gifts of Ceres, are (to use the Philosophers word) most Worm-eaten, but how that comes to pais is most uncertain; whether is it, as Theophrastus seems to say, when the juice cannot be diffused, by reason of the great heat, and the foulness of them? or should we rather say, that the dry part desires the humour, but the humour fices from it as its contrary? So we fee drops hanging on a dry wall: or whether the over great heat corrupts both the natural heat and moilture contained within? That corruption comes that way, most fickly Athiopia can testifie. A little worm eats Beans, Theophrastus cals it Midas, and Hespelius Triene, Troit, and Mraumsport, is a worm breeding in Philesbut chiefly in Peafe, and hath its name from eating: and fuch a one breeds in chich Peafon, after that the faltness of it is washed away with showers, as besides the Scholiast upon Hessed, Phavorina, and Theophrastis determine. They often breed in the sweeter Pulse, both by reason of the fitness of the nourishment, and the nature of the air fit to breed worms, and when they are bred they nourish them, and shew them forth. Worms bred in corn are generally called Johnson, which feed on the roots, stalks, reeds, and prickles of winter Wheat, Panick, Oats, Rice, Miller, Rie; others there are that feed upon Wheat-flour, as those that are called Farinarii; others of that which is whole Wheat, not yet ground in a mill, as Weevils. The English call the Farinaris Meal-worms; they are like to ships worms, they have fix feet, with a little shining red head, a round body, and divers coloured as the meal is: for the best and whitest meal breeds them white, the elder meal breeds them yellow, the lean meal full of bran hath dark colour'd. Cardas cals them Meal-moths, (but as it fals out frequently) not well confidering of it. Those that

are fed with bran, it is wonderful how great they will grow, and from ten in a short time you shall finde three hundred. They are found amongst woollen weavers at all times almost; for they make a mixture of Bran, Vinegar, and Hogs greafe, from whence they breed abundantly. The Weevil is the bane of wholeWheat, be it raw or torrefied (as

in Birn of Actius (which the English call Mault, the mother of Ale.) For so my Comedian hath it, though Virgit and Varro call it Gurgulio or Curgulio. The English call the Wheat-worm Kis, Pope, Bowde, Weevil, and Wibil, as if you should say double Bill, yet it is indeed a living creature with three beaks. It destroyes wheat chiefly, yet it will destroy any other grain, leaving nothing but the hull, and the thin skin. For as Virgil hath it in his Georgicks:

The Weevil spoils a mighty heap of corn.

It is formed like a fnull Beetle, it hath a beck proper to it felf, and with three forks. Some of them are with black bodies, others with brown, but others that are the greater are greenish, and the middle of their body very small. This creature is so dry, that with the least touch it will turn to dust. It is bred chiefly in the Spring, some few daies before that Bees swarm. Theophrafru faith they breed of one part of the grain, and the other part they feed on. Our Countreymen finde by experience that this wheat-worm will lay eggs in chinks of wals, and under the tyles, and from thence by procreation comes a new off-ipring. They speak of three wonders concerning these little creatures. First, that though they be but sew at first, yet in a short time they will increase infinitely. Secondly, that they will lie between the ryles and in chinks of wals without any meat at least three years. Thirdly, that if they be put into water three daies

with Wheat or Barly, when they are taken forth they willive again. Our Countreyman Siliardus (a diligent observer of Nature) describes the propagation of Weevils thus: when Ants have eaten off the top of the ear of wheat, the Weevill goes up, and in that little hole he laies one or two eggs (but feldom three) fo great as a grain of Miller, long and yellow, full of liquid yellow matter; from this afterwards proceedeth another Weevill. This little Infect hath both fexes, for they copulate before they do this mischief. Petrus Comestor assums that they proceed from Beans corrupted, to whom no man but Guillerinus de Conchis affents, lest they should faisly confound a Weevil with Midas, or Bean-worm. Belide this Weevil commonly known, Joach. Camerariss fent two others to Penniss out of the barns of Germany, with a far greater belly; one of them was a kinde of ash-colour, and the other green. Also Scaliger faith there is in wheat a worm without a beck, which perhaps Pliny meant by his corn-beetle. To this I will refer a cerrain little creature that is frequent in barns, that creeps with fix feet, and with two short failvards it tries its way, it is sported on the middle of its back and sides, and the rest of the body is black, which I therefore call the spotted Weevil. This creature doth no great harmto com, because it is still alone, and seldom two of them are found in one barn. About Lentzbourg, a Town of Germany, a certain infect is found in the fields, which tome call Ulput, some Korn-worm, others Kornevele. It is faid to be so venomous and huttful, that the Husbandmen will leave their plough when they meet it, and run after it to kill it. It is black from a little red, dwelling amongst wheat and eating up the corn : worms bred in Vines, the skarlet Oak worms are like them, fuch as Braffavolus doth throngly maintain and think that they are bred on the roots of Pimpernel. Amongst herbs, both for physick, and for meat, the Violet, Radish, Rue, Basil, and many more are molefled with worms. The worms in Violets are very small and black, and run very fast, as facobus Guretus a most diligent Apothecary, and very famous in the knowledge of simples as there are not many, affirms, out of the root of the Hartichoak a worm comes, that hath fix feet, like to a Catserpiller, and whitish, with a reddish black head; where it bites the roots of Harrichoaks it makes them black, and at last kils them. The Radish produceth the like. Cardan saith, men report that there is a worm found in the leaves of Rue, and it will grow wonderful great, as the Hazel-nut worm will do if it be fed with sheeps milk. A little worm that is the childe of the dew, and a guest in basil with a body almost upright, he sticks fast by his hinder feet, whilest he takes hold with his forefeer. Sugar is made of the Sugar cane, the sweetest of all Salts, and as the common fort of Phylicians suppose, it is altogether free from corruption. Yet under the authority of Scaliger, I affert that a little worm is bred in Sugar, long, black as a flea, and (if you take away his beck) like to a Weevil; and therefore we may justly call it a Sugar-worm. Bellonius also makes mention of this. But that Insest which the Germans call Mayen Wormlen seems to breed very seldom, saith Camerarius. For in the moneth of May dewes often fall that are very unhealthful, and if they fall upon the leaves of Hops, they turn to little living creatures called Hoppen. Amongst thousands of these you shall sometimes see one far greater than the rest (though it is scarse greater than a fat lowse) it hath yellow circles about the belly, the back is chamser'd, the tail is formewhat long, the colour of the body for the greatest part is blackish. This when it wants aliment from dew, devours one by one all of his own kinde, ever beginning with that is next to him : he changeth his skin like to Silk-worms : lastly, when he is almost transparent, he putting off his last skin, he hangs by his head and feet by a kinde of thin bird-lime, by some leaf, and so he dies: why may we not call this worm the Hop-worm? In the stalk of the Asphodil, a worm is bred of a clear colour when the herb begins to flower, out of his shoulders wings grow by degrees, and then when he can fly, he forfakes his habitation. In the swoln joynts of the codded Arsmart, and the wilde Thistle, little white worms breed, as yellow ones do in the purple flowers of the bastard wilde Chervil, and red ones in the root of Pimpernel. I often have seen in the female Smallage downy worms; in Mushroms and Coleworts, imall black worms; in the root of Acorus, white ones: in the root of Elecampane whilest it is green and growing, white worms breed inten or eleven joynts that are vifible, that are as thick as a Goofquil, with a litblack head, and fix fhort feet, and the body all black. The Kings of the Indians, as Alian teffifieth, use to eat for their second course, a worm found in a certain plant, when it is rosted at the fire, and they commend it for the daintiest and sweetest meat. In the head or stalk of the Fullers Teafil, we have seen a worm very small, with a little head, and fix black feet, with ten or eleven incisions. First it eats up the spongy pith of the stalk, and when that fails it dies for want of food. It is easily found at the beginning of October, though Marcellus upon Dioscorides, doth most shamefully deny it. If I am not deceived, this is that worm the Ancients call Tatinum. Xenocrates cals a plant like to double Camomel Galedragon, (faith Pliny) it hath a stalk like Fermel Gigint, with a tall and prickly head, and like to an egg in form: in this with age they say little worms breed, that are good against the tooth-ach.

Of lesser living Creatures.

In the roots of white Thiffle (which plant is luxuriant in the high mountains of Savoy) there is a little worm found, breeding in some, in others it growes great, and in most of them it grows to have wings and ready to fly; it is white, and hath some joynts that it is divided by, and very black fhining eyes. It may be there is great use in physick of a little worm bred in wilde Tansey: but I leave the enquiry of that to those that are curious in the secrets of Nature.

a worm and took that from him, both to try his patience, and demonstrate his frailty. There was an Arch-bishop of Tarke, whose surname was Grey, as our Hiltories relate, when he had

abundance of all Corn in the time of great scarcity, yet he refused to det the poor have victor

mad

CHAP. XXI.

Concerning the use of Worms that breed in Minerals and Vegetables, and the way to destroy them.

One think that worms that are bred inflones, (whereof we speak) those I mean that are as Sgreat as Hand-worms, beaten into powder with the flone, are good to cure Ulcers. Alfo Marcellus witnesseth that these bruised and given with three Cyathi of water, will break and drive forth the Stone by urine. The Ancients used the more solid wood that the Thripes had carved with their teeth for Seals, and Antiquity ascribeth the invention of that to Hereles. In old trees red worms breed, whereof Serenus writes thus.

> From an old tree do but red worms procure, Bruise them with Oyl, and dropt in warm, be sure, For pains oth' ears this is the (afest cure.

Galen out of Apollonius subscribes this remedy. Worms that breed in hollow and rotten trees heal fecret Ulcers and all symptomes of Ulcers, and diseases of the head; also being burnt and powdered with their weight of dry Dill, they cure Cankers. Marcellus. But Actius addes three Worms bied of wood to an Oyntment against the Elephantiasis, which he learned of a certain Physician that took his oath of secrecy. The rottennesse that is made by their biting dries without pain, and is profitable for many things. Galen Enpor. 3 c. 7. Commends this kinde of powder, against knobs, clifts, and fores of the Fundament. Take Orpiment in pieces three ounces, rotten wood of an Oke four ounces, make a fine powder, then foment the place affected first with the warm urine of a young boy, and afterwards strew on this powder, But the Coffi are not only food for the Inhabitants of Pontus and Phrygia, and they delight much in them (as Worms in Cheefe are to the Germans) but they also cure Ulcers, increase milk, and as Pliny faith, when they are burnt to ashes they cure creeping fores. The Worm in Fullers Teazil put into a hollow tooth, will give wonderfull eate. Plim. And if it be hanged in a bladder about the neck and arms, it will cure Quartane Agues. Dioseorides. One Samuel Quickelbergius a learned young man, in an Epittle he writ to D. Gefner, hath these words, Saith he, as I was gathering of Simples, a certain old man came unto me whilft I tought for a little Worm in the head of the Fulle's Teazill, and he faid unto me, O thou happy young man, if thou didft but certainly know the fectet vertues of that little Worm, which are many and grear. And when I intreated him, that he would acquaint me with them, he held his peace, and by no intreaty could I obtain it of him. Pliny afferts that the Colewort Catterpillars being but touched with it will fall and die. The Worms of Galedracon (which plant some men confound with Fullers Teazil) being put into a box, and bound with bread to the armonthat fide the toorh akes, will wonderfully remove the pain, faith Xenocrates. The Worms of the Eglantine will cause sleep, and therefore some Germans call them Schlafeirs: They are applyed alive to a Felon (but alwayes their number must be odde) and they do certainly cure it saith Quicketbergius. A little Worm found in the herb Carduns, bound up in a piece of Skarlet and hang'd about the neck, will cure the tooth-ache. Marcellus. The Worms that are found in the root of Pimpernel, make a most incomparable purple colour, (Gefner) that I wonder the Ancients said nothing of them. All little Worms found in prickly herbs, if any meat slick in the narrow pallage of the throat of children, will presently help them. Pliny. Rub a faulty tooth with the Worms in Coleworts, and it will in a few dayes fall forth it self. Meal-worms are good and feem to be bred to catch black-heads, and Nightingales, and to feed them; nor is there in winter wholesomer meat for them: for they purge, heat, and nourish also, those Birds that have but a thin nutriment to preferve them. I fpake before of the profitablenesse of the Cochineel Worms. Brassavolus affirms the same of Vine-worms, but how rightly let others judge; but they are not only good for dying, but necessary in Physick, for they both binde and cry, and fcowr without biting, and incarnate also, they care theumatick eyes, mingled with Pigeons bloud, they help fuffulions of the eyes, they cure Dysenteries, they help hard labour in Childe-birth, and debility, they cure Melancholy, fear, Epilepties, they provoke urine and the terms, they hear the Matrix, they diffolye water and choler, they abate the panting of the heart, and upon that score they are put into Consection of Alkermes, and are the Basis thereof. Diofeor. Avicen, Kiranides. I say nothing, how greedily Sparrows, Wood-peckers, Hens, Wood-cocks, Snipes, the Pardus, a Black-bird, Larks, Gnat-mappers, Reed-parrows, and many other birds, that are good physick, or else meat for us, do feed on the Worms of trees and he bs. Now fince God hath mingled conveniences and inconveniences together, both to rouse up our providentiall prudence, and to punish us with punishments due to our fins, how both of these may be prevented I shall show briefly. Jonas being cherished under the shadow of the Gourd, he thought it fafe and happy to be so, when the heat was so vehement. But Godsent

als either for money or intreaty. A little after this his barns that were full of Corn, were fo exhausted with Weevils, that they left not one whole grain of Wheat or Barley: Even as Solomon faid, He that hoards up his Corn the people shall curfe him, but bleffing shall be on the head of him that selleth it. So God, that he may call forth a sluggish father or a family, sends the Moths and Worms into his Orchards and fields, both to make him laborious by this means, and also to teach him to make use of such helps and means that God offers to him. Our Arcestors have delivered by tradition many of these: But because Cato, Vitruvius, Plinj, Palladius, Theophrastus, Columella, Varro, Virgil, and many of those that were Princes in husbandry,

CHAP. 21.

have abundantly fet down these things, we shall only give you a smack of them here, because others have given a full draught. That trees may not be eaten with worms, plant them in the new of the Moon, and cut them down between the new and old Moon in the conjunction. Also anowat them with Tarre, and often wet them with the less of Oyl. Also keep them under Covert, every where, that they may not stand exposed either to great heat of the im or tempests of weather. Also that trees may not grow worm-eaten, anoynt their roots be fore the first planting of them, and then afterwards moysten their roots with mans urine and a third part of the strongest vinegar. Some steep a long while Squills with Lupins, and they fprinkle the places that are worm-eaten or presse out their liquor with a Sponge, or they besmear the stock of the tree till it be very wet, and they powr into the holes Bitumen mingled with Oyl. Others sprinkle on quick-lime, others Oyl-lees and old pille, others Hogs or Dogs dung steept in Asses pisse, the roots being first uncovered. Democrieus taught men to bruise Terra Lemnia with water, (it may be he meant Carpenters red) and to smear them with that: Some pick out the Worm with a brasse pin and put Cow-dung over the hole. Red hairy Worms fearch to the inward pith, if you can draw these forth and not break them, and burn them hard by, it is reported that all the rest will dy with it. It is good also to powr often upon the roots, Bulls gall, and lees of Oyl: To plant Squills, Rue, Worm-wood hard by, to make amenstruous woman passe over the place often, to smear the pruning knifes with Oyl of Cantharides, and to avoid lean and dry ground. By these remedies Oranges, Peaches, Pomegranates, Quinces, Pears, Apples, Olives, and Okes, and other trees are kept found a long time, and almost free from Worms. Ashes laid to fig-trees, drive away Worms, for it hath the force of falr, though not so strong. The seeds of Fig-trees or kernels will not be eaten by Worms, if a slip of the Mastick tree or Turpentine tree be set by them. As for Vines, Active bids us to sprinkle Sea-cole with water, and cast upon the place in the Spring-time, and then to smear the roots of the Vines that begin to bud. For if you smear the printing knife with Goats fuet or Frogs bloud, or do but anount the Whet-Rone with it, worms will not breed there. Africanus faith that the tears of the Vine mingled with the affres of the Vinestalks, and put on the root with Wine, it will do as much. Lastly they are killed with a finne of Oxedung, Harts-horn, Goars-clawes, Lilly-roots, shavings of Ivory, womens hair. The herb Pionie or Thornw-war, planted where Vines grow, drive away worms, Some there are that boy! Affa fetida, and Lazerwort in Oyl, and anount the frocks of Vines with it (beginning at the root) or with Garlick bruised. The feeds that must be fowed, should be kept in a Tortoise-shell, or Mints are to be fowed amongst Pot-herbs, but chiefly Tares. The bruifed leaves of the Cypresse-tree mingled with them, will avail much. Agregator.

And Palladine faith that all feeds will be free from wornts, if a little before you tow them you toke them in the juice of wilde Cucumbers. Pliny bids to prepare feeds of Lupins before you fow them, in the smoke or some hot place, because in a moyst place the worms will eat up the middle of ity and make it barren. Varro faith that worms will never touch Onyons that are fee with falt and Vinegar. Moreover, the feeds of all por-herbs wer with the juice of Houseek, will admit of no worms. Against Weevils, that are a certain plague to Corn, it is good to dawb the walls with line and hair both within and without. Others do for two dayes steep the fruit and leaves of wilde Cucumbers in lime water, and with sand they mould it up like plaister, and with that they plaister the insides of their Granaries; though Pliny writes that Quick-lime is a very great enemy to Corn. Some put beasts pisse to the

Vellels half full of hot water, that the Corn may lie almost up to the mouth brims of the Vellels; for thus they think the weevils are taken or destroyed. Some shut up an Ant-hill and Ants together in a bag, and after that they powr it forth in a corner of the granary: thus in ten dairs will the Airs destroy all the Weevils, and when they are killed, they take them and carry them forth, that are going back to their former house. Also they use to put into that place young Chickens that will soonest

lime, some worm-wood, suice of great Honsleck, and hops, others powr on the ground Oyl-

lees, Herring pickle, and the decoction of Plea-bane. Strabe mingles Marle, Others report

that often familing of wheat keeps it fafe from weevils; but Columella deries this to be

true. Care lib. de re ruftica, commends Clay mingled with Oyl-lees, and he would have the

Granary to be senced with that. Perro weeth it almost the very same way, but he commends

Clay with Oyl-lees, Maple tree and Com mingled together. Our English men do deceive

and destroy them divers wayes. Some in the middle of the heap of Com do so place braffe

1000

ub all the weevils. Some sprinkle on falt water where Garlicke hath been influed or Hops, Elder-leaves, worm-wood, Rues Nigella feed, wilde Mints, Walnut leaves, Satoury, Lavender, Southern-wood, Flea-wart, Bean Trifoly, boyld in Vinegar of Squills. They are much deliphied with Navew feeds, for the sweetnesse of them, that they will leave the Corn for that and ed with Navew lectus, for the Investment of Investment but also in preserving them, and preparing them, and to purge them from inbred or inflicted venome, and from putrefaction and worms, arraglarian and soresident and the same

CHAP.XXII.

Of the fix footed Worms of living Creatures, and first of Lice in men.

A Lowie.

The Name.

Q Ince God hath given the principality to man among living. Creatures, we will begin with him. In the first beginning, whilest man was in his innocency, and free from wickednesse, he was subject to no corruption and fifth, but when he was seduced by the wickednesse of that great and cumning deceiver, and proudly affected to know as much as God know.

God humbled him with divers diseases, and divers sorts of Worms, with Lice, Hand-worms, Belly-worms, others call Termites, small Nits, and Acates: Acastus, Alemaon, Rhericides, Pharaob King of Egypt, Cassander son of Antipater, Democratus, Calisthenes, Olynthins, Scylla the Dictator, and that river of Eloquence Hered, knew it to be true that I write, who perishing with a Lowfy disease, used Physicks, and Baths in vain, for they died miserably of them. Some also write that Plate (being elevated perhaps more then he ought, and so wife that he disdained others) died of this disease, whence grew the Proverb, Plases Lice. I shall say nothing of their the second a most cruel, Tyrant, and Theodorus that propagated Arianisms, two
Kings of the Vandals I let passe Arnulphus an Emperour, and an esseminate
Sodomite, and Casar Maximus a filthy Pander, all consumed with Lice, who found that when God commands, the least and most contemptible Creature hath force enough to destroy finners, and wish Pharaob they were compelled

to acknowledge this to be the finger of God.

The Hebremes call a Lowie Kifim, and Chinnam, the Greeks offices, Begunar, ripus, topes, milestus, sympes, the Italians Pidocchio, the Spaniards Piecio, the French Pon, the Germans Luff, the English Lowfe. The Latines call it Pes, as we read in Planens in Curonl. Wherefore 30m are akinde of Lions, and like Flies, Gnats; Lice and Fleas, you trouble all mens and are hated by all, but never do any good. And Livy to Gladolus, Are they Fleas. Wood-lice or Lice? As free me. And fucilius when he fees me, he fereiches his heads and picks Lice. Feffus. Where Rill a Lowis is called Res. It is a heaftly Greature, and known better in Innas and Armies then it is wellcome. The profit it bringerh, Achilles sheweth, Iliad 1. in shese words: Imake 10 more of him them I doe of a Lowfe, as we have an English Proverb of a poor man, He is not reacted. A Lowfe, The Lice that stouble men are either tame or wilde ones, those the English Gall Lices and these Crab-lices the North English call them Pers-lices that is a peculant Lowfe, formprehending both kindes, it is a certain ligh of misry, and is sometimes the inevitable Description of scourse of God. The tame ones that breed of corrupt blond, are less, and reddish from their different Fleame white, stom melancholy and adult humours, black, and, from mist humours they are ces.

Of divers colours, as Petrus Gregorius noted 1, 32. If you not them cently between your fine Luff, the English Lowse. The Latines call it Per, as we read in Planens in Curcul, Wherefore of divers colours, as Petrus Gregorius noted 1,33. If you not them gently between your fine gers you shall see them sour-square, and something harder than Fleas, whence in the dark when you take them you may easily finde the difference. They that breed in the head are biggers longers blacker and swifter, those that breed in the body are fatters bigger bellies, flower, darkish white, and marked with blackish freaks. Some constantly affirm, that in May they have feen Lice with wings, and that the Locust eaters of Lybia, when shey have fed ago plentifully of them, after they come to be forty years old, will the with she Lice as Joo plentifully of them, after they come to be forty years old, will die with shele Lice, as Diodorns Siculus shith considerty, 4. Antiquitat. Agatharcides speaks of these Lice, but he saith they are like to Ticks. They chiefly fasten on the chin, eyestrowes, and the privites still of hair, the groin, and the arm pits, their holdy is more compact, their his is sharper, they bits more, and tickle lesse. For Tykes will sometime enter deep, into, the skin, will their note; that you can hardly pull them out but with the losse of their heads, and they seldome want der, but they hire cruelly, and make themselves a hollow place, and they seldome want Some call these Lice in Latine Sicci, some mens Tikes, others, Multures lices. Aristote calls them wilde Lice, Hist. Animal. 1. 5. c. 31. it is harder then a tame Lowis, and is more hardly removed from the place is bites. Our French men, saith, forherms, call them. Morpion, and Patte, the German, call them. Fenter tents, Gordonius Pessonaus, call them. Fenter tents, Gordonius Pessonaus, they fistly very fast to the skin, or bite through the custicula; they are of a dryer matter, and that which is half rosted.

CHAP. 22. fo they are not to swolne, but they are more compact. The Arabians call them Alcarad. Guardam, Faed, and with an Article, Alguardam, and Alfaed, as Ingraffias observed. Also in the Synonymaes contr. Rhafts, they are cathed Motes and Immores. The Italians call these Piatolos, and Chacillos, and Albenzoar Platulas. All Lice breed from humours, sleth, fat, siveat corrupted, and differ exceedingly in respect of the place and humour. For those that breed of mans bloud will die if you smeare them with the bloud of other Creatures. Also they that breed in a mans head will hardly live, or not long in his body. So the wilde Lice bred in the priviles will die in the head. Those that breed of flesh putrefied, such as often will a Causes of a bound in Ulcers ill cured, will not be fed with the excrements of the skin, (faith Hieron general lowfie Mercurialis, l. 1.c. 7. de morb. cut.) The opinions of Authors are divers concerning the general differences tion of this disease: Aristotle 5. bist. mim. c. 31. thinks that Lice breed of flesh corrupteds in which place he affirms three things. First, that they that breed Lice, have some pulses arising before in their skin, which if a man prick, the Lice will appear. Then that this difease come not, but by moyst humours, or to such that have been troubled with a long and moyst difease. Lastly, that all Birds, Fish, Four-footed beasts, are molested with this disease, except an Affe. The first opinion pleaseth me not: First because in the skin of the head Lice breed most commonly, where there is the least portion of flesh. And again, if they should breed only of corrupt fleshiche heads of young children that are almost allwayes full of them would be so wanting of flesh, that it would almost wast all away. Further, in Consumptions, where the body nourifieth not, and is wholly confirmed almost, they abound most commonly, where all L, de Plant c.s. the flesh is so dry, that there is no moyllure almost to breed Lice. Theophrasius is of another minde from Arifforle, affirming that Lice bread of corrupt purrefied bloud; which Hieron. Mercurialit in the quoted place labours to infringe by these reasons. First because in Feavers that grow from putrefaction of bloud, there is feen no such increase of Lice. Secondly, if they should be made from bloud, some of them at least would be of a red sanguine colour, and tellifie from whence they were bred, as other things doe, but we see no such, therefore, &c. In which place this otherwife very learned man, feems to beg his principle. For in the heads of our children we oftrimes finde very red Lice, and in those that are upon recovery of a putrid Synochus, we finde that oft times many red and mingled coloured Lice breed. Galen, 1. de comp. med. sec. lic. s. 7. and Avicema l. 4. sen. 7. tratt. 5. c. 26, alcribe them to some other caus, and as Mercurialis thinks, that their opinion is the truest of all, namely, that they breed from the hot excrements of the second and third concoction putrefied, nor sharp, nor bad. To understand rightly their opinion, we must know, that when bloud is changed into the substance of the Limbs, many kindes of excrements are produced, whereof some are dissolved by insensible transpiration, others by sweat, others turn to filth, others stay in the skin: Those that are retained in the upper skin, make dandruf, if they stay in the depth of the skin, or are bad and sharp, they cause fore heads. But since I have observed that in some that were in a Consumption uncurable, where the sharpnesse of the humour eats up the very roots of the hairs, Lice come forth abundantly, why may I not think by their leave that they may breed at first from sharp humours? Scaliger would prove that Lice breed not from putrid humours, because herbs grow from the seed wishout putrefaction; for he thinks the principle is altered, but he beleeves not it can be corrupted. But by his leave I must say that Scaliger of the Apostle must be miltaken : For so St. Paul, i Cor. 15. That which thou somelt is not quickened unleffe it die. But if death be a corruption, as the Philosophers say, then Scaliger was deceived, and (yet keeping the Laws of friendship) we may deservedly reject his opinion. And Epithymum breeds from Thyme, and Misselroe ariseth from some trees, that are found, and not yet corrupted. But I answer, that a Lowse differs more from the principle it proceeds from, than Epithymum doth from Thyme, trees from Misseltoe. For these are of the same kinde, and are as it were thrust form from the abundance of fruitfull matter, and Misseltoe is nourished from the pith of the tree. But it is apparent, that Lice seldome breed in found bodyes, or not at all, but those that are cachectically in Confumptions, and full of putrefaction, and watry bloud, and whole flesh and skin are corrupt as well as their bloud, and fat, are troubled with them. Oft times found men sweat, and yet breed no Lice, for they will not breed of all sweat, but from corrupt five at, and that which is not bitter. But when it grows bitter, (as we finde it in those that are dying, or troubled with the Jaundies) they fortake their stations and creep from the body into the pillowes that are under them; yet they do not alwayes go to other places when men are dead, for as those that take care of the dead Corpses affirm, they will still slick about the mouth of the stomack, and under the chin by the sharp artery; which places which are most full of native heat, when they once creep into, it is no small fign of death approaching. Also the complexion serves much to breed Lice, the Countrey, and the dreffing. For some have more, some fewer, and some in any Climate will be free from them. Oviedns 1. Navig. c. 82. Writes, that Christians in the West-Indies have not so much as a Lowse in their heads, and yet the Inhabitants (to use Plantus his phrase) are very Lowly, pedicofi. Also our Countrey-men have obsetved, that have passed upon the Indian lea, when they have left the Isle of Azores behinde them, all the Lice prefently die, and when they see those Islands again, they will revive abundantly. I think the reason is, (that I may here help Pennius out) the extreme hear between the Tropicks, that not only flicks aliment from them; but the Element alfo. Velpucius testifieth of the Me

CHAP: 22.

1092

of St. Thomas, that the Blackmoors there are tull of Lice, but the white men are free of that tronble. As for dressing the body: all Ireland is noted for this, that it swarms almost with Lice. But that this proceeds from the beaftliness of the people, and want of cleanly women to wash them is manifell because the English that are more careful to dress themselves, changing & washing their thirts often, having inhabited to long in Ireland, have escaped that plague. Hence it is that Armies and Prifons are fo full of Lice, the tweat being corrupted by wearing alwaies the fame cloathes, and from thence atifeth matter for their original by the mediation of hear. So those that keep no diet, but delight in eating and filthines, and feed on Vipers, Radishes, Basil, Figs, Lignum Aloes, Garden Smallage, and Dates too much, their bodies will from putrefaction of humours breed Lice between their skin, as Diodorus in Empiricus, Simon Sethi, Actius, and Pliny affirm. But Dissocrides faith it is exceeding false, that Lice will grow from eating Vipers. Sheeps-wool that a Wolf hath killed will breed Lice, if a garment made thereof be wet with sweat, which grant that it be an invention of Aristotle and Pliny, yet experience teacheth ins, that cloathes smeered with Horses grease, will breed Lice presently. Elian saith that he will be full of Lice, who is anointed with oyl wherein a Stellio is drowned.

Prevention and Cure.

Against this terrible disease, which the Greeks call of neison, many have invented divers remedies. The Irish and Iseland people (who are frequently troubled with Lice, and such as will fly, as they say, in Summer) anoint their shirts with Saffron, and to very good purposes to drive away the Lice, but after fix moneths they wash their shirts again putting fresh Saffron into the Lye, But Antigonus in Synag. Histor. Paradox. fo foon as little pushes or wheels appear upon the body, bids us pilck them, and take forth the Lice: but if they be left unprickt, that general lowing difease will come, whereby they say that Alemaon Physicus, and Pherecides Syrus were destroyed.

The general Cure of the lowfie Difeafe.

Amatus Lusitanus cured that good Venetian at Ancona (of whom I spake before) who was lick of a general lowfie difease. First, by opening a vein, and then purging him; for so he drove torth the corrupt humours that fomented the disease, not at once, but twice or thrice. Afterwards by applying Topical remedies, in a short time he grew free of this plague. Topical Medicaments were made thus: Take bitter Lupins iij. pugils, feeds of Staves-acre ij. pugils, in the tharpest Vinegar what is sufficient, boyl them, and with that Vinegar wash the body from head to feed, then wipe and dry it, and anoint it with this oyntment following: Take Staves-acre two parts, Sandaracha of the Greeks one part, the finest Nitre half a part, mingle them all with the sharpest Vinegar and oyl of Radishes, and pound them together very exactly, and with these make an oyntment: with which Amatus foon attained his purpose that the fick fell no more into the same foul discase. Amat. Lusitan.cent 3. curat. 58. Herod (as Tofephus and Agesippus testifie) when he had got this difease by his great pride, and he was so smitten from God, he went to the Baths beyond Jordan, and the Bituminous Lake, that were very good to cure this disease, but at that time they were of no force, when God was pleased to punish a proud Prince with a contemptible creature. If the body be lowfie all over, it shewes a general Cacochymia, wherefore it is best in my opinion, first to open a vein, and then to give a Purge, as the humour requires, and so to proceed to specificals, and such as agree with the place affected. Dioscorides prescribes such kindes of internal remedies: Take Garlick with the decoction of Origanum; drink this three daies. Another, Let the fick drink Coriander bruifed with Origanum, and anoint himself outwardly with Honey. He commends also Alum-water, and the Decoction of Betes, juice of Ivy and the gum of it with Honey, liquid Pitch, Alum, Synopex smeered on with Vinegar, Nitre with Samian Earth and Oyl,

Other outward Remedies that kill Lice, out of Pliny: Seeds of Staves-acre beaten, without the hulls, will free the body from Lice, but better if you mingle them with the Sandaracha of the Greeks, Multard-feed, Garlick, with Vinegar and Nitre are good for the fame. Oyl of Radish doth cure the lowfie disease contracted for a long time. Siler, Mountain-seed beaten with Oyl, Hysop, mingled with Oyl, Tar, sweet Gums, the juice of the wilde Vine, and Staves-acre boyl'd in Vinegar, will free garments from them. So black Hellebore with Oyl or Milk anointed on is very good. Internal Remedies out of Pliny. A Snakes cast skin powdred and drank for three daies, will keep the body free from Lice. Mustard-seed, or seed of Tamarisk, drank, are good; to is water of Radish-leaves, and the juyce of Privet-berries, Plantain, Garlick, the juyce of wilde Cucumer, and Tar. Nonus commends the root of the sharp Dock, bruised with Oyl and anointed, first washing the body with the decoction of Lupins, and he prescribes a remedy of Sandaracha of the Greeks, Nitre, and Staves-acre. Oribalius approves the juyce of Pellitory long subbed on, or Nitre with the wilde Vine in a Bath. Rhasis prefers the leaves of Barberies, gum of Ivie, great Knot-grass, and Sea-water. Avicenna commends Quicksilver with oyl of Roies, and wilde Staves-acre with Arsenick. Haly Abbas bids us purge the body, and then to eat meat of good juyce, to wish away the filth, and to change our clothes often: then he prescribes Quickfilver bruised with Staves-acre-seed, and oyl of wilde Saffron, and with that to anoint the body morning and evening, after bathing. He farther commands us to me these Remedies: Take long Birthwort, bruile it with Pine-leaves and Quickfilver, and with oyl of Lupins what may serve turn, make an Unguent. Anoint the body with that at night, and in the moining wash it with hot water, after that, with a decoction of Alum, Wormwood, Santonicum, or Muewo.t. rubit away. Another: Take round and long Birthwort, red Arfenick, that is the Greeks Sandaracha; and with oyl of Ben. make an unguent, with this anoint the body in the evening, and in the moining rub the body with Bran and Barley-meal. Another: Take biter Collus, Cardamomun, Buls gall, bray them with the Oyl of Pinaches, anoint the body with it, and in the moining wash it with the water of a decoction of clear Bran, or of Barley. Constantinu used Orickhlyer with afhes, Litharge, Vinegar and Oyl mingled together for hor complexions: but for cold he used Pine-tree juyce, Sea-water, Staves-acre, Nitre, Arsenick, and oyl of wilde Saffron. Johannes de Rupe scissa, mingled Quickilver with Aqua vita, and the powder of wilde Scaves-acre. with that he provides a girdle, which worn about the bare loyns will kill the Lice. Serens. Abinzoar, Amatus Lusitanus, Matthiolus, Hildegardis, Johan. Vigo, and others, prescribe other remedies, but most of them of these materials. He that desires more remedies against the lowie difente, let him read Paulus Agineta, 1. 3. c. 3. Galen 1. 1. de comp. med. sec. loc. and Guiliel. de Saliceto 1.1. c. 48. Iknew one (faith Pennius) who when he was Governour of an Hospital, he cured the lowfie diseasethus: He whipt the fick till the skin came off with Birchin rods, and where the plints were, the Lice would never breed again: A new kinde of cure, and most fit for idle Sea-men and flothful companions. Amatus Lusteanus (if I do not mistake) tels of a poor man that had a hole in his back by reason of an Ulcer, out of which daily abundance of Lice creps: queltionless they were bred between the skin and the flesh, and afterwards by an unguent of wilde Staves-acre, Quickilver, Pepper, and Lard, he was cured. Raland prefers the Batiam of Sulphur to all remedies, and not without cause.

Actius writes, that wilde Lice must first be picked out with great diligence, then the place must be formented with warm Sea-water; yet very warily if they flick in the eye-browes, that you hurt not your eyes : then apply this remedy : Take Alum Scissili, drams, Staves-acre J. obolus, Pepper J. obolus, burnt Brais J. dram, Myrrhe ij. oboli, Scissi-stone ij. oboli and half, Mity torrefied), dram; bruise it and dry it, and so use it: Then let them bathe and heat their head with diffcurients and ffrengthners, wash the whole body, and rub it again. Our Countreymen pick them out, and then they anoint the places well with black Sope, and if the body were too hot, anoint the body with the pap of a sweet apple mingled with Quickfilver, and it is a certain remedy. Celfus faith they offend the eye-brows so much sometimes, that the eyes being ulcerated they dim the fight, then incorporate purified Quickfilver with tops of Wormwood, and old Hogs greafe, for nothing doth more certainly cure one, if it be done with caution. Alfotake Aloes J. ounce, Ceruse, Frankincense, each v. ounces, Lardwhat may suffice, make an unguent; fome mingle with this Quickfilver and Brimflone. But here observe, if Crab-lice do breed thick on the beard, eye-brows, the share, and peritoneum; first all the hairs must be shaved off, so foon as a general purgation hath been taken, and then the forementioned Topicks must be applyed, and all galls, especially Bulsgall, Calfs gall, Capons and Partridge, with juyce of Centaury and Quickfilver, are held very good. A lye of the ashes of Tamarisk destroyes the Lice. Rhasis and Albertus commend the marrow of a live Vulture taken forth. Varignana useth the milk of the greater Bindweed, wilde Mints, and Sow-bread, with a lotion of Honey. But chiefly he extols this Medicament: Take Staves-acre it. ounces, Wine iv. glasses, Hogs briftles it. ounces, purged Quicksilver i. ounce, let them boyl, and foment the body with the decociton. Marinellus and many others make great reckoning of Wine-lees, juyce of Broom, a Lixivium of Sena, Acorns, Cassia, Pellitory of Spain. But Gilbert an Englishman burns Leeches

These filthy creatures, and that are hated more than Dogs or Vipers, by our daintiest dames, the of Lies, are a joy to those that are fick, and sometimes a cure. For they that have lain long fick of a putrid disease, when Lice breed in their heads, they foreshew the recovery of the sick. For it is a sign of the exhaling of it, and flying forth from the centre to the circumference, Also experience proves that the Jaundies are cured with twelve bruised Lice drank with Wine. Ponnins gave Lice and Butter to beggers and fuch as live on alms, very often, and so he recovered some that were almost desperate; some for the Dysurie are wont to put into the yard living Lice the greatell they can, to draw forth the urine by their tickling : which Alexander Benedictus relates of Wig-lice, when clammy hamours have hurt the eyes, some cleanse them with Lice put into them, which creeping here and there like Oculus Christis, collect the matter; and wrapt up in that they will fall out. Also what shall I say? Apes, Baboons, will feed on them. And Herodorus and Strabo in Pontus speaks of men that feed on Lice, (to whom Arianus in Periplo consents) and the Spaniards speake the same of the Inhabitants of the Province of Cuenensis in the West-Indies. And they hunt after them so greedily and desire them, that the Spaniards can hardly keep their slaves from feeding on them. And it is no wonder that they can feed on Lice, that devour Horses, Asses, Cats, Worms (and more than that) men that are raw. But because it is an idle work, the women have that task put upon them to catch Lice, and they do that work almost, and therefore Serabo cals them Pedilegas. Serenus makes another use of them, and writes thus ?

and Styrax Calamita together, and with these and Hogs bloud, he preparss an excellent Und

CHAP. XXIII.

Of the Lice of brute Beasts and Plants.

This plague fell not only on Man for his first transgression, but upon beasts also: yet amongs mankinde children are more full of them than young people, men than women, fick people than found, nally people than fuch as are cleanly; and so it is with other creatures: only the Asse is said to be free from this disease, not because Christ rid upon him, (as some sools dream) but because he goes so softly that he seldom sweats, or else God hath bestowed upon him some peculiar antipathy. The Lion is a couragious creature and king of beafts, yet is he so tormented with Lice feeding on his eye-browes, that when he cannot help himself with scratching with his clawes, he will sometimes grow surious, as Pliny reports. Who hath not seen the Lice of a Horse, that most generous sour-sooted creature, and Nits with red heads that are apparent, and the rest of their body is of a dark white? The Lice of Oxen and Calves are black, and those that are lean have very many, like to Hog-lice almost, but shorter and somewhat thickor. Hog-lice have the same form, but they are so great and hard that you can hardly kill them with your fingers, these are called *Uris* from burnings as Albertus testifieth 1.4.c. 205. Dogs though more seldom, yet are sometimes Lowsie; but their Lice are small ones, speckled, and with a whitish head, the rest of their body is of a blackish or wan colour from blew, as I first observed by the Dogs at Malta. Sheeps Lice are very small, their heads are red, their bodies white. Goats Lice differ but little from these; when the stag hath strove to cast his horns, he is troubled with an exceeding itching of his eye-lids, from Lice that breed of the same colour with their head that thrus forth: who doth not know by Gesners History of Birds, or by his own exertience, that Swans, Hens, Geese, Pigeons, Quails, Pheasants, Partridge, Hawks, and other fowl have Lice? Also Palladius, Columbila, Paxanus, Varro, and other principal Leeches for cattel, have shewed us remedies sufficient for to kill Lice in brute beasts, that it will be no glory for me to infift upon them, nor fruitful to the Reader: what Avicenna 1. 4. fen. 6. traff. 5. meant by Vultures Lice, I cannot conjecture, and I much defire the help of some Oedipus to untie this ridgle for me : we mentioned before in our first Book, that your dung-Beetles are killed by their own Lice. Also Salmon-fishes, especially the leaner fort, were seen by Pliny to have many Lice under their gils off-times. Also they are found in Plants, as Southernwood, Wormwood, flowers of Water-lillies, and thiefly in Columbine leaves, in June, by reason of its exceeding sweetness, (faith Gefner). Also some plants are called lowse plants, either because they are good against them, as Staves-acre, or because they breed Lice, as Dodonaus his Fistularia, or because they abound with Lice, as Columbines, or from the great despicableness of them, as the fruit of the great plum-tree, which are therefore called lowfie plums.

CHAP. XXIV.

Of little Lice called Syrones, Acati, and Tineze, or Hand-worms, or Mites in living Creatures.

It duaei he. 5. Hist. Animal. c. 2. Also they seem to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones, and It will be seen to be called Syrones. because they creep under the skin continually. It is the smallest living creature that is which useth to breed in old cheefe and wax, and also in mans skip. Pollux and Suidas say that were is such a small thing as is too small to be divided. In Laring they, are called Pedicelli; in French, Ciross; in Demont, sciri; in Calcony, Briganter in English, Mitter, in cheefe, leaves, dry wood, and wax: but in men they are called wheel-worths; the Germans call them Searen. Minzour faith that Syrones are called Afforder, and Afford, they are little Lice creeping between the skin of the hands, thighest and deer, and railing watery blitters there, they are formal creatures, that a coord are a called Afforder, and railing watery blitters there, they are formal creatures, that a coord are a conducted by the control of the contr creatures, that a good eye can hardly discern them. Gabucinus saith; Unto our times a kinde of filthy torture that is not to be endured, is continued, a very small Lowse, not so great as a Nit, creeps under the skin. And Johan. Phil. Ingrassias out of Abenzoar, describes them very handfomely

fornely thus: when the skin is excoriate when that small little pimple and push appears like to a red angry wheal, little living creatures creep forth to intall a man can hardly see them. And Toubertus writes that Syrones are those that are the smallest Lice of all, alwaies lying under the ourward skin, and creep under it as Moles do, biting it, and causing a fierce itching. They consist of a dryer matter than Morpiones, which for want of glutinous matter, is almost divided into Atoms. They breed often in the head, and eat the roots of the hair. The Greeks call them 1226 otres, 722 Contras, on the resembles forme call them Tineas by a peculiar name. Syrones have no certain form as Scaliger well observed, only they are round: our eye can scarsely discern them, they are so small, that Epicurus said it was not made of Atoms, but was an Atom it self. It dwels so under the skin, that when it makes its mines it will cause a grear itching, especially in the hands and other parts affected with them, and held to the fire. If you pull it out with a needle, and lay it on our nail, you shall see it move in the Sun that helps its motion; crack it with the other nail, and it will crack with a noise, and a warry venome comes forth; it is of a white colour, except the head; if you look nearer it is blackish, or from black it is something reddish. It is wonder how so small a creature, that creeps with no feet as it were, can make such long surrowes under the skin. This we must observe by the way, that these Syrones do not dwell in the pimples themselves, but hard by. For it is their property not to remove far from the watty humour, collected in the little bladder or pimple; and when that is wasted or dryed up, they all die shootly after: whence we collect that as they breed from putrefied whey, so again they are fultained by it. None of the Ancients, except Abinzoar writes of these, who saw this disease, and rightly fet down the remedy. Nor are those Syrones of the kinde of Lice, as Johan. Laneiu seems to affert out of Aristotle; for they live without the skin, but these not, nor do I know that

Aristatle in any of his writings, placed Acares amongst Lice. How cruel a disease this is, and to be compared with the lowse disease, an honourable English Lady of fixty years knowes, she was the most vertuous Lady of Penruddock a Knight, that by drinking too much Goats-milk (for she feared a consumption) was for ten years troubled with these wheal-worms, with which night and day she was miterably tortured in her eyes, lips, gums, foles of her feet, head, nose, and all her parts, that she lived a very grievous life, alwaies without rest, and at last in despite of all remedies, the disease increased, whereby her sless was confumed, and the died thereof. I must not overpass this, that the more the women that sat by her, picked them out with their needles, the more their young ones bred, and when they had gnawed the flesh also, they grew to be bigger. Hence let proud despicable mankinde learn, that they are not only worms but worms-meat; and let us fear the power of that great God, who can with so contemptible an army confound, all pride, haughtiness, daintiness, and beauty, and conquer the greatest enemy. It may be some will think it impossible for these Wheal-worms to breed between the eyes; but we see it is so, and we finde it was done so formerly, by an Epistle of D. Le Ieune, a Chirurgeon to Jacob Guillimans, his words are these: Know, saith he, that in the conjunctive membrane, or white of the eye as they commonly call it, some great Wheal-lice by creeping up and down here and there, biting, will make the place itch fo much, that a man cannot hold from rubbing. I in this case used remedies the Ancients used against the Lowie disease, but to no purpose. Then my friends sent me to a sick woman, who with a silver needle pickt out these worms so cunningly and without all pain, that I wondred at it. And indeed had not I seen these little creatures to creep, with my own eyes, I could never have believed that Wheal-worms could breed there. They dye for want of moysture that is falt, and are killed with contrary remedies. The common people ordinarily picks them out with a small needle, (the Germans call them Seuren Graben) but since this takes not away the cause of them, which fosters them, the disease till abides: wherefore it is best to kill them with an unguent or fomentation, which may at once take off that troublesome itching. That which penetrates most and kils these Syrones is falt and vinegar. Laur. Joubert. Joh. Arden, formerly the most learned Chiruregeon of England, faith that a Lotion with Sublimate kils them quite. And it seems not to be against reason: for it dries, penetrates, resists purresaction, and by its heating acrimony kils them all. Abinzoar 1.2. c. 19. trast. 7. prescribes these following remedies. First purge the body with an infusion of wilde Saffron-seed, and Nettle-seed, after that anoint it outwardly with the oyl of bitter Almonds, or de Cherva, and with the juice of the leaves of Peach-tree: give boyled Partridge for meat, and leavened bread. Let the patient abitain from all kinde of fruit (except almonds) especially from Figs, Grapes, Jujubes, and Apples; rub the body often with the substance or pulp of Melons, or with the Mucilage of the feed. But if the body be fleshy, rub it with the juyce of the leaves of the Peach-tree. Pliny, where there is this disease, forbids Oxe-flesh, Hogs, Geese, and all kindes of Pulse.

Erotis 1. de pas. mul. writes thus: Wheat tempered with Wine, adding thereto powder of Frankincense, put to the parts affected for a plainter, will kill these wheal-worms every where, thiefly upon the cheeks and to cheads. Another: Take common Salt, black Soap, live Brimflone, each alike, incorporate them with yinegar of Squils, and anoint the place with them. Another for Syrones on the face, which the Author of the English Rose cals Barrones: Take tharp Dock, Frankincense, Dragons cuttle-bone, each alike, make a powder, and thrice in a week rub the places where the Worms breed, but first wash you face with a decoction of Bran, and on. Sunday wash your face with the white of an egg and white Starch, and then wash it often

with river-water, or with white starch. Alexander Petronius Traianus commends this remedy most: namely a fine linnen cloth made into lint; that it may be the foster, and slick the faster. binde this to the part affected, then lay on the white of an egge that is rosted hard, whilest it is hor, and cut into large pieces, and then binde upon it some thicker cloth, and so let it remain some hours. Then taking all away, you shall finde the inward lint full of these small Lice. which is thus proved: Thake this over the fire, and you shall easily hear these young Syrones crack. Against hair-eating Worms and Mites in the heads of children, that are usual, and that will make little holes, in them, Alexim makes great account of this remedy. Take Frankincense, Bores-grease so much as you please, let them boyl in an earthen vessel that is glassed, and make an unguent. Another: Sprinkle on the powder of burnt Allum, and lay on some line. Another not uneffectual: Powder quick Brimstone, with Rose Vinegar of Squils, or else incorporate it with Rose-water, and binde it on with a cloth for 24 hours. Another that is most certain: Take juice of Lemmons and Aqua vitæ, each alike, burnt Salt what may suffice, mingle them, and anoint with them often. Another of Hildegard; Apply that skimming of the air, that is, those cobwebs that are scattered in Autumn, and it will certainly dostroy all those Syrones and little worms. Also frew on the powder of Bees that are dead in their hives, on the places affected and they will all dye, chiefly if it were mixt with Aqua vita, or Vinegar of Squils. Again: binde on the crums of white bread whilest they are hot, do it often, the heat will kill them, Fir-tree feed burnt to affes, which growes on the top of the tree, if it be frewed on, will help much. Also the kernels of Barberries, powdered and laid to the place, will kill Syrones. Johan. Vigo prescribes these remedies against Syrones wheresoever they breed. All bitter things, faith he, are good against them, shave the part affected, that they may penetrate the better. Ovi of Vitriol warily and lightly powred on will kill them mightily. Quickfilver with French Soap and a little Orpiment, and some Vinegar of Squils and some Aloes, doth much good. For Syrons in the Teeth: Some call the Worms that breed in mens teeth Syrones, which they affirm have fallen forth like shavings of Lute-strings by the smoke of Henbane-seed, received at the mouth Though I should truly deny that these shavings are Worms, yet that Worms breed in rotten teeth Barbers and every man knowes. Against venomous Syrones, Abinzoar cals it the disease of Oxen, between the flesh and skin there breeds a kinde of venomous Worms; which raiseth no small tumour, as great as a walnut, wherein the Worm Syro lies hid, (he is venomous indeed, though he be but little). This disease neglected will kill. He appoints the Remedy thus: The place must be presently burnt with an actual cautery, then apply lint with Barly-meal and sweet water: when the pain of the burning is over, the humour will fall being anointed with Unguent of Agrippa and oyl of Roses, then wash the place with water of Honey, and strew on powder of Roses; and then using incarnatives, close up the wound. But if the part cannot be cauterized or cut, take Lupine-meal, Soot, Pepper, root of Endive, each alike, and bruifing them all, and wetting them with Alchitra, fill half a Nut-shel with them, and keep them on so long, till the force of the medicament may penetrate to the Worm: but great care must be had that no part be left bare without the shell. A little creature called Nigua, as Thevet imagineth, doth much vex the West-Indian people. It is faith he an Infect most offensive to mens hands, far less than a Flea, but breeds in the dust as a Flea doth. De Lery was taken with the same oversight, and was not ashamed to be mad with Theres for company. But Oviedus affirms that they breed between the skin and the flesh: but especially they breed under the nails of the fingers, into which place, when once they are rooted, the cause a swelling as great as a pease, with a might y itching, and they multiply like to Nits. Now if this worm be not timely pickt forth with its brood, in a few daies this itching becomes a wonderful pain, and the fick dye with the violence of the disease. There is a Worm that breeds on the bodies of Hawks and Faulcons under the roots of their wings, it is called Trolla: we have left off to doubt any longer whether it be a Syron, Acarus, or Tineasor not, by reading Albertus his Book, wherein you may read a remedy for that difease at large. Also, as Bonaceiolus reports, in the urines of some women with childe, little red Worms called Syrones will be seen, which are a certain argument of conception. Dermestes is an Insect that will confume skins, and from skins it hath its name, and as the skins vary, fo that changeth its colour. For oft-times it followes the colour the skin is of: it is as big as a Flea, with fix feet and a forked nib. Also a Moth consumes clothes, especially woollen clothes; for it is a very devouring creating ture, and breeds from Butterflies as I said.

The Theater of Infects: or,

CHAP. XXV. Of Wall-lice.

THE Greeks callit wes, the Latins, Cimen; the Hebrews, Pischpesca, from seeking; for it seeks after living creatures that are asleep, to suck their bloud. Isidore will have it called where and Cimen, from the herb where, which they call Cimicaria; I confess ingenuously I know not what he bit is, unless it be that low and stinking kinde of wilde Orach, which growing near to wals and heaps of ditt, is called by a bawdy name, Vulvaria. For Coris of Matthislus smels well, and therefore agrees not with Cimicaria. The Arabians and Barbarians call it Alcarad. Debuliar, Felales, Coroda, and Corab: the Germans Wantlaufz; the English, Wall-lows; the Saxons Wantzen, that is Wall-lowfe; the Brabant people call it not amis Wuegluys, or Lowse of bedsleds: the Spaniards call them Chimefas; the Italians Cimice; the French Punaise. Now Wall-lice are either home-bred and without wings, or winged and wilde Lice. We spake of these in the first book, now we shall speak of those that breed in houses.

This home-bred Lowse is a creature naturally disdained, to use the words of Pliny, it is almost like to a Tike, for the body of it is of the figure called Rhomboides, black of colour with a little

red: it hath short feet near the neck, on each side three, and the belly and back marked with incitions; the skin is very thin, that it will break in pieces with the least touch, and send forth a most abominable stink. In the night by biring shatply, it sucks bloud out of mens bodies to sustain it self. For like Moths it cannot endure the light, and when the day breaks it will go into chinks of beds and wals. After it hathbit it leaves behinde purple spots swoln with an irching pain. They are bred, after Aristotles opinion, from moisture that iwears forth on the furface of the bodies of living creatures, lib. 5. c. 31 hiftor. but without doubt they arise from other humours corrupting about beds, and that sweat out of wood by degrees. Also they propagate by copulation, as Penniss observed about Orleance; for whilest he kept company with a Spaniard born at Capera, he strova to draw his sword to cut off a bough: but when he could hardly do it for the ruft, he was forced to cur his scabbard, where he found abundance of great Wall-lice, with a great company of young ones, and a multipude of which eggs, of a water company or young ones, and a multipude of which eggs, of a water complexion. Sealiger faith they will breed in Hebs, and also in a fhort time they will infinitely increase in the Qualis nestes. They are frequent in Hir-tree bedsides, and chiefly when the strawgroves, old. Also they will breed in paper-books. Ludwicus Vives in his Distogues; thinks that wals overtast with Alabaster are the most ready to

breed Worms. It is commonly said (faith fofophus Scaliger), that Wall-lice will breed from Walllice bruited, which is hardly credible. Cardan that was a funcier of subtilties, writes that the Carthussane never vexed with Wall-lice, and he gives the cause, because they ear no flesh. The beds at Tolonfe (I use Scaligers words) reat no flesh, yet they are noted for broading Wall-lige, the hould rather have alledged their cleanliness, and, the frequent washing of their beds and blankets to be the carfe of it, which when the French, the Dutch, and Italians do less regard, they more breed this plague. But the English that take great care to be cleanly and decent are seldom troubled with theme. In the year 1503. When Pennius Writ this, he was called in great hafte to a little village called Moreclack near the Thames, to wift two Noblemen, who were much frighted by perceiving the prints of Wall-lice, and were in doubt of I know not what contagion. But when the matter was known, and the Wall-lice were catched, he laught them out of all fear. Against those enemies of our rest in the night, our merciful God hath sumished us with remedies, that we may fetch out of old and new writers, which being used will either drive them away or kill them. For they are killed with the (moke of Oxe-dung, Horse-hair, Swallows, Scolopendra, Brimdone, Vitriol, Argenick, Verdigreafe, Lignum aloes, Bdellium, Fern, Spatula Fortida, Birthwort, Clematitis, Myrills, Cummin, Lupins, Knorgrafs, Gith, Cyprefs, as we read in. Aetida, Rhafis, Florentinus, Didymus, and Cardan. But the best way is with curtains drawn about the bed, so to shut in the smoke, that it can have no yent. And for this end unguents, oyinments, Embrocations are provided of gall of an Oxe, he Goat, Hedge-hog, Calf, the Goat, Affe, with the leaves of Cucumers and Ivy, Citrons, Ifing-glass, Oyl lees, Oxe dung, and the sharpest Vinegar, quick Brimstone, Squils, Capers, wilde Staves-acre, Wormwood, sweet Wine, Lime, Quickfilver, Bayes, black Soap, winter Cherries, juyce of Oranges, Lemons, &c. whereof confult Varro, Palladius, Arnoldus, Didymus and others: what concerns preventional means, Hemp-feed, or winter Cherries laid near the bed, or hanged up drive away Wall-lice. Democritus faith, that Harts-horn or Hares feet hanging about the bed-posts, will do as much: which another author ascribes to a Foxes ear. The dregs of boyled Butter cast where there are Walllice, will wonderfully kill them, for they will feed on that till they burst. May be this is that fat whereof Cardan speaks in these words: I knew once, saith he, but I have forgot, a fat, that being imeered on a wooden round circle, would so allure all the Wall-lice unto it, like a charm, that one could scarse see the wood for them! Some say that a half-penny laid under the bed will drive away Wig-lice. Some hang by a fleet wet in cold water, and so by actual cold they drive them away. Oyl of it felf or with Vitriol, or Bals gall, or the decoction of black Chamzleon will drive away Wall-lice. Moreoverall things that are exceeding bitter, and have a stronger smell, are doubtless good against Wall-lice. And that strong smels will drive them away, Olau Magnus shewes by many raw hides heapt up together. Alexander Benedittus saith that when these multiply overmuch, they foreshew the plague. For it signifies a corruption of the air, or humours, or both. Bacchus descending to hell, as the Greek Comedian wittily sets it down, desired Impiter to affign him such Innes in his journey, where there were but few Wall-lice : yet faith Pliny, that concord and diftord, which fils all Phylick, by the conduct of nature hath produced nothing that in some part is nor good for man, and therefore that which that Co-Aaaaa 3

CHAP. 27.

median God thought hurtfull, mans posterity hath found beneficiall. Indeed wall-worms are of a corroding quality, yet have they place in Physick; for taken with the bloud of a Tortoise they cure the birings of Serpents. By their still the Epilepsie that ariseth from the strangling of the Mother, is discussed. Inclosed in an Egge or Wax or a Beans and swallowed, are good for an Importume; and a Courtan Ague, and will help them (saith Plm), Dioscrides, Galen, Marcellus, Aetim, Advanius.) Drank with Vinegar or but smelt to, they will remove Horseches that sick too sast. Also the Verses of Jaims Servius show that they are good for Tertian Agues.

Shame not to drink three Wall-lice much with wine,
And Garlick, bruised together at noon-day.

Moreover a bruised Wall-louse with an Egge, repine
Not for to take, the loath sme, yet full good I say.

conner in his writings confirms this experiment, having made trial of it amongh the common and meaner fort of people in the Countrey. The Ancients gave seven to those that were taken with a Lethargy, in a cup of water, and four to children. Pliny and Sevenus consents to it in these Verses.

Boine their preferable seven Wall-lice for to deink,
Mangled with water, and one cup they think.

Is better then with drowly death to sink.

And he of old fang, that bleeding at the note would be stayed with the only smell of Wig. lice. Somethere are, that cure dark sights by reason of a Cataract, bruising these with Sast and Assessment milk. Many anothe painfull cars with honey mingled with Wall-lice, to good purpole. Also Marwille faith they flay vomiting, and he faith it is a certain remedy, if a bruiled Wall-loufe be fwallowed in a rear-egge, by one that is falling, and knowes nothing of it. Pliny feems to prove from thence, that they are good against the stings of all Vipers, Adders, and all kinds of Serpents. because that Hens that feed on these, are free from the stinging of these Creatures. Actin commends Wall-lice against the Strangury, and to drive forth the Stone. Vegetim in this case puts offe Wall-lowfe into the ear! another into the passage of the Yard, and with a gentle friction of the parts, he affirms that they will prefently make water, which remedy he feems to have borrowed out of Hirid in his Hippiatricks. Gulin Eup. 5. reports, that Wall lice will not only provoke trine, but also drank for nine dayes space, will stop childrens water that goes from them against their wills. Valurandus Donures an Islander, a most learned Apothecary of Lyon, often said, that these drank with water hot, or wine, or broth, would wonderfully help those that were troubled with the Stone. Moreover, the later writers wonderfully commend the afhes of them with a fit detoction call in for a Clyster, to bring forth the Stone. If they be bruiled and anounted on the passage of the yard, it will presently provoke urine. Marcellus. There are saich Gesner, that for the Conck prescribe four live Wall-lice to drink in wine, in the morning, and then they command to fall two house after, and they give as many to drink two hours before Supper, and to again the next day untill they have drank up twelve Lice: truly it is a remedy to be despited, but it is no new remedy in that desperate disease, and it is a present cure. It helped Function the Governour of Zuriek at the second taking, and so it did some of his Kindred also, and he was like to have written a commendation in praise of Wall-lice. What concern ouward dilealer. If you pull up the hair by the roots, and anount the part affected with the bloud of Wall-lice, and let it dry, it is the opinion of Galen, Actius, and Nonus, that they will never grow stain. Plin faith that if you anount the breaks with Goofe-greafe and Wall-lice, the pains will abare, the Moles of the matrix will break forth, and scabs of the privities will be oured. Cornenellus Gemma in his Appendix of his Cosmourisien, speaks of a woman in whose Skull opened, were found abundance of Wall-lice.

CHAP. XXVI.

Of Tikes, and Sheeps Lice.

The Tike in Latine Richnus, in Greek neuron, Hessebine calls it aendroed, Suldau neuro, and theirs call it munosements, Sypontinus calls it nunequitaes, but that is not right, for it wants wings. The Arabians call it Alcharad, Alsosafes, Albahem, as Bellunensis reports. The Forlini, saith-Hermolam Barburns, to this very day call Tikes existed, as we read in Dydinus Zedwotes. It is called Richnum in Latine, because it is like the seed of the Plant Palma Christi. Gaza calls it Reduvinm, and Albertus Cometius calls it Tata. Also Albortus Vincentius, Guillerinus de Conchie, call it Engulam. I think that at first it was called Cica, saith Scaliger, because Cici is the same with Croton. The Indians call it Zeva, the Germans Halindack, the French Plata from its compact body, the English Wood-teek. Some distinguish between Richnus and Reduvius, thus very exactly.

Ricinus is a small Infect, that when Summer comes on breeds in pastures among graffe, and in Woods amongst the leaves, of some putrid humour; with a very compact body and that feels plain, with a skin very sough, of a Diamond figured body, of a black shining colour, or a dark brown; but so soon as it talkeneth to any living Creature, and thrusting its head within the skin, it drawes the bloud, in a thort time it growes great and swells, and at length becomes almost round. It bath fin feet fastened to its neck, with a sharp nose, but short, it produceth no young ones, nor is it produced by other living Creatures, and in this it differs from all other lafects, that it is filled with food abundantly, and yet there is no passage for any excrement, and therefore it may be the Hermitans calkis Come. Let therefore the material! Philoforhers that with Aphrodifeus drawall things from the manifest qualities of the Blements, confider diligently, to what default of matter or confusion they will be here forced to fly. It they imagine, that Nature wanted a bodkin to pierce a hole in the tail, they deserve to be hissed at. But rather let them here see and acknowledge that of Paraceting, That bodies may be made from Spirits, and Spirits from bodies. Pliny calls a Tike a fifthy Creature, the end of whose gluttony is, as to gluttons amongst men, death it felf. For in a few dayes it will break with over-fullnesse; yet it will fast lustily for seven dayes. It was to station, who supposed Tikes will breed in a mans beard and groins, for being there fastened it will stick close to feed it self: yet Enflathim and Hofishim are of his fide in thate words. It in ralled a Tike, because it flicke faft to what it is brediin. But she/truth is, a Tike is not bred in living Creatures, but from the corrupt matter of leaves and graffe as I faith before, and as Arifold affirms, Hift. 5. c. 19. Tites breed of Plants. May be Scaliger meant by a Tike some Lowse like a Crab, or some Crab-lowse in man; for they both breed in the beard and privities, and can very hardly be pulled off. It cruelly plagues men and Oxen but efpecially barking Dogs, Gato also testifieth that Sheep and Goats are troubled with Tikes, but he was deceived by the likenesse of their bodies; for that Lowfe of Sheep should be called Redwins our Country-men say (a Sheeps Lowse) hetween which and a Tike there are many and different marks : For a Sheeps Lowle bath a long little beck, and its body when it is fulled is severe to differed but being preffed, it will never feen round. Also the feet of this are of a dark red, the back Aft-coloured.

marked with three black spots, and ie, is framed after the fathion of a heart. The head is not alwayes but seldome fast in the skin, and it drawes bloud forth but by turns, and it vesses, the steed the secrements that breed of it by the tail, and it will dy Wooll of so deep a green, that this cold tincture shall kearen be bettered in a hot dying fat. Sheeps Lice will live a whole year in shorn Woolls but Tikes live only upon the hot bloud of the Creature. Let therefore Cate maintain them both to be of one kinde, yet truth will maintain a vast difference between them. Schools a like to the iwellings of keprous people, saith albertus. Schools whether he mander stand by that a Tike or a Breezs I rather think he meant a Tike, both from the round strem both to she is like to the iwellings of keprous chink he meant a Tike, both from the round strem both the swellings, and from their wan colours. Sate frees shorn sheep from Lice with Oyl less well putrefied, and the best less of strong wine, and a decoction of Lupins added to them, and an anyming them with it, then let them dry two or three dayes, and after that wash them with Sea-water. The English Shepheat's sneet them, and then anoyat them with Tarre and sheeps such; or offe they bruile the root of Acoras, and boy it in water, and they shound them who heads with the warm decoction. Some use nothing but Tarre, others out the special six budies with the warm decoction. Some use nothing but Tarre, others out the special six budies with the warm decoction. Some use not thing but Tarre, others out the special six budies with the warm decoction. Some use nothing but Tarre, others out the special six budies with the warm decoction. Against Dogs Lice the Ancients bid us to anoynt their care which Oyl of bitter Almonds and of Walnuts; experi-

ence confirms that remedy. Also Nemesianus tostifieth as much.

The good to noput their ears, and fet them in the Sun, Or use a red bot knife, when Lace are first begun.

Rbsfis commends against Aschardes of Dogs or Dog-lice, to wash them with Wine, and Vinelgar, Commin-feed and Sale-water. Theomessia and Case prepare oyl of bitter nuts, and with that they anoyou their claws and ears, and secrets also. Tarre of Cedar kills them. Diosottles. But Columbia forbids to pull off Tikes from Oraniand Dogs, hell the places should exulcerate, and he highly commends Tarre and Hogs grease. Phin saich the juice of both Chamzeleons will defirely them. Albertus reports that Tikes bloud will cleanse Wicers, and if they be sinused in wine The Use, will prefently make one drunk. Seranus fatther commends them for to care a Fishula in Ano.

If that now ulcers in the feenets chance to breed, Chew'd Branthe-leaves apply, you quickly shall be freed. Or if from an old fore a liftula do grow, Alfredis after burns will help's; and further know, The bland of an On Tike is no means elfe bolom.

CHAP. 28.

Also the bloud of a Tike will cure the Shingles. Also men' fay, that a Tike pulled out of the left ear of a Dog, if it be tied on, it will cure all pains. Pliny writ this out of Nigidim. Also he afferts that if a womans loyns be anounted with the bloud of it, she will abhorre venery. Moreover nine or ten Goats Tikes taken in wine, will stop the terms. Dioscorides. Anoynt vour eve-lids with the bloud of a Tike taken from a Bitch, the hairs being first pluckt off, saith Galen. Simpl. 10. c. 5. and they will never grow again: So also Pliny and Avicenna write, but it is from other mens opinions. Dionysiu Melesiu prescribes such a Depilotary against pricking thorny hairs: Burn a Sea-hare in a new earthen pot, and keep the after with Tikes bloud in a horn box, use this, first pulling out the hairs. Many English men have learned by experience, that one dram and a half of Sheeps Lice given in drink will ioon and certainly cure the Jaundies.

CHAP. XXVII. Of the Garment-eating Moth.

DEnnius beginning to write the history of this Infect, faith that Tines is a word that fignifies many things; as Lice of Hawk-weed according to Albertus, Wood-lice in Plantus, the plague of Bee-hives in Figil, and it fignifies the creeping ulcers of the head, that are eaten like to garments, whence it may be Glaudian writes at the electronic state and are esten like to ments, whence it may be Glaudian writes at the state of the st

Gond translates where Tineas, but very ignorantly, as we observed in the history of Catterpillars. Also Piny faith that Tines do destroy the seeds of Figs, he means the Worms that breed in Figs, from whence grow Three. Niphus cals that little Scorpion which eats books Tineus, whereof I spake in the history of Scorpions. But Elle and manie, if a man will speak properly, is a Worm that eats garments. It is called in Latine Tinea, a tenendo from holding, for it flicks falt in garments, and will not easily change its station. The Fremb call it Teigne, the Spaniards Tind the Italians Tignola, the Muscovites Mel, the Polonians Mel, the English Moth, the Hebrewes Hingleh, and Sas, as you shall finde it Job chap. 13. and Isi. 51. It is a little Worm of a wan white colour, of which arifeth that small kinde of Plie that will fly at night about the Candle-light. There are fome of them that are filver-coloured, the English call them filver-moths, the Dutch Schietes, from their swift motion. Niphus greatly erred; making this the Scorpion among Books. There is also a certain Worm that is thick, or with a coat, faith Pliny, called Tinea, that drawes its coat along with it, as a Snail doth its shell, and when she is deprived of this she presently dieth. But if this coat grow too great, it changeth to a Chryfalie, out of which at a fet time a little Glow-worm comes. This kinde hanging by a thred, hangs a long time in houses before it changeth to an Au-relia. It hath a little black head; the rest of the body is a whitish dark brown, the Case of it is fomething long, made almost of a Cobweb, not round at all, but lightly compacted, and at each end fomething hairy. The Phalene that come from thence flick by the feet to the roofs of houses, un-till their bodies being corrupted and putrefied they are bred again when their bodies corrupt, and their wings and feet fall off of themselves, they hang with a thred by the tails. At length they get a Cafe and are turned into this kinde of Moth. In Germany and Helvetia there is a Moth of a fad red colour, with a little thick head, the body grows by degrees smaller even to the tail. The colour of its belly is lighter, fomething yellow, and like a fort downy filk. It is a very tender Creature, especially that which is filver'd over, and it is bruised to pieces if you do but touch it. Whence that Kingly Plalmift, Plal. 39. When thou with chaftifements shalt correct man, thou makest him to conjume away as a Moth. And Job, Chap. 40. he amplifying the certain destruction of the wicked: They shall be bruised (saith he) before the Moth. All Moths are reckoned amongst the number of sixfooted Creatures, and they breed in Garments as well of Wooll, as skins that are not cleanled from dust and fith: and so much the sooner if a Spider be shut in, as Aristotle writes. For the Spider drinks up all their inbred moysture, and dries them; wherefore care must be had that garments be not layd up full of duft, and when the Air is thick and moyft. Some to avoid Moths, ventilate their garments in the hot Sun-shine : which our women severely forbid, and lay them up in the shade, and when the winde is high and very cold. For they hold that the Sun-beams are kindly for Moths, but windes and tempelts and the shade are enemies to them. These Worms when they have by degrees infensibly eat off the outmost superficies of the cloth, then they eat up the inward part, and so infinuate themselves into the middle substance of it, that those that search never so well for them can hardly finde them. The Ancients were most expert to kill Moths. For the garments of Servine Tulius lasted to the destruction of Sejanus, for they were kept with so great diligence by the keepers of the Wardrobe, that they neither confumed by age, nor were Moth-eaten. They that fell woollen Clothes, use to wrap up the skin of a Bird called the Kingso Fifter amongst them, or else hang one in the shop, as a thing by a secret Antipathy that Moths cannot endure. They are handsomely destroyed by the sent and smoke of Savin, Hops, Fingerhood, Wormwood, Rosemary, Poley, Panax, Aniseed, Golden-flower, Pomegranates, Citron-

pills, (for this was the chiefest use of Citrons in old time) the out-landish Myrtle, Cedar, Cypresse, Calamint, Brimstone, Downy feathers. The Books that were found in Nama his Tomb, were faid to be anounted with the juice of Cedar: wherefore as Pliny writes, they were supposed to be free from Moths above 530. years. The bones of Bergefterts (I know not what beaft it is) being brought to powder, and ftrew'd amongst garments, will drive away Moths, if we will credit Hildeoard: Rhasts reports that Cantharides hung up in the middle of the house will do as much: Who faith moreover that garments wrapt up in a Lions skin, will never have any Moths. Some wet a a linnen cloth in a strong lie, and dry it in the Sun without pressing it, and they affirm, that clothes wrapt in that will not be Moth-eaten. Cato bids sprinkle your Wardrobe with Oyl-lees. That which Pliny reports is a wonder, that a Cloth laid under the Biere of a dead body, will never have Moths to hurt it. The richer people, who (as Horace writes)

Whole hangings rot in Chefts, rich for the Worms and Moths,

take diligent care in Summer to look up their garments, and taking them out of their Coffers, they air them in open place for the winde, and then they beat off the dust with the leaves of Indian Millet, or Hogs briftles, or Broom Mosse, or with Worm-wood branches. Of old they were wont to do it with an Ox tail; for fo Martial writes;

> If that with yellow dust thy costly clothes abound, Thou maylt with an Oz tail brufb't off upon the ground.

There are also rich Merchants, that have Cedar and Cypresse Chests, and they put up powder of Origanum, Worm-wood, Orris, Citron-pills, Myrtle-berries with their clothes, and by such remedies they drive far from them this Wooll-devouring Creature.

We writ before amongst the fix-footed Worms, of Worms in books, wood, the skin, the fruit devourers. I have nothing more to add to this Chapter, but only to exhort rich men to lay up their treafure there, where neither Moths shall eat their garments, nor rust confume their Silver ; and let them in the mean time leave off that infinite expense in clothes, of which can they look for any better of the Lyrick Poet,

Than to feed black Bugs, and the Lazy Moth: ? end, to use the words of the Lyrick Poet,

If a man, faith Calvin, born of a woman, having but a floor time to live, and alwayes waxing old, and corrupting, would think himself to be like a garment that Moths ear, certainly he would lay aside all pride, and blush, and fall lowly upon his knees unto Almighty God. 1ad Jones

CHAP. XXVIII. He Latin word Pulen, in Greek dona or Alina; comes faith Islane, from Puloti; dust, or the fon of dust, in Spanish Pulga, Italian Pulice, Brench Puce, English Flea, the Germans from its nimblenesse in flight call its Florb. Pleas are not the least plague, especially when in greater numbers they molest men that are sleeping, and they trouble wearled and sick persons; they escape by skipping from us; and so soon as day breaks they forfake the bed. They are a vexation to all men, but especially, as the wanton Post hath it, to young maids, whose mimble fingers and that are as it were clammy with moutture, they can fearce avoyd. These Fleas are either common or extraordinary. The common ones are final Creatures about the bigneffe of Lice, but their bodies are fofter, and they are bunch-backt, almost like a Hog, they are black and thining, their breaft and belly is yellow from black, in white Dogs they are more clear, in red more yellow. in black Dogs blacker than in others. Here I defire you to observe the wonder of Nature, that their hinder little lege are bent backwards toward their bellies; and their forelegs toward their breafts, as four-footed beafts are, as it is ufual almost in all Infects to whom Nature hath given but four feet. It may be for that end the joynts of Fleas are so disposed, that they may with the more ease hide themselves in the long foldings and plights of the blankers from those that hunt after them. The ends of their feet are divided into two parts, and are hooked and sharp, and seem as it were to be horny, not only share they may more furely creep up upon high places, but also that they may fit and flick fafter to the imooth skin : They have a fittle head, and a mouth not forked but firong and brawny, with a very thort neck, to which one Mark an Englishman (most skilfull in all curious work) fastned a Chain of Gold as long as a mans finger, with a lock and key fo rarely and cunningly, that the Flea could easily go and draw them, yet the Flea, the Chain, lock and key were not all above a grain weight : I have also heard from men of credit, that this Flea so tied with a Chain, did draw a Coach of Gold that was every way perfect, and that very lightly; which much fets forth the Artists skill, and the Fleas strength. The point of his nib is something

CHAIP. 29.

hard, that he may make it enter the better. It must necessarily be hollow, that he may suck out the bloud, and carry it in. They feek for the most tender places, and will not attempt the harder places with their nibble; with two very small foreyards that spring out of their foreheads, they both prove their way, and judge of the nature of the object, and whether it be hard or foft: where they be they leave a red spot as a Trophie of their force, which they set up. In rainy weather they bite forely, and are bold to run over ever part of mans body. They have but one small intestine with folds inward, which is either relaxed or contracted as they eat more or lesse. The leffer, the leaner, and the younger they are, the sharper they bite, the fat ones play and tickle men more willingly. It is very probable that they have eyes, both because they choose their places of retreat, and because they withdraw themselves when the day breaks. They will not fir upon corrupt or dead flesh. Those that have the Kings evil, because they are of bitter juice, and fuch as will die, because of the corruption and stink of the same, they will not meddle with. At all times they trouble men and Dogs, but chiefly in the night. Though they trouble us much, yet they neither stink as Wall-lice doe, nor is it any difgrace to a man to be troubled with them, as it is to be lowfie. They only punish fluggish people, for they will remove farre from cleanly house fee; when they finde they are arraigned to die, and they feel the finger coming, on a fudden they are gone, and leap here and there, and so escape the danger : whilest those that hunt them endeavour to measure their jumps, as Aristophanes saith, they but play the fools. In the morning after they have fed, they creep into the rough blankets, and flick to the walls, or elfe they hide themselves in the rushes or dust: and so they ly in ambush for Pigeons, Hens, and other Birds, alfo for men and Dogs, Moles, Mice, and vex fuch as passe by. Our hunters report, that Foxes are full of them, and they tell a pretty flory how they quit themselves of them. The Fox gathers fome handfulls of wooll from thorns and briars, and wrapping it up, he holds it fast in his mouth, then he goes by degrees into a cold River, and dipping himselt in by little and little, when he finds that all the fleas are crept to high as his head for fear of drowning, and to for shelter crept into the wooll, he barks and spits out the wooll full of Fleas, and so very froliquely being delivered from their molestation, he swims to land.

Their first Originall is from dust; chiefly that which is moustned with mans or Goats urine. Also they breed amongst Dogs hair, from a fat humour putrefied, as Scaliger affirms. A little corruption will breed them, and the place of their original is dry filth. Martyr the Author of the Decads of Navigation, writes, that in Perienna a Countrey of the Indies, the drops of sweat that fall from their slaves bodies will presently turn to fleas. Some Countreys are such enemies to Fleas, that if they be brought in thither they cannot live, nor will they breed there; as in the Territory Tefetbor of Sigelunum. Contrarily the City Hea by the fea-fide, (unlesse John Leo deceives us) is most fruitfull for Fleas, by reason of the abundance of Goats, as also Dede. In Hispaniola Fleas are found, but neither many, nor great ones; but they bite more fiercely by farre than ours doe : they love hot places, where the Sun shines. In the Spring they multiply, at the beginning of Winter they die, for they cannot endure the cold. They copulate, the male afcending upon the female as Flies doe, and they both goe, leap, and rest together. They stick long together, and are hardly pulled afunder. After copulation prefently almost the female full of Egges feems fatter: which though in her belly they feem long, very fmall, very many, and white, yet when they are layd, they turn presently black, and turn into littles Fleas, if we may grant what Pennius saith, that bite most cruelly. Philoponus in lib. de generat, maintains that Fleas breed not Egges but Nits, and Niphus faith the same: But they endeavouring to prove this because they crack when they are crushed doth not confirm their opinion, for Egges will not break under the nail without cracking. Arifotle thinks, that from them, be they Egges, Nits, or little Worms, no other Creature breeds, and I should willingly subscribe to him, but that I think Nature made nothing in vain. Those Fleas feem to be more rare that India produceth neer the River Nigua, as we learn from Thevet,... They chiefly feize upon the foftest parts of the feet under the nails, and bite venomoully. After four dayes they raise a swelling as great as a pease, or a Chich pease, and young ones like to white Nits; and if all these be not forthwith picked out, and the place affected burned with hot ashes, the part will be lost, as it falls out often with the Slaves in Numidia. He also in the Province of Peru was Subject to this mischief, and could not recover but by washing himfelf in the River very often.

L. 9. futtil.

Cardan writes of a little Flea. The West-Indies, faith he, brings forth a kinde of Flea called Nigua, a veryshrewd plague. This creature is far lesse then a Flea, that sticking to a man will so torture him, that some lose their hands, others their feet. The remedy is, to anount the part with Oyl, and shave it with a Rasor: To whom Scaliger answers thus. Thy story of Nigua is lame, yet not unprofitable if you confider Philologie: I shall adde what you have omitted.

dan. 23.

This little Flea hath a most sharp nib, and invades chiefly the feet, (seldome other parts) not ad fubiil. Car- only when men goe, but lye down also. Therefore the Indians lie high. Most frequently they bite that part which is under the nails. The fourth day the swelling begins to increase, and grows to the bignesse of a great pease. This swelling is full of young Nits; they pick out these, and lay on hot aftes. Benzo feems to fay the fame. The Indians are mightily troubled with venomous Infests. Amongst the rest the Nigue about the bignesse of a Flea, insensibly creep in between the flesh and the nails especially, and they are bred in the dust. It falls out oft times that no pain is felt by them, till they grow as great as Chich peafen or Lentils; and then with a wonderfull 🐔 Aluita 🤌 plenty

plenty of Nits bred, they are hardly pickt out with a needle or thorn: and this mischief is cured with hot ashes. Moreover, the slaves of Africa that the Spaniards have in their families, because they go barefoot; are shrewdly troubled with this plague, and they breed such numbers in their feet, that there is no remedy for them but the iron instrument of the fire, whence many of them want their toes or their feet. Fleas will dye from extreme cold, and therefore in the colder winter they are not to be seen; or else we kill them when we can catch them. And onedog will as willingly bite out the Fleas of another dog, as they will scratch one the other. Also molt bountiful Nature hath supplied us with a large field of remedies, that the Fleas that hide rhemselves, and leap away from us, may be destroyed by us, and we preserved from them. For we have herbs, Dwarf Elder-leaves, Fern-root, or Anchusa, flowers of Penniroyal, Rue, Coloquintida, Brambles, Oleander, Mints, Horse-mints, Hops, Rape-seed, Cumin, Staves-acre, Fleabane, Conyta, Saffron, Coriander, Celendine, Iweet Cods, wilde Cicers, Arlemart, Multard, Lupins, roots of Chamalea, Hellebore, leaves of black Poplar-tree, Bayes, Walnut-tree, with the oyls of these, or the boyl'd decoctions, if the pavement be sprinkled, or the house be perfumed, the Fleas will be gone, and most of them are killed. Above all, the dregs of Mares-pitte, or seawater are commended if they be sprinkled up and down; also Harts-horn burnt is very good. Goats bloud fet in a bason or a pit, drawes all the Fleas to it, as also a staffe and inted with the fat of a Hedgehog or Cony, Ape, Bear, Bull, or Fox, will do the like. The water of the decoction of Arfenick or Sublimate sprinkled is a certain experiment to destroy them. Quicklime mingled with the juice of white Hellebore, doth the fame. A Gloeworm fer in the middle of the house. drives away Fleas. Fleawort in the City of Chaire is powdred, and the powder is strew'd about the beds, which by its smell doth assonish the Fleas that they will not bire. If a Flea get into ones ear, pour in Oyl mingled with a little Vinegar or juice of Rue, oyl of Spike, Turpentine, or oyl of Peter, is very useful. These remedies may serve the turn, which are taken from Apfretus, Varro, Columella, Galen, Actius, Palladius, Avicenna, Rhasts, Kiramides, Guilielmus, Placentinus, Joanicius, Bellunensis, Hermotaus Barbarus, and Pliny. The Barbarians (faith' Lereus) that the Fleas may not bite them, anoint themselves with oyl that is thick and red, preffed out of fruit, which they call Course. Petrus Gallifardus, Calins Chalcagninus and Tagsee, are reported to have written the commendation of a Flea; it was my delire to have seen this, but it was never my chance.

CHAP. XXIX.

Of Infects that want feet, and first of Earth-worms.

COme earthly Insects that have no feet are bred in the earth, some in living creatures, some Din plants. Earth-worms by Plantin and Columella are called Lumbrici, may be from their lubricity. Also they are called the entrails of the earth, both because they are bred in the bowels of the earth, and became being pressed, like the entrails of living creatures they cast forth excrements, also became they are like them in form and fashion. The Greeks call these wises, success, success French, Vens de Terre; the Italians Lumbrichi; the Spaniards Lumbriz; the Germans, and those of Flanders, Erdwurmen: the Arabians, Charatits. Manardus Wittes, I. 2. ep. 4. that Earthworms were called Ovisculi. Earth-worms are greater or leffer.

The great ones, are long Worms, almost like those round ones that are bred in mens bellies, half a foot long, and firetched out a foot long; they are of a weak flesh-colour, and for the most part they have a ring or else a collar about their neck that is thick, wherein there is a little blond contained: they have no eyes, for no Worms have any. They first breed of putrefied earth, they are afterwards fed by the same, and lastly they are resolved to earth again. Those that you see wreathing little hils at the brink of their holes, as I suppose those heaps are their excrements; for in them we finde nothing but earth, the nutrimental juice whereof being fpent, they cast forth the rest as improfitable matter at their doors, and they are fenced by it against the rain falling in. At night chiefly when it is rainy weather, they willingly copulate, and flick fast till morning. They are not wrapt together in copulation like Serpents, but they slick fast together by their fides, fending forth a frothy kinde of spittle when they copulate: when they are in conjunction, they keep the middle of their bodies, that is the hinder half in their holes. and they are never fo fast glewed together, but with the least motion of the earth they can easily part: in rainy weather they are whiter, unless it be when they copulate, for then especially they are red. Gelner faith in the middle of April he diffected a female Earth-worm, that was vety thick, within the flesh through the whole body, a receptacle descends, that is ringed, covered with a thin membrane: when he diffected it, it flank filthily: in this is the earth contained that they take in; but above this receptable there lie white eggs very many heaped together, next the month.

The leffer worms, for clearer description fake, I will with George Agricola Call Ascarides, they are frequently found in dung-hils, and under heaps of flones: forme of them are red ones, they

CHAP. 29.

call them Dregs, and filters mich define them; some are wan-coloured, others have yellow sails. and are fo called; Iome also are with collars and are fat, others without collars and flender, which I take to be the males. These are bred chiefly in Autumn by reason of no plenty of monture, as Aristotle icems to affirm. Both kindes live long in water, but at last they die for want of food. They move from place to place with a certain drawing and pulsation, for the Philosopher faith they do not p operly tumble along. The great ones live in the bowels of the earth, especially in the open air, and where men oft-times retort. In the morning when they withdraw them felves into their holes, when the air is clear they fence them with earth cast up, but in rainy weather, they flop them by drawing in some stalk, they feed frequently on earth, but most greedily on a piece of white bread unleavened, as I learned from our Turner, a very credible man, and have oft-times seen it. Many of them dye if the Winter be too cold, or the Summer too hot. Moreover they are taken by Fishermen, and driven forth of their holes either by digging, and shaking the earth, or by pouring in some liquor of strong juice, as of Walnut leaves, Hemp, or throng Lye. It is good also in tempeltuous and dark nights to go into gardens filently, (which they milerably hurt) and to creep upon them when they couple, by the help of fire carried in a horn: for so in one night thousands of them may be intercepted and killed.

The Ule.

Uses of this despicable creature are observed to be many; and Nature scarce affords any simple that she hath beslowed more verties on against diseases. For Earth-worms soften, glew together, ease pain, and by their earthly and watry moisture together, they duly temper the part affected. Powder of Earth-worms is thus prepared: Wrap up great Earth-worms for some time in earth-moss, that so they may free themselves of that glutinous matter that slicks on their outward parts; then press their hinder parts next the tail, that they may cast forth their excrements and be cleanfed. Then call them into a vessel of white Wine and a little Salt, and gently preffing them with your fingers, cast away that first Wine: pour on more, and after the Worms are washed, take some part of this away also: for it must not all be cast away, as some would have it, till it be perfectly clear, for so that glutinous clammy quality would be lost with it, Thus p epared, they must be gently dried in a furnace, till they will crumble into dust when you torch them. Then the powder being beaten and fearced (it will smell like Runnet or Cheese) must be kept something far from the fre in a glass vessel. Otherwise ir is best to kill the Worms cut In pieces in Wine and Salt, and when they are dead, to take them out and to cleanse them. This powder with the juice of Marigolds, will cure the Epilepsie; with Mead, the Dropsie; with white Wine and Myrrhe of the Troglodytes, the Jaundies; with boyled Wine, Hydromel, or Wine, the Stone, the Ulcers of the reins and bladder; you may give a dram weight. In three cyathi of water they will break inward Impostumes, and bring them forth, if seven or nine of them he brought into powder. They stay also the Dyarrhoea, help Barrenness, bring forth the Secondine that flaies behinde, ease the pains of the Hip-gowt, open the Liver, cure Tertian Agues, kill and drive out all Belly-worms, given in liquors or decoctions that are proper for it. Also the decoction of Earth-worms dank with the juice of Knot-grais or Comfrey, is good against continual pilling, especially if it be also cast in by a Clyster. Also a Clyster of their decoction enferh the Emrods wonderfully. Some, where they suspect clotted bloud, give the decoction of Earth-worms to drink with great success. For the dileases of the Ears almost past cure, boyl them in Goose-grease and pour that in. Boyled in oyl for the Tooth-ache, and poured into the ear on that side the pain is, as Pliny saith, they give ease, or if you drop them into the contrary ear, as Dioscorides saith. Thus far for Earth-worms given inwardly, from experience and testimony of Dioscorides, Galen, Actius, Egineta, Myrepsus, Pliny, Vularis.

Allo ortwardly applied and bruiled, they joyn wounds and nerves cut in funder, and healthem in feven daies; wherefore Democritus would have them kept in Honey. Their affects with old oyl, cleanfeth corrupt Ulcers; and as Pliny Writes, consumes the hard edges of them, if it be mingled with liquid Pitch and Simblick Honey, Diefeorides faith Sicilian Honey is called Simblick. A certain Chirurgion now in England of good note, makes a liniment of Earth-worms and Honey, wherewith he anoints the tent, and sprinkles it with fine powdred Allum, and puts it into a Fifula, and so brings forth the core eaten out with no pain, and heals the wound. Also their ashes drawes forth things that llick within, and laid on with oyl of Roses cures Kibe-heels. Marcellus.

Serenus faith, that when the nerves are cut in funder, it is good to lay on Earth-worms bruised with Hogs-grease that is old and rank. Marcellus Empiricus adds Groundsel to the Hogsgrease and Earth-worms, with the tender tops of Box with Frankincense, and this he laies on the nerves cut or pain'd: Pling faith that the ashes of these and of a wilde Mouse, laid on for a plaister, with oyl of Roses, is excellent for broken bones.

For the great pains of Horses in their nerves or joynts, to help them, Russius, Absyrtus, Didymus, collect a great number of Earth-worms: whence Cardan gathers that they will ease all pains.

Mundella affirms that contraction of the nerves will be cured at you anoint them with oy lor Camomil that is well replenished with Worms. Marcellus saith that the same is done with Honey and Worms, as before. Actius faith without doubt they are an excellent remedy for the Gowt boyled in oyl, and a little wax : so saith Marcellus, but he sometimes mingles Honey with them. Vigo, for pains in the joynts, makes a plaister of these and Frogs, to which he adds Vipers-grease.

For pains of the joynts: Take ashes of Worms iii. ounces, oyl of Roses, or Foxes, what may

fuffice, mingle them to an ointment. Another that is fingular: Take the marrow of a Calfs lea compleat, and old oyl of Roses iij. ounces, Earth-worms cleansed with Wine and Salt ii. ounces. let them boyl in Balneo to the confistence of a Mucilage; with this anoint the neck, shoulders, and the places where the pain is, for it gives great help, Pliny. Marcellus anoints them with Honey. and then he laies on the Mucilage prepared. When any part is wasted and receives no nutriment, cleanfed Worms must be put into a glass very well luted, that nothing may breathe forth, and so fet in a warm oven or in Balneo, and they will then resolve into a clammy moilture; an admirable remedy and approved for the Palfie of the limbs : Take the aftes of tender Earth-worms iii. pounds, Ginger, Galanga, of each iij. ounces, with clarified Honey incorporate them for an Unpounds, with this for three nights together anoint the Patient, binding his arms forcibly over his belly or flomach, then cover him warm, and let him beware of cold. Jacobus deparma To drive away hoary hairs, women use these ashes mingled with oyl whilest they comb their head, as Plini faith, to whom Serenin Subscribes in these verses :

Earth worms and oyl of Olives, fice from cares, They will preferve a man from hoary hairs.

We faid before how they cure the Tooth-ache. But further the powder of them rubb'd on will preserve the sound teeth, and being injected will make rotten teeth, though it be a grinder, to fall forth ; especially, if the tooth be firth scarified, and fill'd with powder well sprinkled on it. Actius. Gal. 5. fee, loc. bids us do almost the same out of Archigenes. Also they are good with the root of Mulberries boyled in Vinegar of Squils, to wash the teeth. For purulent Ears, poured in with oyl they help much, as Gakn thinks, and cure their inflamations, being boyled with oyl of Roses. Aeitu.

If that your hearing fail, an old disease, Is our'd with Earth wornts boyled with Ducks grease.

Myrepsus bruiseth Worms with some small quantity of the earth from whence they were taken, and works them together, and anoints that upon ears that are bruifed. Marcellus bruifeth them with oyl of Roles, Celfus with oyl of Olives. Faventinus for pains of the ears anointeth the outward parts with oyl of Earth-worms, and also pours it into the inward parts. Marcellus bids to bruise Leeks not planted but sowed, odd in number, and as many Worms together, and boyl these in the best Oyl to thirds, and he saith that this oyl put into the ears is very good for their greatest pains and deafnels. Abinzoar cures clefts of the Hands and feet with oyl of Earth-worms. For an old pain of the head, they are held very excellent, bruifed with Vinegar, Frankincense, and Castoreum. Galen for the same prepares in his Euporists such a Remedy ; Take xv. Earth-worms, as many grains of Pepper, Vinegar what is sufficient, mingle them, smeer them on. Another: Take Earth-worms, Mouse dung, white Pepper, Myrrhe, each half an ounce, bruise and mingle them with Vinegar, and anoint that part of the head that the pain lies on. Myrepfus will have the Worms to be odd, and to be taken only with the left hand, and so superstitiously anointed. If thou wouldst try, faith Marcellus, whether a swelling in thy neck be the Kings-evill, lay a live Worm upon each swelling: if it be a scrophulous tumour, each Worm will turn to earth; if not, he will be alive and receive no hurt : so saith Pliny also. Earth-worms are a part of that noble Plaister of Arnoldus (2 Breviarii) of a Rams skin, or the bloud of a man that is red, against the Rupture: and Hollering commends it to cure Enterocele and Epiplocele. They also diminish the Stone, both taken inwardly, as also anointed on the share somewhat thick. Gal. What concerns womens diseases, bound to the neck they retain the birth, but contrarily applied to the hips, they draw the birth out and the secundine, for they draw mightily wheresoever they are applied living. Plin. Inflamations of the breafts, Earth-worms alone laid on will cure, for they concoct, open, draw forth, and heal. Alex. Benediet. So Myrepsu makes a plaister of them bruised. Lay on Earth-worms with Quinces, or with dried Barley flour, upon Breafts hardned or inflamed. Aetim. But if after delivery womens breafts swell, and to use the words of Serenne :

If the swoln breasts do feel great pain, Smeer them with Earth worms 'twill help them amain.

For they will concoct the Impostumes and suppurations of the breasts, and after concoction will heal them and void out the matter. For the Shingles, the Indians, faith Carolus Clusius, make an unguent thus: Take Earth-worms, and feed them Iome time with leaves, fine flour, or flour and milk, and when they are grown fat, boyl them in an earthen veffel (alwaies fcumming them) when they are strained, boyl them again to the consistence almost of a plaister, which well prepared will be almost of a yellow colour; dissolve some part of this in distilled water of Roses, and wash the part affected with it twice a day. A most excellent remedy, saith Clusius, and proved by very long experience. Pliny faith they will do the same in Vinegar, who together with Aeim and Myrepfus, affirms that Worms bruifed and laid on the place a Scorpion hath flung, are an admirable remedy, for they presently ease the pain, and correct the malignity of the tumour.

BOOK II.

O,1 of Earth-worms is known by all to be good against divers infirmities, and the Anciente made it thus. Take Earth worms half a pound, Oyl of Roses, Omphacine, two pound, the best white wine two ounces, let them boyl in balnee till the wine be confumed. This cures the nervee relaxed, contracted, aftonished, cut in sunder, or cooled, it easeth almost all pains, and wasts the flone, being anounted on the share and loins. But in the preparing of it, every man follower his own opinion. For some before they adde Oyl, wash and purge them with white wine, some neither wash them nor presse out the earth, and perswade to take the best wine, that it may pe netrate the sooner: Others use simple Oyl, not Oyl of Roses, others again Oyl of Chamomile. Also they shew us many wayes to boyl them, for one useth a surrace, another Balneum. another doth it in dung, and some mingle of Chamomil flowers, and of Dill, to assuge pains, some of Hypericon flowers to glew wounds together, others Shails without shells, others with shells, every one as he thinks fit. The Author of Bartapalia prepares an admirable water of Worms, fol. 254, that is very good for wounds and disastes both outward and inward. For Worms of Horses and Oxen Pelagonius, puts live Earth-worms into their nostrils, yet it were far better with a horn to put them down their throats into their stomacks. Tardinus bids give ashes of Earthworms bruifed with flesh to a Hawk, when she cannot mute. They are also meat for Moles, and when they dig, they will break out of the earth in wonderfull hafte. Sows (as V arro writes) will trouble the mud, and dig up the earth with their fnouts to feed on them. Albertus faith that Toads. Bellonius Lizards, Tarentinus that Sea Grampets, and experience faith, that Frogs, Eels, Gudgeons, Carps, Roches, Trouts, Darce, and Tenches will greedily devour Earth worms. Also that bird Aristotle calls ATE, some call it Vangellus, and Hens, and all Qualls will feed on Worms. But those are no wise Fisher-men, that cause Worms to come forth with medicinal juices, for when they are bitter the Fish will not bite, but if they lie a day in Wheat-meal and a little Honey, and then put upon the hooks, they relish better then Ambrofia: And it is no ordinary good we may receive by them, that they foreshew rain when they suddenly come forth of the earth, but if they lie hid the night before, it is a fign of fair weather. Some do harden Iron like Steel thus. Take Earth-worms two parts, Radish-roots one part, bruise them, and distill the water in a Limbeck. Or take distilled water of Earth-worms three pound, juice of Radishes one pound, mingle them, let Iron hot be often quenched in this water, and lie in it ten dayes, and it will grow very hard. Another, Take Earth-worms two pound, juice of Radish one pound, distill them at an easie fire, and remper your Iron with this diffilled water. Also draw forth juice of Sorrel, flinking Hemlock, and of round Aristolochia, of each alike, and temper your steel often. The juice of Sow bread is thought to do the same. Mr. Fakenbam a samous Physician writes thus. Another. Take Goats bloud, adde to it a little falt, let glased pots be buryed in the earth, well luted for thirty dayes, then distill the bloud in Balnes, and put as much of the distilled water to the same quantity of the water of Worms. Another. Take water of Worms, Rapes, roots of Apple trees, each alike, difill them apart, and mingle equal quantities together, and quench your Iron in that water, as we faid before. A Frenchman nameleffe.

The Theater of Insects: or.

CHAP. XXX.

Of Worms in living Creatures.

The Name.

Theorie thinks they are called Lumbrici from Lumbi the loins. For the Ancients call the belly Lumbos and paseldus by Hesiabius, and Suidas. Some interpret that, those that are sick of Worms. But more rightly from Earth-worms, which they represent in form and nature, doe they borrow that name. Cornelius Gelfus calls them Worms, Pliny the living Creatures of the entrails. The Greeks call them καμινθές, αξιμινθές, καμις, καμιγρές, ερίλος, and when they are extraordinary great, θπεία, as appears out of Ælian, l. 9. c. 33. You must observe, that Latin writers make difference between Vermes and Vermina or Verminationem, that is Worms, and diseases from Worms in the belly; for Vermina and Verminatio, are the pains of the belly from Worms, as Celfus, Serenus, Pliny, and Seneca Epift. 97. testifie. The Arabians call them Emicar, Sylvaticus Elingen, the Germans Spulworm, Bauchworm, the English Gutworm, the Sclavonians Sikrkawka, a word The Descrip hard to be pronounced. A belly-worm is a living Insect, without feet, bred in the bodies of living Creatures, hurting their operations diverfly. I faid a living Creature, that I might exclude those broad Worms called Tenie, which though they be of substance that grows to the guts, and are in form like to living Creatures, yet they cannot properly be accounted living Creatures, as Hippocrates 1. de morbis, rightly affirms. I faid an Infeld, both because they are of a round body, and because the Ancients do not reckon them amongst Serpents, nor have hitherto ranged them into any proper Classis. I said without feet, that I might distinguish them from Worms with feet. I said bred in the bodies of living Creatures, because they are not only bred in the guts of living Creatures, but in all the fleshy parts, and in the heart it self, as it shall appear by the history. And not only men are troubled with them; but also Horses, Calves, Dogs, Hogs, Hawks, and all perfect Creatures. I faid that diversty burts actions, because from them, pains, Consumptions, Convulsions, Epilepfies, Frensies, and divers other mischies follow, especially if they be very great, or very many.

And all these Worms breed either in parts that are alive or dead. The worms in living Creatures feem to be of three forts, the round Worms, Gourd-like Worms, and Afracides, fuch as are bred often in the Intestines of living Creatures : And not there only, but in other vessels and bowels : of which matter I finde there was a great controversie amongst the old Authors. For Galen 1.1. de which matter I linut there was a great controverse amongst the old Authors. For Galen 1.1. de loc. aff. c. 5. assigns certain diseases to certain parts, as worms to the guts, the Stone to the reins and bladder. But I my self with many other persons of the University, saw a stone as great and like a Pigeons Egge, voided by stool, at Gambridge, by Dr. Larkin the Kings prosessor in physick, who was long tormented with a pain of the Colick, and wasting, and he voided that stone in the fame form and magnitude, as a most troublesome birth at his fundament. Montuus and Benivennius write that they saw the like. Also by giving but one Clyster to the choise wife of noble Leonardus, I brought forth 35 stones like to Medlar seeds, at one time in the year 1583. Many there are that question the credit of Pedemontanus Arculanus, Guainerius, Trallianus, Benivennius, and Montuus, because (besides the opinion of Galen) they have written that they have more then once feen stones in the head, lungs, greater veins, the gall, bladder, under the tongue, in the joynts, and belly. But fince daily experience doth clear them from a lie, we may fay that the Greek speak, as Greeks were wont to doe, but that these men speak but the truth. Galen might have remembred, that Hippocrates, Epid. 5. fec. 12. did not rashly affirm, that there was a sharp stone pressed out of a womans matrix, by the hand of the Midwife, as great as the whirle of a Spindle. This I thought fit to premise, fest when I shall report them, the faith of others and my own experience that worms are bred almost in every part, others should think I relate either a thing very strange, or what is false. Worms seldome appear in the most vehement pain of the Hemicrania, vet Hollerius teacheth that it fo comes to passe sometimes, l. 1. c. 1. The Polonians call this disease Stowny Roback, the Germans Hauptwurm, and it was formerly frequent in Germany and Hungary, and all that were taken with it fell into the frenzie, or madnesse, and when they were dead, and their brains were opened, a Worm was found there. Then the Physicians gave Garlick with distilled wine once or twice a day, and all that drank of that recovered, the rest dyed. Philip Shot cured five of his servants that were fick of that disease, with the same remedy, as one writ in a Letter to Gefner. That Worms are often feen in the brain, Thomas a Vega faith, com in cap. 5 .l. de loc. aff. Galeni, and Balthafar Conradinus c. 10. de feb. Hungar. Also Cornelius Gemma, in Appendic. oparis Comocritic. disputing of a pestilentiall Semitertian, speaks of a woman in a city neer the river Mofa, that had a long and vehement pain in her head, when the was dead of it her brain was opened, and there was found a great quantity of filth, and abundance of Worms. That disease is known faith Rhasis, by the internal corroding of the forepart of the head, and by the most vehement pain, that almost makes them mad. It is cured by neesings, and juices cast up into the nostrils, that wil kill Worms. Rhafis, l. 1. c. 9. But the Worms that are yearly found in the brains of Stags, and sometimes of Goats, Sheep, Rams, (chiesly those that are fat) that Hunters and Butchers know better, than that I need to tell them. They are as big as the greatest Worms, and of the same form with them, as Alexander Benedictus and Matibiolus report. Theophrasius mentions these Hift. lib. c. 53. and Alexander Trallianus, l. 1. c. 15. It is reported that Democritus of Atbent, when he was young was troubled with the Falling sicknesse, and he went to ask counsell of the Oracle of Apollo, and Apollo answered him thus :

> Take a tame Goat that hath the greatest head, Or elle a wilde Goat in the field that's bred, And in his forebead a great Worm you'l finde, This cures all diseases of that kinde.

The young man was much troubled at this answer, and he repaired to Theognofius Democratine, that was then ninety yeers old, to tell him the meaning of the Oracle. This Theognofise told him that nothing could be plainer, for he had learned by long experience, that there were Worms in the heads of Sheep and of Goats, that being wrapt in a black Sheeps skin, and hanged about ones neck, would miraculously cure the Falling ficknesse. Some write, as Pliny witnesseth, that two Worms are found in the head of a downy Phalangiam, which Worms bound up in a Deers skin, and bound to a woman before the Sun-rising, would hinder conception. Concerning Worms of the Abdomen. A woman, saith Pennius, that I knew very well, told me that she had seen more than once, some round Worms, that crept forth of the belly by the Navel.

The Ancients also say, that oft-times Worms will breed in the ears, against which they prescribe these remedies. Take the juice of wilde Cucumbers, and the juice of Garden-sage, or that with broad leaves, mingle them both alike, and pour that into the ears. Gal. 1. 3. fec. lec. where reckoning up the Compositions of Andromachin for the ears, he highly commends this of Pritaria and Harpalus. Take Opium two oboli, Myrrhe, Spikenard, Saffron, of each three oboli, burnt braffe five oboli, and of round and Stell Alum, each one dram, black Hellebore two drams, mingle them with fod wine or Oyl of Roles, and apply them to the ears. Lib. Euporift. 2. he writes, that a Locust will destroy Worms in the ears, and he bids apply a sweet Apple to the ear, with a hole in it almost quite through, for the Worm will come forth, enticed by the sweet smell of it. Pliny much commends the root of Cypresse boyled in water, and the urine of a young boy, and the juice of Hemp, Rue, Bramble, and of Capers powred in. Lastly, many remedies may be fetcht from Bbbbb 2

Columella, Vegetius, Marcellus Empiricus, Trallianus, Vigo, Tardmus, and all the Arabians, and there-

1108

Medend.

fore here I supersede, passing on to other matters. Monardus prescribed to one that had a Polypus in his nose, the juice of Tobacco to be injected; whereby the Ulcer was purged, and many little Worms came forth: Wherefore they breed also in the nostrils, (for all the Arguments that Gabucinm hath alleadged against it) and are not only cast forth of other parts. Cow-heards know that Worms will breed under the tongue, and the Worm under a Dogs tongue (the carrying of which Worm about one, faith Pliny, will drive off the biting of a mad Dog) doth prove that fufficiently: And Valefour faith he hath feen Worms under mens tongues. It is known sufficiently by experience, that the very Breast and Lungs are not free from Worms; Antonius Benevennius, Benedictus Renius, Mundella, Antonius Siculus, are my witnesses, who have seen them cast up, not by vomit or reaching, but even by coughing. Also Alfaranius, Capite de Tuffi, writes, that sometimes a cough is caused from living Creatures bred in the hollow of the lungs, and cavity of the breast, which being no greater than little Lute-strings, yet when they creep from place to place they make one cough, and when they lie still it ceaseth. Also Abenzour Aokomeron. lib. 1. traff. 11. c. 3. makes mention of them. af. firming that the old Physicians saw and writ of them. Albertus and Gentilis saw some in the liver and soleen, and Platerus in the gall bladder. Wherefore, whatever Galen or Avicenna may say to overthrow this from the perpetual motion of the Lungs, the neerness of the heart, and other frivolous Arguments, yet there is no man but will fay, but that reason must give place to sense, especially in natural things. There was faith Hieronymus Gabucinus, a certain Noble woman of Fanes (in his Comment of Worms, to which we are indebted for the great part of this history) when she had a long time been tormented with pain of her stomach, at last she cast up a ball of hard flegme, this being diffected, it seemed like a piece of flesh, and in that there was a Worm, and thus the woman recovered, whom the neighbours thought to be bewitched. Of Worms of the Reins and Bladders. When the reins putrefie, or the muscle of the bladder, oft-times little Worms are cast out. concerning which I thought good to write these histories out of Pennius. A woman thirty six years old, had great pain of an Apostume in her reins, and she consumed, at length she cast forth little Worms, a fingers breadth long, which I first saw in the bottome of her urine, Anno 1582. Randuiph a London Physician, very learned and pious, when he looked on at the diffection of the body of one that was dead of the Stone in the kidneys, he found in one of the kidneys that was Remember the corrupted, it was wrinkled and putrefied, a Worm of a full length. Timothy Bright, a very skilful Cook of Queen Physician, and to whom we are much indebted for the Epitomie of the Ecclefiastical History, saw Murk that cast a Scholar at Cambridge when he lived there, that pissed out a Worm an inch and half long; but it pendra by ber was not without feet as Worms are, but it had many feet and was very nimble. Alogius Mundella nostrils, &c. Medicina Dialog. 4. Argenterius cap. de vesto. morb. Rondeletius lib.de dign.morb. c. 17. Scholiastes Hollerii lib. de morb. int. cap. de vesic. affec. (to say nothing of Levinus Cardan, and my own experience) do sufficiently testifie that such Creatures breed also in the bladder: That Worms come forth of the matrix, like to Ascarides, I did not only see at Frankfurt in a German woman, at eighty years of her age, but Aloyfius confirms the same in his Epistle to Gelner, and Hippocrates 2. de m. mulier. and Aunzour. lib. 1. trad. 2. have said the like. Kiranides writes, that there is a Worm to be found in the matrix of a Mule, which tied to a woman will make her barren. In India and the Countreys above Fgypt there are some living Cteatures like to Worms in form; (they are commonly called Dragons) they are in the Arms, Legs, Shanks, and other brawny parts, also in young children, they breed in secret places under their skin, and more apparently: When they have stayed there for some long time, at some end of this Dragon the place comes to supputation, and the skin being opened out comes this Dragons head. Paulus lib. 4. c. 59. Soranus granteth this, but he questions whether they be living creatures. Moreover, in the bloud it self some living creatures breed, like to Worms, that feed on the body, as Pliny writes, Hist. 26. c. 13. Plutarch 8. Sympof: who writes, that a young man of Athens voided Worms with his feed. Agineta faw them come forth at the groins and buttocks, as he faith lib. 4. to whom Benevennius subscribes c. 100. Also they breed under Sheeps clawes, (faith Columella) and fuch I have feen under the nails of those that were troubled with a Whit-flaw. And thus farre concerning Worms in the bodies of living Creatures. But such as breed in dead and corrupt bodies, (whether it be from the disease or the Chirurgeons fault) want a Latin name, but the Greeks call them Edda's, as appears by Hippocrates. The English call them Margots. Calius would also have them called Eulas in Latin, borrowing the word from the Greeks. We will speak of these in order. And first concerning Worms of the guts, the descriptions whereof, the causes, figns, symptomes and cure wil bring much light to the History of the rest.

CHAP. XXXI. Of the Description of Worms in the Intestines.

VEE shewed before that there are three forts of Worms that are bred in the guts. It will be worth our labour to describe what each of them is. The round Worms are the first difference, and that manifest to all men, because these are the most common, and are so called, because they are indeed round and smooth, not unlike to those worms that breed in dunghils and gardens, which we said before are called by

the Greeks, the bowels of the earth. There as all other Worms are blinde, without any eyes. and they are a hand length or fomething more ; yet Benivennim c. s. affirms that a Smith did vomit up a Worm with groffe flegm, almost a foot and half long, very plain, with a red head that was smooth, and about the bigness of a pease; but the body of it was downy, and the tail crooked like the half-moon. Also at Rome, anno 1543. one that was now upon his youthful years, when as for many daies (as Gabusinus tels the Rory) he had been in great torments of his belly, at last he voided by stool a great black Worm with black hair, five feet long, as big as a cane. He faw one allo that did not exceed the hands length, like to the round Worms, but that the back of it was hairy, and fet as it were with red hairs; but this being cast forth by using good remedies, he grew very well. One Antonianus a Canon (as Hieronymus Montuss tels the flory) voided a green Worm, but he died shortly after he had voided that. But for the most part they are smooth and not hairy, a hand long and not a foot, at both ends pointed, as it were with a nib. And they differ fo far from Earth-worms, that they wear no collar nor girdle : what concerns their colours, I have feen some red, yellow, black, and partly white, or gold colour. Green ones are seldom feen, yet Montum saw some. Gourd-worms are those quick Worms that are like unto Gourdfeeds; concerning which the question is so great between Gatucinus and Mercurialis; for when he treats of a broad VVorm, that is made of an infinite number of Gourd-feeds thut up in a skin; he faith thus: I, faith he, think a broad Worm to be nothing elfe but. according to Hipporrates, as it were a white shaving of the guts, that comprehends all the intestines, between which some living creatures are bred like unto Gourd-seeds: which may then be seen to be voided when all that shaving is voided, yet oft-times it is voided by parts : which if they break when they are voiding, then you may behold these Worms like to Cucumer-seeds voided by themselves, sometimes many of them being folded together, sometimes but a sew. But if any man shall see all that portion, let him know, that that scraping off like a Worm doth not live, but the creatures that are in it like Cucumer-feeds. I once faw this Worm called a Broad Worm that pants, to have been of a wonderful length, and it crawled, a woman in a Quotidian Feaver voided it by fiege, and when I did with admiration much view it, and fought to finde the cause of its motion: that other man, who said he voided a portion of a broad Worm some daies before, which he would shew unto me for a wonder, did shew it me with incredible defire I had to fee it; for this portion did move it felf, whence I was more defirous to know the cause of that. At last searching diligently, I observed through the whole hollow part of it, a rank of living creatures like to Cucumer-seeds, which crept forth of it as out of some bed sometimes one, sometimes two folded together, oft-times sour, or more, and that part of the shaving of the guts that was empty of these creatures did not move at all, but sank down: whence it comes to pass that I think a broad Worm is nothing else but snotty matter bred between the guts, or faivelly flegm thickned by the coldness of the guts, covering the infide of the guts like a coat, which women that affift the fick call a bed of Worms. Out of which snotty matter little living creatures like Gourd-feeds proceed, as by way of a conception, which is covered all over by the second membrane in the womb which is first made of the seed. So saith Gabucinus. Avicenna agrees in this opinion, Fen. 16. tratt. 5. cap. 2. the Gourd and broad Worms are bred from the clammy matter that is fathed in the superficies of the guts, which is comprehended by a flegmatick pannicle covering it as if they were bred from that, and did putrefie within it. Anionius Benevennius a Florentine saith the same, and more clearly, in com. de mirand. morb. causis, c. 87. who writes that in the mineral Baths at Avignon, that are in the Countrey of the Senones, he saw a woman that for seven daies together drinking the water, did void these Gourd-worms in abundance, that fluck fo fast together, one being close to the other, that they were in a rank that was above four cubits long, yet you would judge them to be but one body and one Worm. Johannes a Bookbinder at Bafil (whilest I studied Physick there in that Academy, under Zuingerus and Platerus my Masters, anno 1579) voided, such a Worm ten ells in length without any pain, and not many years before he had voided the like. It confisted of many Gourd Worms; without which it had had no motion nor feeling, and might defervedly have been rejected from the number of living creatures. Platerus had such a Worm dried that was eighteen ells long, I saw it. Pliny writes of a Worm a fick person voided, was three hundred foot long: wherefore whatsoever Mercurialia objects to the contrary, lib. 3. demorb. puer. cap. 7. fince experience proves the thing, is without any firm ground. He faith it cannot be that any living creature can produce fo many young ones, as there appear like unto Gourd-seeds; then, that the guts are not large enough to receive fo many young ones. Thirdly, that this comes to pass by reason of the violent putting them forth that gives the form, because the young one being broken by coming forth, is divided into those many pieces like Gourd-seeds. And hence we may conclude that those are tristes that the Arabians speak of Gourd worms, for smuch as there are none such: What is that I hear, most learned Jerome? that thou, being gray headed, and taught by long experience, shouldst so applaud thy own imagination, that thou shouldst dare to deny a thing obvious to sense, and plain to our eyes, and to Gabneinus Benevennius, and the Arabians? Go to, No living creature can produce fo many young ones like Gourd-feeds: why not I pray? when as one maid that took physick to kill Worms, as Gabneinus affirms, voided 177 round Worms? To say nothing of that Benevenius reporteth e. 85. of the incredible multitude of them: and he was a man to be believed. And what thou speakest of the capaciousness of the place, if that be an argument, it is an errour to be laughed at.

CHAP. 33.

1110

For the guts will contain not only as many as are in a Gourd, but the Gourd it felf prepared By thy last objection thou dost but mock, but canst not weaken the opinion of Avicemas and the Arabians: for as much as in bodies diffected, Gourd-worms have been feen wrapt up in a roll. wherefore they took not their Gourd-form from the violent voiding them at the fundament, or where ore they took not stem forth, as thou either inventest maliciously, or ignorantly befrom the manner of putting them Gabucinus, that there are Gourd-worms, and the broad worm lievelt. I conclude therefore with Gapherma, that living creature, but something about the entrails called Tenis, is not properly a Worm, nor yet a living creature, but something about the entrails like white shavings, as Hipporates saith, that is filled with these Gourd-worms put in fashion of a coat of Mill. Acarides have their name from Casto, because they bite and tickle very much, and fo exercise the patients that are troubled with them: others derive them from and to exercise the patients of the Ancients called them Beasts-worms, because they were feldom found in men, but often in Horses, Dogs, Hens, and Oxen. And they were so seldom feen in men, that Hippocrates, and Celsus that followed him, either knew them not, or thought them not worth the mentioning, and so they said nothing of them; and yet they writ at large of other Worms. They are like the round Worms, but ten times shorter, (for they are seldom above an inch long) and what length foever they be, they are thicker at the end of the longanum, and the sphincter of the anus they are found, causing a vehement itching in those parts. Galen writes in Lib. de Ling. Hippocrain, that Gous an old man called Ascarides long Worms; which difficulty Mercurialis casily opens, for we should read it, saith he, not waxpass great, but waxpass, small. Moreover, though in consideration of their breadth and thickness they seem long; yet compared with round Worms, they may be called short. These and round Worms are of divers colours, as the matter they are bred of is, or in respect of the heat that concocts them; but Gourd-worms are alwaies the same : whence I should conclude that Gourd-worms breed only from flegm, but the rest from all humours and excrements. Ascarides oft-times come forth in great numbers. and before they be voided they prick much-

CHAP. XXXII.

Of the Original of Worms in the guts.

A Riffolle lib. 5. Generat. and Hippocrates before him, 4. morb. make the material cause of Worms to be dung. Orthasius 1.3. Aph. 30. and Montanus that followed him being his Master, thought that living creatures might breed in the guts from all kindes of humours: and Mercurialis who thought they were deceived, was blinde himself at noon-day. But let us examine his Arguments: It is found, faith he, that they will not breed from bloud, because bloud never putrefies fo much, that living creatures may breed from it; Also he affirms from the judgement of Alexander Trallianus, that living creatures cannot breed in the veins. But experience cuts off the nerves of his first argument; and the Authority of Rhasis, Loppius and Pliny, overthrows the second. Also they cannot breed of a melancholy humour, because it is cold and dry; nor of yellow choler, because it is bitter, and such creatures are not sed by bitter things, but destroyed. For which opinion, though he urge Aristotle, Hippocrates, Galen, 4. simpl. med. Ægineta, lib. 4 c. 27. vet what is there more flender than the opinion of them? For Butchers know that in the milts of Sheep, which is the fountain of melancholy humour, and in the gall of Oxen, which is the receptacle of bitter choler, innumerable worms are oft-times found. And I fee no reason why Worms may not breed from yellow choler, as well as in Wormwood; from melancholy as well as in stones, from bloud as well as in sugar. But if they be not bred from them, whence have they matter that they breed of? The Physician of Padua will answer, It remains therefore that they can breed only of raw flegm, which either ariseth from too great quantity of the best meats for want of heat, or quantity of bad meats corrupt by depravation: which opinion, though it well agree with Galen, Egineta, Aetius, Avenzoar, Avicenna, Columella, Celjus, Alexander, and chiefly with our Mercurialis, yet in my judgement Hippocrates is in the right, who thought that living creatures are bred in the little world, as well as they are in the great. Therefore as in the earth there are all kinde of humours, heat and spirit, that it may nourish living creatures that breed, so bath man all kinde of moissure that nourisbeth things that breed. Moreover, when as these living creatures do represent perfectly Earth-worms, no man in his wits will deny but that they have both the same original. What flegm is there in the earth? yet it breeds round Worms, and Gourd-fushioned, and Ascarides, and all forts of Worms, and the best and warmest earth abounds with them, fo far is it that they should breed only of raw and corrupt humours. Do we not also daily see that Worms are voided by men that are in health? For I knew a woman of Flanders, that at Francfers on the Main, which from her youth till she was forty years old, did daily void some round Worms, without any impairing of her health, and she was never fick of them. I conclude therefore that from every raw humour of the body Worms may breed; and not only from crude or corrupted flegm. The formal cause depends from internal hear, which is weak, gentle, pleasing, and sie to breed living creatures; wherein that plastick force of Caleodick Nature, (to use the word of Avicemas) doth make the colours by the degrees of secret heat, and sporting her self doth make that broad form of Gourd-worms, and sometimes of Lizards, Toads, Grass-worms, Catterplilers, Snakes, Hels, as we read in Histories. This doth give them taste, seeling and motion, this gives them that force of attracting, whereby they sould never give the strings might perhaps dispose the matter that is changed by putresaction, but it would never give the form and figure of a living creature. For it is not because the guts are round, that round Worms are bred in them, as some mendream; but the external form depends from the internal, and the spirit drawn forth of the bosome of the soul it self, doth frame the shapes without a Carver or Smith. This spirit is the mediate efficient cause: but God himself is the principal cause in this and other things, in whom, as well as we, the Worms are, move and have their being.

The final cause shewes their use, which declares Gods omnipotency, Natures majesty, and the use singular providence of both for mans good. For there are collected in us some putrefied excremental superfluous parts, which the more bountiful hand of Nature changeth into Worms, and to cleanfeth our bodies; as we account it a good fign of health to be full of lice, after a long difease :: also they consume much superfluous moisture in mans body, and unless they grow too many (for then they feed on our nutrimental juice) they are a great help to the guis; fo far is it that they should be accounted by physicians amongst diseases, or the beginnings of diseases. Amongst the concomitant causes I reckon the place and the countrey. For though they are more common to children than to those that are of years, to women than men, in a pentilential than a healthful time, in Autumn than in the Spring, to fuch as use an ill diet rather than to those that keep an exact diet : yet they accompany all ages, sexes, conditions, seasons, diets; for no man is priviledged from them, yet some places or climates are free, for according to the nature of them, in some many, in others no Worms will breed: for all kinde of Worms will not breed in each part of the guts, but round Worms only in rhe small guts, Ascarides in the Longanum, the Gourd-worms only are bred in all. Alfo, as Theophraftus and Pliny testifie, there are no small differences amongst Nations and Countreys. (lib. bift, pl. 9. c. 2. Lib. Nat. bift. 27. cap. 13.) For broad or Gourd-worms are common amongst the Egyptians, Arabians, Syrians, and Cilicians : again they of Thracia and Phrygia know them not. And though the Beotians and Albenians are under the same Confines, they are frequently full of Worms, and these are by a priviledge asit were freed from them. He only will admire at this, or think it a Fable, who knowes not that the nature of Countrevs vary according to the position of the stars, the nature of the winds, and the condition of the earth. There is a River (faith Ariffotle, lib. de nat. anim. c. 28.) in Cophalenia that parts an Island, and on one side of it, there is great abundance of Grashoppers, but none on the other. In Prodofelend, there is a way goeth between and on one fide of it a Cat will breed, but not on the other fide. In the Lake Orchemenim of Baotia, there are abundance of Moles; but in Lebadim, that is hard by, there are none, and brought from other parts they will not dig the eafth. In the Island Itbaca, Hares cannot live; nor in Sicily, flying Ants; nor in the Countrey of Cyrene, vocal Frogs; nor in Ireland, as we know, any kinde of venomous creature. The reason of all this he can only tell, who hath hanged the earth in the air without a foundation; for it is not my eye that can fee to far, nor have I any minde to affect to know things above my understanding.

I leave that work to those that dare aspire To know Goas secrets, let me them admire.

CHAP. XXXIII.

Of the signs and cure of Worms out of Gabucinus.

Et us therefore shew the signs of Worms, beginning from those that are called round Worms; both because these do more frequently vex children, and because they produce more cruel symptomes: of which Paulus writes thus: they that are troubled with round Worms, are cruelly tornin their bellies and guts; and they have a tickling cough that is troublesome, and somewhat tedious; some have a hickop, others when they sleep leap up, and rise without cause; sometimes they cryout when they rise, and then they fall asseep again; their Atteries beat unequally, and they are sick of disorderly Feavers, which with coldness of the outward parts come thrice or four times in a day or a night without any reason for them. Children will eat in their sleep, and put forth their tongues, gnash their teeth, wink with their eyes, they will be very silent, and are angry with those that rowse them up, the balks of their checks, in a short time, are sometimes red, sometimes wan-coloured. If the Worms run up to the stomach, they cause nauseating, gnawing, and want of appetite; and if the sick are forced to eat, they scarle can swallow it, and if they swallow it down, they vomit it up again, they void many corruptions of meat by their bellies, and they are swoln like a drum, the rest of the body growes unreasonable lean, not by reason of hunger, nor immoderate evacuations. These things supper when these creatures creep and gnaw in the belly. A seaverish heat sends up ill vapours to the

CHAP. 33.

Worms, now follow the Prognofticks. The Prognofticks are very necessary in all diseases to know Proceed its.

Sometimes the pains abate, and again there follow torments, and Colique pains, with a henterie

flux of the belly, fometimes they are costive, and the excrements are hard. These are the signs of

what will be the event, and to know the condition of the patient ferves much for the cure, as

Hippocrates, especially in his Prognosticks, bath abundantly shewed; who in the beginning of his

book de prudent. Medico, hath delivered it: Especially foretelling here before the patient, things

1112

brain, that arife from putrid moifture collected in the ftomach. So writes Paulus: But Aetius out of Herodotus writes thus: Those that are troubled with Worms have a most cruel pain of their fromach and bellies, and they have a little frequent tickling cough, and yet they fpit up nothing: in their fleep they shiver, and rise preternaturally; some again put out their tongues and shut their eyes, and are filent, and cannot endure to be rowfed, and cannot watch for weaknes: fome have their eyes bloudshed, their pulses unequal, obscure, deficient, and recurrent : some want an appetite, children whilest they sleep, bite their tongues, and move their mouthes as if they sucked, or eat meat. But these things are done for a short time, and by circuits. Moreover some children besides reason, rife with crying, and presently fall down again: some crash their teeth, which it seems happens when the Worms suck, and gnaw their belies and guts. And now it appears that some are come up into the stomach, and cause loathing, and bitings: oft-times also by themselves they are cast upward, but sometimes with some flegmatick humour. Some Infants neglected lose their motion, and are benummed, and like those that are in a swound. they sweat a cold thin humour, and most commonly they are wan-coloured: sometimes the face will be red, especially about the cheeks, but this colour again is changed into more than ordinary paleness. Others again like dotards speak strange words in their sleep, others change their places they ly on, still sleeping, and they are vexed, and turn from place to place: but very few of those do cry, for most of them are void of reason, and are filent. Also they that are vexed with round Worms, loath their meat, and if they eat any thing, they cast it up again, or loath it so much they can hardly swallow it: for they fall into Feavers with vehement cold in the outward parts : some have their bellies swoln like a drum. So faith Aetim. But these are the marks he reckons from Hippocrates opinion: Worms in the belly are discovered by these marks: If they be fleepy, and the difease will not let them, and their outward parts be cold. and there be gnawing at their hearts, the urine troubled, and the tongue full of moisture; also they that have Worms in their Romach, are full of spittle; and if any little Worm comes forth they spit no more: therefore all those that have Worms in the mouth of their stomach, do commonly cast them up all by vomit, but those that have belly Worms, void them by siege. But they all nauseate, and vomit up what they take in. They are like to those that are pricked, that have contractions all over their bodies, and move suddenly and consusedly, and they have torments and pains of their guts. Vapours carried to the head cause Vertigoes. Moreover the manner of diet that the party used will show the generation of Worms, and all the rest. These are the signs of round Worms; but all these figns must not be sought for in every one, as Paulus saith; but fome and the principal of them. I might joyn here many things out of our new writers, unless what they say, and more also were not to be found in Avicenna, whence they borrowed it.

Signs of broa Worms.

Paulus gives us these notes of broad Worms: sometimes they abound in those that have Feavers and fometimes in those that have none. In Chronical diseases they breed gnawing the stomach, and causing a greedy appetite. They eat the meat so fast, that we need more, and if it be not prefent, they bite shrewdly; the body growes lean and weak, and unequal. But the most certain sign is, that some bodies like Gourd-seeds come forth with our excrements: so faith Paulus, and Actius doth not differ from him, but that he faith, that they gnaw the stomach continually, and cause an infatiable appetite, and that the meats eaten foon turn to excrements. They that are affected grow weak of body and fluggish, and are alwaies hungry, for what is living in the guts, when it hath confumed the meat, feeds on the body; but this fign will not fail us, if some things like Gourd-seeds be voided by stool. The signs Hippocrates gives are these: He writes after this fashion : There is another kinde of this, that comes forth like the white shavings of the guts; which hath these marks: The party voids seed like Cucumer-seed, and when he is fasting he is vexed, and spits much, his liver being affected, sometimes not; and sometimes when this vehemently affects his liver, it stops his speech, and he spits much, and after that it stops: and fometimes there is great pains in the guts, fometimes the shoulders ake, and then it stops again-Sometimes these are the signs of the broad Worms. He that is affected with this Worm, is almost alwaies in health, but when he growes weak, he can hardly endure it, or be recovered. For this broad Worm takes some part of those things that go down into the stomach, and if care be taken it may be cured, but if not, the Worm will not come forth it felf, nor doth it kill a man, but growes old with him, &c. Acarides are alwaies about the bottome of the belly as we faid, and there they cause a great itching almost continually, as Paulm and Actius have written; and sometimes, as it is reported, they will make one faint. For that is shewed by their name. For they moving alwaies do continually exercise a man and tire him out. They that are troubled with these, seel alwaies a heaviness about their Pracordia and backs. The signs of these are chiefly taken from the filthy smelling of the excrements. They that have Worms their eyes at first shine, their cheeks are wan, in the night they have cold iwears, their mouth is pale, they flart in their fleep, in the day they are more feaverish, their tongues and are dry lips, their breath commonly stinks, their face is pale, they nauseate and vomit often, they loath meat, they crash their teeth, especially in the night, they put forth their tongues (and they feem to eat) they are angry with those that awake them, they speak strange words, sometimes they are in a lethargy, and pick straws, and their heads ake, they cry out in their fleep, as the disease increaseth, their hearts beat exceedingly, their voice is interrupted, their arteries beat weakly, sometimes in the height of their pain, they are extended, and their mouth fomes as in the Epilepsie, their belly is swoln like a Tympany;

present, past, and to come, and what the fick have neglected, he is thought to understand the condition of the patient; and hence it is that men wil better dare to trust the Physitian. But because it is difficult to foresee all this, unlesse we use some artificial conjecture (I call that an artificial conjecture, that comes very neer the truth) and who can eafily attain this, unlesse he have learned the things that belong to the art, and remember them, and hath with all diligence exercised himself in the practice of it? The things wil be thus known. If a man suppose that there is any vital vertue. he must know the disposition of the patient in strength and weaknesse; and when he is persect in thefe he must study further to know all differences of diseases in the greatnesse and manner of them and then to learn the foreknowledge of the future state. And when he hath learned all these then he must exercise himself both in comprehending the magnitude of the disease by exact conjecture. and the force of the patient, and how long they may last. Now practife wil help him much in this: and before he hath diligently learned all thefe, it wil no whit profit him to fee fick people: wherefore they that professe physick, proceeding in this method, shal never undergo any disgrace, neither in curing, nor foretelling of future events, which they report fome famous Payfitians have fallen into. Hence it may be collected why fome Physitians are more fortunate then others, and what a fraud that is, to call a Physician more fortunate then another; how absurd that is, Galen and Exofification have shewed; saying, that a Physician must be exercised in all these things in his minde, and he must be diligent, and prudent by nature, that comparing all together, he may get a grosse summe of prædictions, that shal be useful for himself and for his patient. For such is the force of prædiction, that alwayes for the most part, what the Physitian foresces wil come to passe, where the Physician is perfect, and the fick doth not negiect his orders. But because, as it is evident, a Phylician by prædictions may get immortality almost, so chiefly from those things that do belong to this affect, he shal win glory to himself, by telling the sick their condition, who for the most part are children, or ignorant what their difease is. Since therefore Prognosticks are chiefly necesfary for this disease, I wil not fail to set down what the Ancients have written of this disease. Pau-Im a great follower of Galen, writes of these things to this purpose. Worms bred at the beginning of Feavers, have their subsistence from the corruption in the body, about the state of the disease, from the malignity of the difease, about the declining, they grow better. For Hippocrates faith, ic is good that round Worms come forth, when the difease comes to a Crisis. But Actius writes thus from the opinion of Herodotte a Physician. Worms breed in Feavers, and without, that differ one from the other in multitude, magnitude, colour, and time. For Worms bred at the beginning of a disease, have their being from the corruption that is in the body, about the vigour of it, from the malignity of the difease, about the declination, from the change to better, and they are soon also voided forth. Nature driving them to the outward parts as the doth the rest of the excrements. But the greater ones are worse then the lesser, many than few, red than white, living than dead. Our new writers adde to thefe; if round Worms are cast forth alive at the beginning of acute difeases, they shew pestilent diseases, but if dead ones be cast forth when the diseases decline, they are an ill fign also, however they appear both these times, it is bad. It may be because that Feaver that follows Worms is alwayes naught, because it consumes the matter for Worms. It happens also that the Worms are set on fire and grow hot by reason of a Feaver, and so are wreathed together, and moved, that they so much the more affect and trouble those that have these Worms. They adde further, that it is proved by experience, that Worms are in the belly, if in the morning you forinkle cold water on the mouth of childrens itomachs, for they will all gather to one place. Worms sprinkled with bloud, so voided is ill, for they shew great hurt of the guts, to cast Worms up by vomit is naught, for it thews the ftomach to be ftuffed with filthy humours. Frequent cold breathing of children, their bodies yet fwelling, is deadly, for it flews they will die the next day. If the eyes of the fick are somewhat held together, and cannot be closed by the fingers of those that stand by, death is at hand. Some there are, it may be following the opinion of Alfaravim. that fay that those who are troubled with Ascarides, are but floort-lived. But there is a great question to be resolved, and that being done, I shal put an end to those things that concern the Prognosticks taken from Worms. Aetim a little before said that live Worms were worse than dead ones. But Rhafis and Avicenna that follows him, think the contrary, absolutely preferring the dead ones before the living. In which question, to passe over other men, I shal say what I think, that the strongest affection is taken from those that are dead, because they must needs be driven forth, and cannot come forth of their own accord; yet I follow Hippicrates, who in a certain place useth fome words that are difficult, wherein he would have us to confider diligently what fymptoms VVorms breed, for if they come forth without any symptoms they foreshew a good sign. But he makes it clearer elsewhere thus. It is necessary that round Worns should come forth with the excrements, when the difease comes to the Crifis. So that by this we may understand, that if they be voided any other time, it is done rather symptomatically than by force of nature, and therefore they shew corruption or malignity, as Paulus and Aetius distinguished.

Afcaride.

The cure.

1114

But because we can never rightly undertake the methodicall way of curing Worms, unlesse the belly in which they are be well disposed, nor can this be, unlesse the whole body be so, and this is excellent well performed by good diet; wherefore that in the first place must be well ordered, for without that all helps are in vain, for the preserving and repairing our health. For this is so samous, and almost the best part of Physick, that that admirable Cous, Celsus, Galen, Pliny, and almost all the old Physicians, could never give it commendations enough. Asclepias formerly esteemed it so much, that he almost took away the method of curing by Physick, and wholly turned all curing upon diet. Now this confifts not only in the quantity and quality of meats and drinks, but alfo in all those things that befall us whether we will or no, as in fleeping and waking, motion and rest, as also in the repletion and emptinesse of the whole body and of every part, and in the affects of the minde, but chiefly in the Air that is about us, which not only flicks fast to us outwardly, but continually enters into the inmost parts of our body by the drawing in of our breath. As for what concerns those things that we take, because they are such things that every man knows. I shall say nothing of them. For there is no man ignorant, that divers meats, and of ill and naughty juice, and diforderly taken, will breed crudities, and that gluttony and drunkenness do our bodies great hurt, yet many kinde of meats, that are hurtfull in other diseases, are profirable in these. Wherefore we shall as it were besides our purpose, and by the way touch upon these, first adding what Paulus writes. Let the meats of those that have Worms be of good juice, that may easily be dispersed, and passe to the parts, and neither foster the cause, nor weaken our

Wherefore we grant them wine mingled with water, and let them eat often both for their need, and that the Worms may not graw them. If there be a fcowring of the belly, it is a fign that many are bred, the meat being not dispersed; and in that case Pears or Quinces must be mingled with our broths; Wheaten bread is a wonderfull help, having Annised mingled with it, or Fennel or Salt; or bread that is between Bran and Wheat, called our nouse there are joyned together in it, the Bran, the Hulls, and the Flour. Men call also this bread auromose, because all the Wheat, without taking anything from it, is made into bread. Also the wheat it felf that the meal is taken from must be the best, for some of these have much Bran, which is the courser wheat, but the finer wheat is the best. But wine that is mingled with water, because it gently bindes is held to be very convenient. Mountain birds are fit for their meat, and young wood Pigeons, green Groundfel, and Goats-beard, the broth of black Chiches, and Coleworts, and Capers, and pickled Olives eaten; and if there be no Feaver, let them eat their other meats with Mustard, also fowr and oyly things are commended. Also Panick (which Diocles called the honey of Corn) is most durable if so be it may be reckoned amongst Corn. Also Spelt in the decoction of Myxie, and a Prisane with a great quantity of Oyl of unripe Olives, besides these, Lupines, Cresses, Mints, Smallage, Radish, and sawce eaten are good. Give children before all meat, a decoction of Sebestens with Mints. Milk is very hurtful, as also Fish, and Pulse, and whatsoever is of a cold groffe substance, and hard to be digested. Bread unleavened breeds Worms, for it is good for no man, and so are all moyst

meats, that easily turn to corruption within.

For all kinde of Worms it is most convenient to use abstinence from such things as breed them . And when they are bred, it is good to eat often, a little at a time; and that is best, when they leave off gnawing. But those that have Ascarides must eat meats of good juice, and of easie digestion, that the force of them may not reach so farre as the right gut. For the matter fit to breed them is so consumed. Thus far for meats and drinks to be taken. But the other five kindes that are not so manifest, shal be handled by us also with all brevity. And we shal begin from sleep. It must not be too little nor too much, and in the night rather than in the day, at least two hours after meat. Moreover, to be long idle is naught, let exercise precede meats, and rest after meats. Nor is every motion to be taken for exercise, but that which makes us breath more; unlesseit be when we have taken Phylick against Worms; for then we must ride or run, to shake our bodies; for they are more easily cast forth by hard exercise or labour: but children will hardly observe these rules. Care also must be had, that the belly may twice be unburdened, and if that will not do of it felf, we must use a Suppository or Clyster to provoke it, made of such ingredients that are fit for this purpose. All affections of the minde whatever they be, must be set aside, as quarrelling, anger, forrow, great cares, and thoughts, sadnesse, fears, envy, and all such kinde of perturbations, and chiefly after meat. For these change and turn the body from its natural state. Let men beware of cold North windes, and let them not go barefoot. The air because it alwayes is about us, cannot be chosen at our pleasure: for it is sometimes a desence for us, and sometimes the cause that makes Worms, or fosters them: It wil be a desence if it be very hot, and dry, pure, clear, and calm; and it wil chiefly foster the disease, when it is very cosd, or moyst, or moved by the North or South winds, or by too great heat, diffolves our forces, and then by art it must be thus prepared: To burn in our Chambers wood of Juniper tree or of Citrons, or Peach-trees, and fuch wood as is against Worms. Also to persume the place with tops of Worm-wood, Peach-tree leaves, Citron pills, roots of Pomegranate-trees, also with Fern, and Ivy. But that is the best that is made with Myrrhe, and Aloes. Another remedy that succours the fainting spirits, by reason of Worms. Amber greece two penny-weight, Musk one peny weight, Gum Arabick, four penyweight, Roses, Sanders, Cloves, Privet, Frankincense, of each one peny-weight, Gallia Moschata fo called, fix peny-weight, Lignum Aloes burnt to a cole twenty peny-weight, the quenched coles of Vine-branches, what is sufficient, make them up with Rose Vinegar. Worms

Worms are oft-times exasperated with vehement remedies, that they bring children to Con- A general cure violations, fwoundings, and death; whereforethey are not rashly to be given, and at all adventures of Worms. But because that remedies by reason of their different qualities are thought to be good to kill and bring forth Worms, therefore in general, such remedies as heat, drie, cut, and are sharp, bitter, falt, or fowr, and attenuating, are to be used. For either they kill the Worms by their sharpnesse, or bring them forth by their bitternesse, or they allure them to come forth, or else they are known to be good to bring them forth by the loosenesse that follows. They are brought forth 'tis likely at once, by fuch supping means as make the passages slippery, or by some effectual quality, that is at once, by nucle supplies means as mane that effectually drive forth Worms, and some by a hidden quality, as shavings of Harts-hotn. But those things are best that kill the Worms, for so long as they are alive they are an occasion of mischiefe. And they are hardly driven forth when they are killed, wherefore they must be drawn forth by Clysters; otherwise they send a filthy virulent vapour to the brain, and likewife! inflame the body, and hurt the appetite and concoction. But because Worms happen most to children, who are hard to be dealt withall, I thought it not fit to conceal that wonderful way that Paulus mentions, whereby Alobs, and certain broths are given to them by way of suppings. A certain Cooks Instrument or spoon that is called Counterons, is put into their mouths as they lie upon their backs, and by a little Clyfler with a ftrong Pipe, Aloesis forced down their throats, holding their mouths wide open as far as it is possible. Polux makes mention of this, but doth not tell us what it is. But what foever Zomeryfit is, we understand two things by it, that it is made descending, that thereby the bitternesse of the Aloes is not tasted. But by that other Instrument that Paulus calls Clysteridion, it is forced in by violence. But force and nature concurring, the motion is most swift, the heavy matter running downwards, and is violently driven in by it. Paulu alfo describes another Instrument, whereby moyst things are injected into the fundament, it hath many holes quite through it, and these from the matrix are called Metrenchite: But Aetine speaks clearer thus. To which purpose you must provide a horn Pipe that is full of holes through it, large at the bottome, and convenient for the largenesse of the place, which being thrust in beyond the Sphincter of the Anus, we fill with juice of Cedar, so that the liquor may flie forth every way. But forasmuch as these Instruments are unknown to us, when remedies are given either to kill or drive forth Worms, ftop the childes noftrils, and then wash its mouth with some sweet or sharp thing, and when he hath drank down the medicament to kill the Worms, his stomach must be somented with Acacia or Hypocistis with wine. Those things that kill Worms are best given in fweet milk or honey or Oxymel, or syrup called Acetofie. Some firft fatisfie the children first with three dayes drinking of them, and then they give the physick afterwards. Alfothey give Clysters of the same sweet things, that they may entice those Creatures to the lower parts. If the belly fcowre, it is of necessity that the Worms must be killed at laft, for the motion of the belly will caft them forth. But when the appetite is hurt, and the belly loofe, the Worms must be killed with bitter things only, that are somewhat astringent, as with Wormwood amongst hot things, or Southernwood and Worm-feed: Or amongst cold things, with Pomegranate pills, Acacia, juice of Plantain, Purslane and such like.

Of hot things the feed of Cresses drives forth all belly-worms, brusted and drank in wine or Vi- Simple hot negar, yet more effectually if wilde Mints be added, yet it croubles the belly. The meet of Lu- medicaments pins licked with honey or drank in Posca, and outwardly applyed to the navel with Bulls gall, against Worms pins licked with noney or drank in roles, and outwardly applyed to the layer with Bull gall, againt worth drives them forth. The same also being insufed and eaten with their hitternesse, wild othe like, out of Diosco-drives them forth. The same also being drank with Rue and Pepper. Sea Worm-wood boyl. rides, Celsus, Also their decocition can do as much, being drank with Rue and Pepper. Sea Worm-wood boyl. Plins, Sciibe-ed by it self, or with Rice, adding Honey to it, kils Worms in the guts, and it wild oit better with nine, Largus, and it wild on the season of the same and season of the same and do by the same by its bitternesse. Cardamomm kils them. Also the same also the same also the same and Worm-wood. Southernwood do h the same by its bitternesse; Cardamomum kils them. Also the Galen, Oribasidecoction of Hysop drank, or the herb it self licked up with Honey. So Calaminth kills Ascarides, us, Paulus, and other VVorms, if it be drank with falt and honey, or if it be eaten raw or boyled, or the Actius, juice of it given in a Clyster, or drank. Also the decocion of Thyme, or Rue boyled and drank with Oyl forceth them out. Also wine of Cedar, and the liquor of Cedar it felf. Unripe oyl of Olives, if it be drank plentifully, for it is preffed out unripe for children. Juice of Oenanth hath the same operation, as oyl of unripe Olives. But the best thing against VVorms are sweet Apples called St. Johns Apples, for they loofen the belly, and drive out the VVorms; which by what faculty they can do it, (being they are sweet, and of a honey tafte, from whence they borrow their name, and fince fo they should rather feed VVorms) is perhaps, because by this meat the belly is made loofe, and the VVorms follow; and the VVorms that otherwife would flay within, by the force of the excrements, as Fifthes in a torrent are carried away, when in Summer great rains fall, and so are they carried downward. For Dioscorides lib. 1. cap. de Melimela, saith that those Apples make the belly foluble: Also the seed of Coleworts, especially that which growes in Egypt, drank, drives forth VVorms, namely, because the temper of it is drier, and more wilde. The same is done by Oyl of Palma Christi drank. Myrrhe also by its bitternesse both kills and drives them forth. The decoction of Elecampane, Squils taken with Vinegar and Honey, but the Squils must be first rofted, or otherwise it is held to be most pernicious to the entrails. Also they use to give against all VVorms the decoction of the root of Capers in honey and vinegar. And Dioscorides lib. 4. eap. 1. writes, that the herb called small Turn-foil, drank with the feed, adding thereto Nitre, Hysop, Cresses, and water, wil force out all forts of VVorms, long and flat. But Paulus, unless there bean error in the Press, reckons Cardamomum for Gresses, liby.c. 1. Rocket-seed in wine, wil drive out all living Crea-

CHAP. 33.

against Worms,

1116

tures bred in the body. Also seven or five Earth-worms drank with sweet wine, wil drive out all kinde of VVorms: Bitter Almonds and the Oyl is good. Agarick with Honey, but it purgeth with trouble; for it is hurtful to the stomach, by making it slippery and loose. Storax swallowed with Rofin of Turpentine: Aloes drank in cold water or milk, the same drank in a decoction mingled with Honey, brings them forth without trouble. The feed of Tithymal or the juice of it about five drops mingled with Figs or Dates. The leaves of Agans Castus, Polypode, Chamepythe, Centaury the lesse, bruised and drank with Vinegar. Also one peny weight of the root of the same drank in three Cyathi of wine, doth help. Horehound with Wormwood and Lupins, the same urang in three cyatha dike, and with wineapplyed twice or thrice, kills all Worms in the belly: Costus by its bitternesse, with water kills all Worms. But Dioscorides lib. 1, writes that is drives out only broad VVorms, with water and honey; which place Marcellus interpreting. blots out that word [and honey] as put in amisse, for this reason, because it is contrary, and seems not to agree with the cure for VVorms. For faith he, they are raised and nourished by sweet things, and belly VVorms are not driven forth by them, unlesse perhaps Honey must be therefore added, that they being deceived by the sweetnesse of it, they may take in the bitter Costus in greater quantity, as we use to do in curing children, when we give them bitter or throng potions, we cover them with some sweet savour, or pleasant smell. In which businesse he feems to feek a knot in a Bull-rush (as we read in the Comedy) and yet he consesset it to be otherwise. For whether the word Honey be read in Diescorides or not (for I am not yet certain of it, nor hath Ruelis fer it down). it is sufficient that bitter Medicaments, (such as Costus are, and such like) were given alwayes almost by Dioscorides, Pliny, Galen, and others, for to cure Worms, with sweet things, and chiefly: with Honey, or Mede, or Oxymel, for the same reason that Marcellus mentioneth, lib. 4. cap. 57. which Paulm added in these words. Because some men oft times refuse bitter potions, as having an ill tafte, of these thing herein comprehended, they shal not give any that are manifestly bitter. but mingled with some sweet thing, as he said a little before, that all these medicaments must be mingled with Honey or Oxymel, and so given to drink: Or as Lucretim faith, that the improvident Age of young people may be deceived, or elfe may be able to take it, being entited by such a tafte. For children most commonly are subject to Worms. Therefore nothing hinders but that the word Honey should be added, as Marcellin himself testifies, if we read him in some old Copies. Likewife a Cantharis bruifed, and drank with a Briony root, drives forth Worms, as Galen writes. lib. de compos. Theriaces. Of cold things, the juice of Mouse-ear, with Ale, of each one Cyathus. Groundfel eaten, the juice of Plantain, especially when the belly is 100se, given one spoonful or a small measure to drink, and the herb it self bruised, laid to the navel. Coriander seeds with the juice of Pomegranates and Oyl destroy the Worms! in the guts, or drank with sweet wine. Hot things, as boyled Beets, taken with raw Garlick, by the Nitrous quality it hath, brings them forth, but the juice is hurtfull. A Pomegranate bruised, and boyled in three Heminz of wine to one Hemina, drives forth Worms, takes away the pain, and the juice of the root one dram and half weight, will kill them. Sumach of Syria will do the same, and the seed of Orache. Our new writers adde, that it is manifest by experience, that the sharpest Vinegar drank when we go to bed will drive out the Worms. But amongst those things that prevail much is Coralina, so called, which being powred or mingled with Honey or Oxymel, or drank with Honey-wine, doth wonderfully kill Worms, or drive them out half dead. This rook its name from the likenesse of Corall, since both of them grow in the water, and for fixty years almost it hath been used to good purpose to drive forth Worms: if I be not mistaken, this is that which Dioscorides lib. 4 and Galen call giver ba-Admor, that is, Sea-mosse, and if that they did not attribute to it the same force we do to drive forth Worms, as we fee in Corallina, as they call it, I shal not therefore think that it is any thing elfe, besides Dioscorides and Galens gevor: For the Antients did not know the vertues of all Simples, for the true nature of each cannot be found out by any other way than by its effects in phylick. A mighty work and secret from God, than which there can be no greater found out. Also many things are found now adayes that were not found out in our forefathers dayes; and no wonder, fince these experiments are made by Countrey-men, and such as are ignorant of learning, who commonly live only where they grow, befides the negligence of feeking, when there are so many Physicians at hand every where. Also many things are found out that want names: To this we may adde the uncertain way of finding out; for in things that are found, some were found by chance, faith Pliny, lit. 25. cap. 2. others were revealed by God. But the fouleft cause of this rarity is, that they who know things will not discover them, as if they should quite lose what they acquaint others with. They are as envious indeed as those are who either suppresse the monuments of Antiquity, or elfe utterly demolish them; which they for that end, that what is written by the Ancients may be attributed to themselves, or if they have delivered any famous matter, they that write other mens opinions will let that be loft. But if there be any that will contend, and say it cannot be that they should be ignorant that Sea-mosse was good to drive forth Worms, to those I answer, that the Ancients did not commit to writing all the natures of Simples that they knew. For we know many of the precepts of Pythagoras and Socrates; which yet cannot be known out of their Books, because they wrote none. And Place though he lest so many Books in writing, yet besides those he wrote, his followers take many things for his that he never put in writing. Nor hath that from growing in every place, as they report, the same faculty, but the Apothecaries in some certain places of Italy fish for it, and they sell it under the name of Caralina. But let this suffice.

This is rather to be enquired into, why, being that Corallina tasts falt, Dioscorides, Pliny, Galen. and others report it to have a cooling faculty, when as it is known that all falt things are hot. and earthly, not unlike to bitter things that are hot? Whether it be, because the sea-water is falt, ver hath in it a great deal of potable water (as Ariffotle hath fufficiently demonstrated it) and therefore by that it is the less hot? Or else because it contains in it much earth, and so it is drier and thicker? But such things as grow in the sea, must needs be of the same taculty with it. Because therefore that Sea-mosse growes in the sea, Dioscorider and others attribute to it a thickning quality, but as it contains in it much water fit to drink; and as it is of an earthly quality, by that it cools. Lastly all that are troubled with Worms, are helped with the smell of the hair of Ichneumon (they call it an Indian rat) as Paulus writes.

The juvce of Houseek drank in Wine, will drive out of the belly round Worms: Worm-Simples sevewood Wine drank doth the fame. The herb of great Turnfoil drank with its feed, adding there sally that unto Nitre, Hylop, Cresses, and water, will cast them forth. The root of female Fern, bring forth a drams drank in Wine, will force out the round and broad Worms of the belly, as Ruellim Worms round, and Marcellur, who interpreted Dissorides, do both affert. But Galen faith that it kils not Afcarides, and round Worms, but Afcarides and broad Worms, for fo he writes, bb. Therapeat. method. cap. 14. broad Worms. But Wormwood can destroy round Worms broad Worms require more strong helps, as Fern is, and so doth that Worm the Greeks call 'A Case's. Theophrasiu was of this opinion, who writes that female Fern mingled with Honey is good against broad Worms of the belly, if it be mingled with Honey; and for Ascarides, in sweet Wine. For so he fets it down : Female Fern is good against broad Worms and small ones: against broad ones mingled with Honey, but against small ones in sweet Wine. It is certain that Ascarides both are, and are called small Worms. Moreover, Gaien lib de simpl. Medic. facult. 8. ascribes the same vertue to the female Fern, that the male hath. Now Pliny writes that the female will kill only broad Worms and not round. Plir, lib. bift. 27. c. 9. And again, that both, (that is, both male and female) will drive forth Worms of the belly, broad Worms with Honey, the rest with sweet Wine drank for three daies, and he excludes neither round Worms nor Ascarides. But Galen in one place excludes both round Worms and Ascarides; and in another place he writes that it will destroy Ascarides with broad Worms. What now shall we say, where Authors are of so many different opinions? shall we say that female Fern will kill all Worms in the belly? For Galen ascribes the same virtue to it he doth to the male, but that especially it kils broad Worms, and in the next place Ascarides, which being at the bottome of the belly, require a stronger remedy, as Fern is, that the force of it may come fo far. But since it can drive forth broad Worms and Ascarides, that are more seldome, and the one is in the guts, the other farthest from the stomach, it will far sooner destroy round Worms that lie in the upper guts. Galen therefore will not fight with himself in this, for it sufficeth if it will kill broad VVorms, and if it can destroy them, it can more easily destroy Ascarides, and easiest of all round VVorms. But Pliny, as who best of all knew that, saith it will drive out the rest also, (that is, both round VVorms and Afcarides). But that he faith so is manifest out of Paulus, lib. c. 58. who in his method of curing round and broad VVorms, mentions Fern: which yet all men agree is most properly used to drive forth broad VVorms. Avicenn. 16 Tertii trast 5. c. 4. shewes this most clearly in these words: The medicins that hill Ascarides are stronger than those that hill long Worms; and those things that kill long Worms and Ascarides will also kill broad Worms. Gith or Nigella not only eaten but laid in a plaister to the belly, or anointed on the navil with water, brings them forth. In which place we must note Murcellus, who saith it will drive forth broad VVorms and not round: but Ruellim interprets this by the contrary. It Marcellus have done right, I leave other men to judge, this is certain that Galen is of Ruellius minde, who hath written only that it will kill VVorms; and as I faid before, it is taken generally for round VVorms. Paulus and Aetim, agree with Ruelius, who in their curative method for round VVorms, often speak of Gith, but never for broad VVorms. Wormwood called Santonicum, of it self or boyled with Rice, adding Honey to it, will kill Worms. The feeds of Nettles bruised, or of Coleworts or Cummin, with water, or Mints with it, or Hyfop with Honey and water or Creffesfeed bruifed with Vinegar, kils them. Celfus I. 4. o. 17. Oribafius lib. ad Ennspium filium, hath written that Calamint, Cardamom, Lupins, and the powder of them in drink, or with Honey by way of Electuary, or given in Posca to drink, are sufficient to kill round Worms. Also the leaves and buds of the Peach-tree bruifed, and laid upon the belly can do as much; also Mints in drink and Sorrel. Purslain boyl'd, the juyce of Succory, or the decoction of Sebestens, or the Sebestens themselves boyl'd and eaten are very good. Also the ashes of burnt Harts-hotn is thought very effectual for this use, especially of that which growes on the right side of the Stags head. It is burnt thus: Break the Harts-horn, and put it into a new earthen Crucible, and lute it well, put it into the furnace and let it burn till it be white. Scribonius Largue, c. 141. gives it thus: Harts-horn, faith he, raspt with a workmans rasp, with water of Sebestens boyled, give 4 or 5 spoonfuls of it, which were soked the day before in 3 cyathi, then bruise and give it, adding the water to it. An Oxe shank burnt, and drank with Milk, drives out round Worms, faith Galen. Coffus with water drives forth broad Worms of the belly. Galen de com. Ther, ad Pif. Cardamom, Garlick eaten. The leaves of female Fern taken with Honey in a Lohock. But the root of the male 3 drams with Honey-water drank, will drive Ccccc

CHAP. 33.

them forth, but better, if it be given with so many oboli of Scammony, or black Hellebore. Alfo the root of white Chamæleon, drank a fawcer full, for which use it is drank with share Wine and the decoction of Origanum. Walnuts eaten largely, the pill of the Mulberry-root boyled in water and drank; besides that it loofneth the belly, it will force out broad Worms. also the decoction of Pomgranate roots drives them out and kils them. The decoction of Pomgranate pils can do as much. The root of wilde Bugloss a sawcer full, with Hysop and Cardamom drank, doth the like. Ruellius the Interpreter of Dioleorides, feems to have followed Paulus, who say that with Hysop and Cardamom: but Marcellus faith, with Hysop and Cresses drank, it will drive forth broad Worms, what was said before of Turnsoil. Marcellus seems here to follow Galen lib. 6. de simp fac. who writes that a fawcer full of it is good drank with Hyson and Cresses. But the juyce of Cedar kils Ascarides, and so doth Calamint, the juyce of it being drank or given in a Clyster. The decoction of Wormwood, mingled with ovl and given Clyster-wise, and the decoction of the lesser Centory given with Salt-peter and Honey. hath the same force, or the decoction of the wilde Gourd, of wilde Saffron, if the right intefline were first emptied with sharp pickle. The root of female Fern drank for three daies in 3 drams of Wine, drives forth Ascarides. Also old Hogs grease put into the Anus, is excellent

Both Paulus and Actius testifie that Feavers commonly accompany round Worms, and we cal Cure of found it true by daily experience. When therefore there is a Feaver, fometimes we must take round Worms, care to cure the Feaver and the Worms, and fometimes taking little care for the Feaver, we must strive to drive the Worms out of the belly. For many that have neglected them have died torn and eatenup by them, and some say they have seen them come forth at the groins. But we must first kill them all, and then drive them forth ; they are killed chiefly with bitter things. When therefore the cure is common both to the Feaver and the Worms, the more simple remedies are convenient, and where the disease is uncertain we must use things that are more milde. For the Feaver is exasperated with strong remedies if we should be mistaken; but when we are certain how the matter is, we must wait for the times of the disease. For about the first daies, and the rather if they should appear then, we must use stronger remedies. But those that appear when the disease declines, are more easily cured, and the better if there be no inflammations or tensions of the bowels. As Hippocrates faith well, lib. Apb. 1. cap. 24. In acute disease but seldome, and that at the beginning we must use purging Medicaments; and this must be done with premeditation, for these swell moit, and are agitated as 'tis often seen, and therefore about the beginning of those diseases, we may use sharper means with profit, but there must be much caution, and premeditation used therein. First examining whether the patient can endure such remedies, aid be prepared rightly for them, and whether we may expect a right Crifis by giving them. For there is no small danger in an acute disease, as the sickness of Worms is, to use sharp remedies, because all such means are potentially hot. Therefore they that suffer inflamations and extensions, must have Cataplasms of Linseed, with the like quantity of meal of Lupins mingled, or else moist fomentations of oyl of Camomil, Wine, tops of Wormwood, and Aloes laid to their Pracordia; but where moderate Feavers moleft, give children before all meats, the decoction of Myxato-drink, or give them the Sebestens themselves to eat with Mints. For these things wonderfully help those are troubled with Worms, either because, saith Serapion, they flick by reason of their sweetness to them, or else these are so glutinous, that they cannot be parted from them, and so must come forth with them. For Myxa are very clammy, that in Syria the best birdlime is made of them called Damask-birdlime : wherefore because by their clamminess they bring forth Worms, if they trouble the stomach, they must be given by the mouth; but if they be in the belly and guts, by clyster: but to such as are come to ripe years, stronger remedies may be given, as the decoction of Wormwood or Southernwood, or the force of the root of the fowr Pomgranat boyled to thirds, also three scruples of washt Aloes is given, which is the most commendable remedy for those that are strong : also we use unwasht Aloes, and both, if they be feaverish, and but three moneths old. Earth-worms with boyled sweet Wine may be given confidently; but if they will not drink sweet wine, give them with water and honey, or as you think fit, fearing nothing, not despising the meanness of it, give 5 or 7. But if it be not a naked suspicion, but a certain knowledge that there be Worms, and that a proper cure belongs to them, then you must lay on Cataplasms with Lupins meal boyled in sweet Wine, to which also sometime a root of Briony mult be added. In the mean time anoint the navil well with Buls gall, or Gith bruifed with womans Milk, or with Wormwood, or Southernwood, or Briony mixed with fat old Figs: anoint all the Spina dorfi with Deer-fuet, and cover the upper belly with a Cerate made of Wormwood and Cypress oyl. Moreover a Suppositar must be put up where the belly is bound, especially for children, and if it profit not, then give a Clyster, the vigour of the disease abating, made of the decoction of Wormwood, or Southernwood, or Centaury, with Honey and Nitre. And we shall endevour to draw them out by suppings, that make the passages slippery, such are oyl of unripe Olives, supping up by little and little two spoonfuls ofit, for asit is bitter it kils Worms, and as it is glib it drawes them forth with the dung. But we must alwaies increase the potions of oyl for they are very commodious. The Worms come forth, some yet alive, but they are giddy, and as we may say half killed, and many come out dead with the excrements. Moreover Worms will breed when there is a fcowring of the belly, we must

cure them by stopping the flux, and by bettering the concoction with meats and Cataplasms. For the more the flux growes, the more the Worms breed; and when the flux ceafeth, the Worms do the like: wherefore we must diligently endevour that the belly may be stopt and frengthned; we must therefore add to such Cataplasms as serve to stop other fluxes, such things as we faid to be good against Worms, and that cause no fluxes, such as are Wormwood. Southernwood, Santonicum; also Pomgranate pils, Acacia, Hypocistis, Balaustia, and the like, with raw Barley-meal. Also Cerats laid on must be made of these. Also suppings must be used amongst all which the juyce of Plantain is best; and the dry Plantain, for it is good both against the flux and the Worms. Farthermore the VVine of the Pomgranate preffed forth with thell and all helps exceedingly. But for nauseating that ariseth from VVorms, and gnawing of the stomach, a grain of Salt held in the mouth, and melted and swallowed down, profits wonderfully, for it thould feem the tartness of it, makes them presently fall down. But if a hickop arise from the same causes, pils are good, that have the juice of Ridder-spin, Wormwood, Santonicum, Water-mints, Scordium of each four penny weight, boyl them to the thickness of Honey, then add fifty penny weight of powdered Aloes, and make pils of all, and swallow a penny weight, for this will take away the hickop, and kill the Worms. But if from the Feaver or filthy vapours arifing from Worms, or the fumes of Medicaments (as most of thoseare that are given against Worms) rife to the head, fo that there be great pain thereof, then anoint the forepart of the head, the forehead and temples with oyl of Roles, or the juice of Acacia, or of Hypociftis mingled with it, for it is most effectual. Others lay on leaven with a little Saffron and Vinegar, on these parts being anointed: for this cures all intemperate sleep, and other perverse affects. But amongst Compound in those men call Syrups, syrup of Wormwood, Calamint or Horehound are commended: or make ternal Remeone thus . Take juyce of Mints, Elecampane root, Wormwood, Rue, purified, for it is taken dies to kill the sediment being cast away, of each of them has a hemina in weight; of the juyce of Succo Worms, ry and Grass, of each of them seven cyathi in weight, infuse in these torresied Harts horn, Sumach, Purslain feed, and flowers of wilde Pomgranates, strain the decoction and make up all with Sugar, or the purest Honey of Athens. Another: Take Southernwood, Calamint eight penny weight, Horse mints, Elecampane root freih, fix penny weight, boyl them in water to a third part: this decoction is given with fyrup of Wormwood, or Oxymel of Squils. Also Wormwood wine is much commended for these uses, but it is made divers waies, for some let down Celtick nard 40 drams bound in a linnen clout, into a measure of new Wine; and after 40 daies they strain it. Others cast a pound of Wormwood into 20 fextarii of sweet Wine, and a sixth part of Pitch, Rofin, and after ten daies they strain it, and lay it up for use. A syrup against Worms, with a Feaver and the symptomes: Take fixteen penny weight of Grass-roots, Purllainfeed, fowr Dock, of each eight penny weight, ten sebestens, boyl all to thirds, to these add the juyce of Pomegranates, and Oranges, or fowr Wine, of each one and half cyathus in weight, as much of juyce of garden Succory, the best Sugar what may suffice, boyl them to a syrup: you may give Infants half an ounce, and young children one ounce without danger. A Juleo that shall help those are affected with Worms: Take Dittany of Crete, Gentian Zedoary, Arabian Costus, one penny weight, seeds of Coleworts, Dill, Wormwood, Purslain, of each alike as much; water of Mints, Wormwood, Grass, of each half a hemina weight, boyl them to thirds and strain them, to these add of the best Sugar twenty penny weight. But in a Feaver you may give the decoction in water, or Grass-roots. Wheat, Barley, of each fifteen penny weight, to a large quantity to drink. Another most effectual and very sweet: Distilled water of Sorret, Roses, Grass, garden Endive, Bugloss, juyce of Pomgranates, of each or e hemina weight, seeds of Purllain, Orach, Sumach, Citrons, of each three penny weight; Coriander-feed, Myrtle-berries, wilde Smallage, of each two penny weight, feeds of fowr Dock, Coleworts, Cummin, of each the same weight; red Roses, Tormentil, Barberies, of each two penny weight, so much weight of Balaustia, five penny weight of the ashes of burnt Harts-horn, white Dittany of Crete eight penny weight; the hels of Mulberry-roots barked Fern-roots, of each two penny weight, ten Sebestens, one penny weight of red Coral, white Sugar what may suffice, make a Julep. But the most present remedy of all is that the Apothecaries call commonly Diaturpethum, but chiefly with Rhubarb, three drams of it being swallowed down; which being it is proved by long experience, so it hath also great reason for it, that it should be preserved before all other remedies. For children enticed by the sweetness of the Antidote, will take it down willingly, and the Rhubarb kils the Worms, and the parts are frengthned by it. The Turpeth drives them from their nests, and the rest of the ingredients do not only make it pleasant but harmles, so that it is most sweet, harmless and strong all at once : it is made thus : Take white Sanders and red, Violets, Ginger, of each two penny weight; Annifeed, Cinnamon, Saffron, Millick of Chius, each one penny weight; Myrthita, which the Apothecaries call Turpeth, eight penny weight; Rhubarb, ten penny weight, Scammony as it is usually prepared, four penny weight, the purest Sugar 195 penny weight, make up all with that and make Troches (as the Greeks call them from the form) each three drams weight, where you have need of them, give one for this disease. Another Antidote: Take Rhubarb, Saffron, Scammony, Wormseed, Dittany of Crete, each two penny weight, the best Sugar eighty penny weight, make them up with Grass-water, and make Trothes; one penny weight of this is given to Infants without danger, being diffolved in Grass-water. The powder I use is good, and a powder thus prepared: Take Rhubarb, Agarick, Germander, Cccee 2

Of lesser living Creatures.

Worms.

The Theater of Infects: or,

of each two penny weight, Sea-moss four penny weight, Wormseed and Pursain-seed of each two penny weight, unwashed Aloes six penny weight, give a scruple of this or two oboli in Wine to children sately. Sometimes all these are brussed, and sifted and made into pils with the iuvce of Wormwood or Mints, and three of them are swallowed down. Another for the same by ana. ther Author: Take Harts-horn burnt, the less Centory, Mints, Penniroyal, Water-mints, Wormwood, Santonicum, Germander, Lupins, of each four penny weight, bring all to very fine powder wood, Santonicum, Germander, Euphins, Otata Van Band, Another of the new Writers that is approved; and give it with Milk, Vinegar, or Oxymel, or any way. Another of the new Writers that is approved; Take Rhubarb, Coriander-feed, Bafil-feed, Plantain, Pomgranate pils, Carway-feeds, Sumach, of each two penny weight, Carduus Benedictus feed, shavings of Harts-horn, and of Ivory, of each eight penny weight, the bark of the roots of Mulberries pill'd, Colewort-feeds, Citron Appleeight penny weight, the bark of the foots of Malbertte flan, and Olitany of Crete, four penny feeds, bark of Willowes, of each fix penny weight, Purflain-feed, Dittany of Crete, four penny weight of each, Pearls, red Coral, of each two penny weight, dry them and bring them to fine weight of each, rearis, tea cotal, or each two powder; one or two drams of this with Wine in winter, and where there is no Feaver, or with Oxycrate in summer or to those that are in a Feaver is safely given. An Antidote that kils Worms, diminisheth a Feaver, and helps against pains of the heart: Take Wormseed, Sea-mois. feed of wilde Smallage, Harts-horn burnt white, of each alike, infuse them all three daies in Vinegar, wherein let these things first boyl, Purslain-seed, Sorrel-seed, Sumach, Coriander, Colenegar, wherein wort-feed, and a little Myrrhe; then dry them, and add to them Orange feeds two parts. Citron-seeds one part, make them up with Sugar dissolved in the Wine of Pomgranates, and make morfels, to which you may add some little Cinamon and Musk. But because it hath been feen oft-times that Medicaments outwardly applied have done much good against Worms, it is but reasonable that I should set down the manner of them: For by these we not only defend Compoundex our bodies, but also we kill the Worms and drive them out dead: wherefore this may suffice ternal Medica- and Horehound, bruise them with ments against that hath: Lupin meal, less Centory, leaves of Peach-tree and Horehound, bruise them with Posca and lay them to the belly. Another tryed by our newer Physitians: Take the less Centory boyled in the oyl of Peach-kernels, anoint the Navil with this, and it will drive forth the Worms. Another: Toft Barly-bread, and infuse it in Vinegar, then press it out, and infuse it again in the invee of Peach-leaves, lay it on warm to the belly with a linnen clout. Others mingle Lupine meal, Southernwood and Buls gall. Again: Take Lupine-meal, Centory the less, of each four penny weight, Aloes, Buls gall, of each 4 oboli, make them up with juice of Wormwood, and laid to children very young. Another: Take Wormwood, Gith, aftes of Harts horn, of each a like quantity, mingle them with Honey and anoint them. Another good for the stomach, that kils Worms, and is good against the belly flux : Take Wormwood, Mints, Roses, Santonicum, Lupinmeal, of each eight penny weight, tofted bread, infused in the sharpest vinegar four penny weight, Buls gall fixteen penny-weight, Mountain nard, Water-flag, (Gallia called Moschata) Cloves sweet Cane, Nutmeg, Galanga, Carway-seed, of each twelve penny weight; Hippocystis, Acacia, Sumach, of each four penny weight, oyl of Myrrhe, juyce of Mints, and Wax what sufficeth, make a plaister. If there be no Feaver, the navil and thighs are to be anointed with Honey, in a hot affect with Milk, and then a little Aloes is strewed on, for it wonderfully kils Worms, also the nostrils are profitably anointed with Theriac and Vinegar. A Cerute against Worms out of Paulus : Take Aloes, VVormwood, Lupin-meal, Seriphium, Gith, of each fix fcruples, VVax an ounce and half, oyl of Camomel what may suffice, make them up being bruised dry with Buls gall. Another out of Actius: Lupin-meal, VVormwood in powder, Barley in fine powder, of each seven penny weight; Buls gall, eight penny weight; rasping of Harts-horn, four penny weight; VVax, twenty fix penny weight; weak oyl, twelve penny weight, Another approved : Take Aloes half an ounce, Saffron two oboli, juyce of Pomecitrons as many drams, mingle them with sweet white VVine, and apply them to the heart. Another approved : Take Buls gall, 30 penny weight, choise Frankincense 128 penny weight, Strong-water 2 heminæ, distil, all these chymically and in a glass vessel covered with VVax, keep what comes forth, and use it when occafion is. Another very excellent, that kils and casts forth the Worms: Take VVormwood, Gentian, Centory the less, bark of the roots of Mulberies, Bay-berries with the kernels taken forth, bark of the roots of the Pomgranate-tree, Ash-root pils, of each 16 penny weight; Marjoram 14 penny weight; Southernwood Aloes, Myrrhe, Agarick, of each 12 penny weight, Dittany of Crete, Germander, Savin, of each 8 penny weight; Poly-mountain, Grass-roots, each 10 penny weight; Stachas, Chamadrys, Chamapity, Pomecitron-seed, each 6 penny weight; ashes of Harts-horn, Santonicum, 4 penny weight, Coloquintida-seed, 2 penny weight, Buls gall 24 penny weight, the sharpest Vinegar 1 hemina and 3 cyathi, a gallon of bitter oyl of unripe Olives, and 6 heminæ; let the dry things be beaten into most fine powder, and mingle them ten daies together, on the eleventh day let them boyl in a double veffel until the Vinegar be consumed; when these are cold, add one hemina of oyl of Bayes, bitter Almonds, and Peachkernels, of each beaten 24 penny weight ; all these, as the former, must be put into a glass vefsel, and be distilled. Another most excellent and sure .: Take Peach-kernels, Garlick, Earth-worms washed in Vinegar, of each 24 penny weight; Gentian, Dittany of Crete, Grassroots, and Piony, pils of Mulberry roots pilled, of each 52 penny weight, Saffron, sweet Cane. Cloves, Aloes, Calbanes, Coloquintida, Ginger, Nutmegs, Cassia, long Pepper, Frankincense, fruit of Balsome, red Coral, of each 8 penny weight; the best Theriack 12 penny weight, Mints, Wormwood, Centory the Less, Peach-tree leaves, headed Leeks, Penniroyal, Calamints, Plantain, Rue, black

Horehound, Bay-leaves, Sage, Marjoram, Betony, Scordium, Orange-pils, and bark of Mulberry roots, of each 16 penny weight; feeds of wilde Smallage, Purslain, Radish, Coleworts, Santonicum, Plantain, headed Leeks, sea Mosse, garden Smallage, (that is, Parsly) each 12 penny weight; the sharpest Vinegar, juyce of Quinces, of each one hemina; oyl of Mastlick. Spike. liquid Bitumen, (they call it Petroleum) oyl of Bayes, of each 16 penny weight; the oldest Ovl. or ovl omphacine, 8 heminæ; beat the dry things to powder, and mingle them, and in a glased vessel set them under Horse-dung for a moneth, then boyl them in a double vessel to thirds, firain them when they are cold, and straining them out forcibly, keep in a glass, what comes forth for your use. But employ it thus: first anoint the temples, then the nostrils, next that the foondyls of the neck, four of them next the throat, then anoint the pulles of the arms, next to that the stomach, I mean by the stomach the mouth of the ventricle, taking the word stomach improperly, for properly it signifies the throat; wherein I must not passe over the error of our new Physicians, who in affects of the mouth of the stomach, lay their remedies upon the back over against it, which is both contrary to Galen, and also to reason, 3. 6 10. de mirb. cur. libro. yet I believe Thomis Linacer did not rightly interpret that place, if I be not mistaken, who was indeed otherwise a very learned man, and most skilful in the interpretation of Authors; but it may be that Greek Book was faulty, or for fome other reason. Also it seems agreeing to reason, that for affects of the mouth of the stomach, the remedies should be applied before, immediately under that round griffle, which they call the shield or sword-fashion griftle, for at this place the mouth of the stomach best receives the force of Cataplasms and Cerats, forasmuch as there are no bones to keep it off, but the properly called stomach, that is, the throat is fenced with most strong bones, as under a fence ; for it hath the brest bones before, and the back behinde. But this is spoken by the by. Now between the wetting of one place, and of another, we must stay so long as a man might walk about 40 paces; and when these places are wet, we must use more distance of time, when we anoint the reins and the navil. And these three remedies are so certain, that unless a childe be ready to die, he will recover from the point of death only by anointing these parts. That which is called the broad Worm abounds in those that have no Feaver, and breeds The Cure of in long during diseases. The method to cure these is the same as for round Worms. For broad Worms, bitter and sharp potions are most in use, and to eat Garlick or Calamint, Dittany or Penniroyal; chiefly out of bitter and tharp potions are most in use, and to eat Garlier of Calling, Oribafi-we must eat Garlick largely for three daies, and old fost Cheese. Next let a man eat of Mace- us, Scribonius, donian Fern dried and powdred and fifted, 8 penny weight, with as much Honey as he please; af- Panlui, and ter four hours give the patient Aloes, and Scammony, of each one half dram, in Honey-water Acins. 4 cyathi, when he begins to rife to stool, fet hot water under; Also give water to drink in which Lupins, or the bark of Mulberry-tree is boyled, or to which there is added a fawcer full of Pepper, or bruifed Hysop, and a little Scammony : or else after the eating of Garlick we fpeak of, let him vomit, and the next day let him gather as many Pomgranate roots as he can vittoriaim, is hold in his hand, and bruise them and boyl them in 3 sextarii of water, to a third part remai- aplece of Moning, let him put a little Nitre to this and drink it fasting; three hours then past; let him take ney of 3 doli, two Potions either of water or falt pickle added to it; Then pour forth the hot water into a or half a dram, bason, as I said: also give Earth-worms to drink, for they are exceeding good. But the juyee of mouse-ear is proper for them, drank two cyathi with one cyathus of Ale: for it quickly drives forth the broad Worms. But this remedy following must first be drank; nor is it thought unfit for those that have Worms, especially if they have no Feaver. Out of Paulur. It consists of red Nitre, Pepper, Cardamoms, of each equall parts, mingle all thefe and give of them a spoonfull in Wine or hot Water, for it quickly brings them out. Another, which is an Electuary of Paulm. Take Pepper, Bay-berries cleanfed, Ethiopian Cumin, Mastick of Chies, of each alike, Honey what may serve turn, give one spoonfull in the morning, and let them sleep upon it; but if you would do this more effectually, adde Nitre as much as of each. Another of the same. Tike Fern a sawcer-full, Nitre two peny weight, give it with a spoonfull of water, after evacuation, but it is better to adde a little Scammony to it. Another of the same, and of Activis. Take of the bark of the root of a sowre Pomegranate, scraped from the . upper part, Pepper, of each four peny weight, Cardamoms fix peny weight, Horehound two penny weight, the best Honey what is sufficient, give one spoonfull of it after eating Garlick or Leeks. But that the disease may be wholly driven away, give some Theriac, for Galen highly commends it for this use. Another out of Oribasiu, that he alwayes used by the experience of his masters, and had

a long time proved it for good. It contains Scammony one Scruple, Euforbium as much and balf

as much, the powder of burnt feathers one scruple, Nitre in weight one Siliqua, give this to drink

in honey'd or sweet wine. But it will fall out better if he first eat Garlick or some sharp thing.

Also here is a Plaister of another Author, that is good against all Worms, especially broad ones.

Take Lupines, Bay-berries cleansed, Bulls gall, lay these on the navel, and binde it on with a swathe-

band for one day and night, or else for two or three dayes. Against broad Worms from another

Authour. Take Southern-wood, scraped Harts-horn, Coccus gnidius, and Sefamum, of each one penny

weight, Cardamoms three oboli, give this to drink with Oxymel. Another for the same use. Take

Gum Arabick, 'one peny weight, Fern three peny weight, Cardamoms one peny weight, Nitre

three peny weight, give it in Hydromel or Ale. Also against the same, is the Antidote called Diaphereon. Take Fern eight peny weight, Scammony, Gith, Cardamome, falt Nitre, of each two peny

C'cccc 3

Of lesser living Creatures.

CHAP. 35.

weight, give it in Oxymel or Ale, but adde Polypode four peny weight. It is reported, that Afcarides will crouble children, and fuch as are come to their full growth. But children are continually provoked to excretion, and after egestion they are the better most commonly, but those that are come to their full growth, observing the trouble of such things that are the cause of them, will thrult their fingers into their fundaments, and pull them forth, and further they will foment and abate these biting pains, with peble-stones that lie in the Sun on the shores, or else with stones put into the fire. But some for sear will admit of none of these helps; yet this disease ought not to he neglected, for Worms will not easily yeeld to remedies, nor are they easily driven forth, but by strong means. Wherefore children must be purged with Suppositars made of Honey and a little falt, or Nitre, or tharp pickle, or with the decoction of Wormwood mingled with Oyl. Also thereought to be a stronger purging, and when they have voided their excrements, the Longanum. ought to be a stronger party of the same o the juice of Sumach, with liquid Allome or Nitre, but the Compounds are the Troches of Andron. and those that are called Sphragides polydia, and with fat Wooll and such like; for the flesh is made ftronger by Aftringents, and loseth its readinesse to breed living Creatures, and thrusts forth the Ascarides. Andron his Troches are made thus. Take flowers of Garden Pomegranates ten penv weight, Galls eight peny weight, Myrrhe four peny weight, long Birthwort, and as much Vitriol. Saffron, scisiil Allum, dregs of the Oyl of Saffron, Mysi, Frankincense, of each two peny weight, they are powdered and mingled with aftringent wine, or with Vinegar. But Sphragis polydia is thus. Take scissil Allum three peny weight, Frankincense four peny weight, Myrrheas much, or eight peny weight, Vitriol two peny weight, flowers of tame Pomegranates twelve peny weight, Bulls gall fix peny weight, Aloes eight peny weight, make them up with sharp wine . But that which is made with fat Wooll is thus made. Take fat Wooll forty peny weight, lead powder, shales of Bitumen, of each ten peny weight, round scissil Allum, Pomegranate shells, Galls, Mysi, Vitriol, Frankincense, of each five peny weight, Myrrhe two peny weight, lees of Oyl eight Heminæ. Those that are of riper years must be purged with sharper and hotter remedies, as with Diapicra, and with Oyl mixt with wine, in great quantity, and other things infused, as salt pickle, the decocion of Centaury, with Nitre and Honey, or Coloquintida, Chamæleon, Anchusa, Lupins; then Ovl of Cedar must be given in Clyster, and after that rest; often repeating the same method of cure, alfo take falt flesh, scraping away the fat, and cut it long and round, and thrust that into the Anus. and binde it in, to hold it there fo long as may be, and then lofe it, and inject again the forefaid things, and let us often repeat the same remedies.

CHAP. XXXIV.

Of Worms that breed without the Bowels, and chiefly of Maggots.

THE living Worms that are bred in the head, the brain, the liver, milt, bladder, reins, muscles, proceed from the same causes Worms in the guts doe, and are destroyed by the same remedies. But those Worms Hippocrates calls Eulas, the English call Maggots or Gentils, they are Worms without feet, not unlike to Afcarides, but that they are shorter a little, and thicker considering their length : There is no man almost that hath not seen these in Carrion and corrupt flesh, and cometimes in limbs that are dead by the negligence of Chirurgions, when as they apply a remedy that putrefies together with the wound or ulcer. Hippocrates calls Eulas Worms bred in dead bodies. Suides calls them ill beafts, fle fh-eaters. Lucretim calls them cruel Vermin, and Plutareb, Worms from corruption and putrefaction of the excrements boyling forth. Homer in his Iliads, 19 and 24. faith they are Worms arising from putrid matter, that are far smaller in the ears than in other ulcers: And Caline writes, that they are called Eula, which Latin writers call improperly Earmoths, fince they agree with them neither in form nor figure nor in any mark whatfoever. Laftly, those small Worms that breed from Flies egges in slesh, in Summer, (the English call them Flieblowes, and the Germans Maden) as Camersian observed, are reckoned amongst Eule or Maggots. But those Eule or Maggots that breed in Hogs slesh or Bacon, have a proper name given them by Festus and Perottus, who call them Tarni, Maggets. Have either a tayl, or they are without a tayl: Hens feed on both kindes of them, and so it is likely other Birds doe. To make a woman conceive Hippocrates prescribes three or four parts of those that have tayls, bruised with Origanum and Oyl of Roses, to be laid to the mouth of the matrix. In his first de morb. mulier. and in another place of the same book, he bids apply with Wooll the heads of these Worms mingled with the Secondine of a woman, and Allum of Egypt, and goose grease.

It is reported that Democrates of Athens, when he was a youth, and was fick of the Falling ficknesse, went to Delphos, and enquired of Apollo, what he would advise him to take against this troublesome disease, and that Apollo answered;

> Take the greatest Magget you can finde In a wilde Goats bead, and fast binde That in a sheep-skin, &c?

Democrates

Democrates having heard the answer of Apollo, he repaired to Theognostus Democratus, who was then ninety yeers old, and he wondring at the providence of God, expounded this Oracle that was so doubtfull: Saith he, by nature the head of a wilde Goat is full of abundance of Worms, neer to the basis of the brain, and when he neeleth, many Worms fly forth at his nostrils; you must therefore lay a garment under the Goat, that these Worms may not touch the ground, but that you may catch them before, and so taking one or two of them, put it into a black Sheep-skin and binde it to your tender neck, and this laith he, is a natural remedy against this disease. These things are good against Maggots bred in ulcers and wounds in man or heast. First cleanse the parts as fected, with the gall of Frogs, the juice of Celandine, Sea water, or brackish water, with the decoction of Honey, Worm-wood, Horehound, Peach-leaves, Groundsel, juice of Betes, and Wine then to kill the Worms, strew on Pepper, Salt Peter, or Allum in powder, Hellebore, Henbane, round Birthwort, Vitriol, or wash the fore-places with the juice of river Calamint, or the decoction of Centaury, or with the juice of Leeks or Horehound. Johannes Agricola prescribes Buglos, but Pliny preferres Aristolochia with Honey; and Paracellus commends juice of Celandine. Montanus commends Nitre before all other things. Vegetius bids to wash the lores early in the morning with cold water, and to drench them throughly, for he affirms, that the Worms by this means will be so contracted with cold that they will soon fall down. Actius commends Poly, and Worm-wood mingled with Pitch, and he commends the anounting of the parts with fasting spittle. Hillegardin frews on the pith of Smallage, the shell of a Tortoile, Bees that are dead in the Hive, the leaves and the bark of the Plum-tree, powdered and sprinkled on the ulcers. Bayrus applies quick lime tempered with the sharpest Vinegar. The places where the Worms are being sprinkled with the juice of Hippia, will be presently cured, faith Tardinu; but what this Hippia is, no man hath determined : Some think it is wilde Tanfey, some say 'tis Potentilla, Gefnerse understands it to be Chickweed, which by its sharp and Nitrous faculty (as the Betes have) kills all the Worms.

CHAP. XXXV.

Of Nits.

Tits in the Greek are called Dorcas and Cumidas, the Italians call them Lendine, the Spaniards The Name Liende, the Germans Nift, the English Nits, the Muscovites call them Guida. These are lit- and Descriptle white living creatures, most like to Syrones, if they had but feet, but they are twice almost as tion. small; and their body is somewhat long, out of which Aristotle faith that nothing else can breed : Crackt between the nails they make a noyle and die, they are not found only in the hair and evebrowes of men, but they abound alfo in the hair of Oxen and Cattel that are leap, and wanting feet, yet they will flick so fast sometimes, that you may as easily pull off the hair by the roots as pluck them off. Trotula not improperly calls them respelleurue, hair-eaters, for as Snails live on the juice of herbs, fo thefe live on the moysture of the hairs, and feed thereon. The Philosopher Their Origiaffirms, that they proceed from the copulation of Lice, and therefore are called their egges. They nall, are like to the flowers of Jesemine that grows with us. For as Jesmine brings flowers without kegt To Lice bring forth egges without young ones in them. They die either for want of nourishment for Their End by using a Comb with close teeth, or by the use of such Medicaments as the old and new Phyficians prescribe abundantly. Pliny mingleth Allum with Vinegar, or Vinegar with goll of a Calf. and also faith, they are killed with Goats milk. Also he commends Nitre mingled with Terra Samin and smeered on, and the powder of Harts horn drank in wine. Abenzoar prescribes, to anount the hair with the leffer Centaury, and Alkitrum. Brimstone in Vinegar takes away Nies, as also Oyl mingled with Lie. Marcellu doth very much commend Hogs dung mingled with wine and juice of Roses; also to anount with Honey and Sal Armeniack, but chiefly Oyl of Radishes with a strong lie. Hildegardis provides a lie made of Date-stones, which being mingled with Oyl of Radifhroots, will kill the Nits. Ardonu mingles fome fublimate of Quick-filver with spirit of wine : And he faith alfo, that if the head be first wet with a Hensegge, and then with the juice of Sowbread, or Sea-water, that the will never breed again. Gilbert an English man highly commends the gall of any Creature, as allo all bitter things, cleanfers, and Aromatical Drugs, with the juice of Marigolds.

CHAP. XXXVI.

Of Aurelia, and a Wood-worm called Teredo, without feet.

Hat which the Latins call Aurelia, the Greeks call xevenths, the name is borrowed from the gol- The Name den colour which appears in most of them. It hath no mouth, nor yet any apparent parts, and Descripmor doth it void any excrements, nor yet eat, or move, unlesse it be moved by some body, or hurt. tion, That which Pliny writes, that a Chryfallis hath a hard body, I think that is meant in respect of a Catter-

The kindes.

Their End.

1125

Catterpillar. But that which he addes that it will move if a Spider touch it, though I know this to be true by experience, yet I doubt he borrowed those words from the Philosopher, and interpreted them amife. For the fense feems to be thus. They move if they be touched, and they are covered with pa es like to Cobrebs. Aristotle speaks nothing here of a Spider passing over them, as Pliny feems to translate it. Aristotle shuts the Autelia not only our of the number of Insects, but also of living Creatures, and determins them to be as it were the Caterpillars egges. But what agreement is here with an egge? That is laid by another living Creature, and is void both of actual life and motion. The Aurelia is laid by none, but is changed from one to another, for it changeth its former shape into another shape, and retains both life and motion, not in possibility of being, but actually. But that doth not take away the life of it, because it neither eats. nor increaseth, for Dormice sleep all the Winter and eat nothing. The life of it doth resemble that sleep which is partly waking, wherein men are not properly awake, nor yet asleep; but are alive, and move a little. But I conjecture that the Philosopher wrote this, that he might confirm that Axiome of his to credulous posterity, that all Insects either lay egges or little Worms, His words are these. Infetts first breed Worms, but that which is called Chryfallis, is an Egge, and afterwards from this is bred alwing Creature, that at the third changing hath the end of its generation. Yet it is manifest enough by what I said before, that an Aurelia is no Egge, and it ought not to be called a generation, but a transmutation of a Caterpillar into this, and of this into a Butterflie. I fay this for that purpose, that such as adore Aristotle for a God, may remember that he was but a man, and that he was subject to humane errors. There are two kindes of Aurelias that I have seen, some are downy, and others smooth, both are of divers colours, and fometimes they are Gold coloured, which are the true Chrysallides, and others Their Origi that are but battard ones, are without any colour of Gold. They have their Original from the death of the Catterpillars, which as they do waste by degrees in certain dayes, so by degrees their covering grows continually more hard, and changeth into an Aurelia. These again the next Spring or Autumn, by degrees losing their life, a Butterflie comes forth of them that is bred by the like metamorphofis. What use they serve for, for the good of man kinde, I am wholly ignorant of. I know well enough how much they perplexed Aistotles wit by their won-Their Ufe. derfull transmutation; and they set forth to us the boundlesse power of Almighty God.

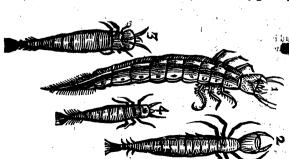

George Agricola only propounds to us the Teredo without feet, which from the brasen colour of it, he call Kupter-worm: It creeps like a Serpent, faith he, because it wants wings and feet. It is as thick as a small Goose quill, and it is as long as a Scolopendra: It is round, and breeds under rotten wood, and sometimes found hard by the Scolopendra, or long Ear-wig. You may

easily finde the figure of it placed amongst the Scolopendræ.

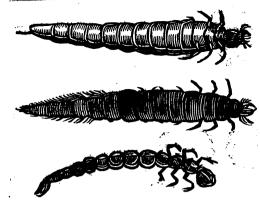

CHAP. XXXVII.

Of Water Infects without feet, and first of the Shrimp or Squilla.

WEB said before that all water Insects were with seet or without seet. Some of those that have seet, swim with six seet, as the Lobster, the Shrimp, the lake Scorpion, the Evet, and the Sea-lowse; others with four feet, some with more. We shal treat of them severally. The Squilla an Insect differs but little from the fish Squilla, but that it hath the failyards much shorter, and a more red colour, or rather a more earthly colour. Some of these are covered with a thin shell, and some again are smooth and naked. Those with shells live chiefly in small Brooks, and stick to the roots of Reeds or water-flags: They are of a yellowish colour, and fometimes of a white or Ash-colour. They go only with fix feet, the rest that are

joyned to them, ferve in stead of fins. The naked ones are either foft or hard. The foft ibipones are represented well eough by this figure, only suppose their heads to be of a bright Bay colour, and their body died with a dark Ash-colour. All those that are covered with a hard crust are made with joynts, but some have round joynts, others other fathions. The form of the round joynted is exactly represented here, if you suppose him to be easily dyed with a lighter red. And fuch is the colour of the first and

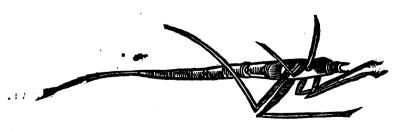

Of lesser living Creatures. fecond that are not round joynted. The third kinde is black upon the back, and with a brown belly; but they are all with a torked mouth, and that will hold fast what is applyed to it. The fourth kinde moves it felf with the three former feet, and ufeth the reft that hang by its flead of Oars. The neck of it, and the failyards, and the nippers are of a warry red colour, the body is brownish or more Ash coloured. The fifth hath a very black head, and the body like to a Pomegranate shell. The fixth feems to be critel, and in the fame form you fee it, of an Afh-colour. All of them have stard eyes, and black, covered over with a membrane fhining like unto glaffe, which move continually almost, like to the ears of fourfooted beafts. They leap quickly one

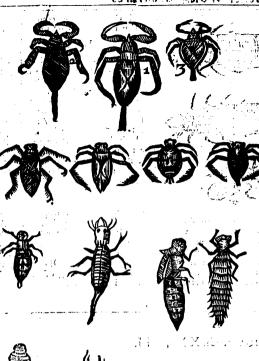

upon the other as the Fishes Squillæ doe in coupling, and when they grow bold and have liberty, they fill the Females with young. The time when they are ready for this is fignified by a gentle biting: The Female takes hold with her mouth, and what the layes hold on the kills, and gives part of it to her companion; for they couple at the mouth, as Crabs and Lobsters doe. But what use they serve for in physick, I cannot finde either in writers or from Empiricks, who either knew not these Squillæ, or thought them not worthy to say any thing of them. Yet this is certain, that in April and May there is no better bait to catch Fish with.

CHAP. XXXVIII.

Of the Locast, Scorpion, Notonectum, the Grashopper, the Wasp, the forked Claw, the Newt, the little Heart, and the Lowse, all Water-Insects.

HE Infect-Locust, is like the Lobster, for that cannot be called either flesh or fish: you fee the figure of it: it is of a pale green colour: I have feen three kindes of Lake Scorpions, and I have them by me: the first is somewhat black, the other two are like to white

fand: we call some Insects of the water Noton Ca. which do not, fwim upon their bellies as the rest do, but upon their backs, from whence it is probable that men learned the art of swimming upon their backs also. Some of these have eyes, shoulders, and bodies all black. some are green, some are fiery coloured, and some pitch co-loured. For you shall seldom fee two of them of the fame colour; nature hath fo varioully sported her self in adorhing them. Water-Grashoppers hold the farm described, but their eyes are described, but their eyes are described black, and their bodies are as coloured. The Wasp hath a brownish body all over, except the black eyes. The Forked Claw hath almost the same colour, but it is more full, it feems to want eyes, but it hath them hid within, whereby it both fees, and perceives the object. The Lizard is of divers colours, and delights in catching Fish, it is common about the British shores, where it lyeth in wait to catch Fish. The Corculus bath the just fashion of a heart, the feet and head being taken away; it hath very little black eyes, and fix legs of the fame colour & each with two clayes. The Sea-Lowfe is an Infect that is an enemy to all kinde of Whales, which by biting and tickling it puts into fuch a rage, that they are forced to run upon the fand, and haften to dry land? I know nothing concerning the use of these creatures; but I seriously exhort posterity to fearch out the lufe of them.

CHAP. XXXIX.

Of the Flea or Asellus, and the Scolopendra found in the Sea.

THE Flea, or Sea Asellus is like to a soft Squilla, but it hath but sour seet (as I may say by Gesners leave) and by often and long leaps it frees it self from having many seet. It is called Asellus from its leaping, Mristele cals it a Flea; from its bunch-

are bred, and do live.

CHAP. 29.

back it is called a Sow: it is of a wan colour with blackness; the length of those that are in rivers is the breadth of ones singer, and their breadth is not above half a singer broad. But the Sea sleas are larger, which when the tyde slowes are seen also oft-times in fresh waters. It shewes a wonderful deal of agility when men strive to catch it, or do but look upon it.

The Sea Scolopendra, sometimes is of a grey colour, and sometimes you shall see others that are more red. These are longer and leaner, that is shorter and thicker. I saw both kindes in the year 1578, in coves of Oysters. For they are not found in the deep sea, as Gesser supposets, but in the muddy standing waters, where the Oysters are fatted, there they say hid, Numerical Fisher-men concerning these, when he said;

See therefore that you let not ingender, The stupid Julii or deadly Scolopender.

They are as Ariftotle writes lesse than the land Scolopendras, but not differing in their form. Norus the Physician makes of these a remedy to hinder hair from growing, or a depilatory, and highly commends it in his 34. Chapter. Take Frankincense, Vitriol, of each two ounces, sea Scolopenders three ounces, grinde them all well, and mingle them with the powder of Quick-lime, then pull out the hairs first, and anount the places with that.

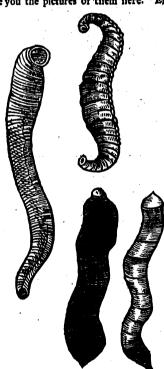

CHAP. XL.

Of Water Insects without feet, and first of Oripes.

O Philosopher that understands as he should, will deny but that snow is water turned to froth, by long subliming in the air. In this Worms are bred which the Greeks call seems. Aristotle writ something concerning these, which History I will briefly touch. In snow there are bred hairy Worms, very sluggish, and that move slowly, wherefore I reckon them amongst Worms without feet, so soon as they are taken out of the snow they die, as the Worms bred in the fire doe, being taken from thence: with from that is old and begins to look red, they become red also, but those that are sound in new snow are white. It is, saith he, a certain thing that snow can no more corrupt than fire can. And indeed they cannot corrupt, yet in both of them are living Creatures bred, and they are nourified in both. I cannot in any wife consent to Euffathim the Scholiast upon Homer, who affirms, that snow growes red from Minium, because those places are of a Cinnaberous quality, whence he conceives, that from the vapours rifing from Cinnaber, the snow becomes red: I will not deny but that it is fo in some places. But whether the Interpreter be pleased or not, we must needs grant that in fome places the snow grows red, where no Cinnaber is. Strabo makes mention of such places in these words. In Chargena and the Countrey of Cambicium, and in places neer to the mountains of Caucaju, some little beafts are bred in the deep snow, which Apolonides calls oranges, and Theophones Seines, that is, Mountain little hairy Worms, like unto the greater Teredines. I think their generation as admirable, as of the fire Worms; yet living Creatures are more eastly bred in fnow, than in fire, because in snow there is much air, earth and spirit, all which the fire consumes abundantly. And if the heat of the Sun happen to be with these, I shall use &caligers words, they make dung that smells the sweetest of all ordure. Also they are bred in abundance in Carinthia, as Joath. Vadianus reports. But Strabo in his Comment upon Pompen. Mel. addes a thing that is admirable, faying that these Worms are full of excellent water, which Travailers take, by breaking the bladder or coat it is in, and they drink this preffing it forth gently. For it is very whollome and feafonable when the fountains are troubled, as it falls out often in great snowes.

CHAP. XLI.

Of Horsteeches.

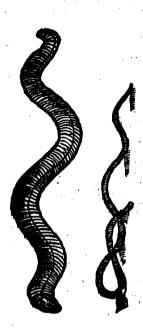

India they are common. Those that are not open behinde, are obvious to every man, and when they are filled with bloud, their skin feems cheequer'd with fibres. Some of them are of divers colours, some green, black, brown, yet not venomous, only the bright bay and Chesnut colours, that are like to pills of trees. They breed chiefly in standing pools, where Cattel are wont to be watred, for from their feet earth and foulnesse are washed, and fall to the bottome, to fay nothing of the sediment of their dung. out of which, that want not vital heat, living Creatures are bred. Once bred, they most greedily thirst after bloud, and therefore they lie in wait in the very entrance of the pools, that they may light upon Horses, Oxen, Elephants, &c. so soon as they come to drink for thirst of cold water. Pliny writes, that they are so troublesome to the Elephant, that the beaft is by their tickling and fucking in his fnout, almost mad, which doth manifestly shew the wonderful power of Infects: For what is there greater then an Elephant? and what is there more contemptible than a Horsleech? Yet the greatnesse and wit of the Elephant must give way and yeeld to this Worm. They feed most on bloud of beasts, and watry bloudy matter; yet when they want fustenance, they fill themselves with the filth that riseth from the water. Pliny faith they vanish in the Spring, 1. 9. c. 51. but we see that season to be most fit for the breeding of them. And indeed I can see no reason, that when they have overcome the Winters cold, they should not be able to stand out the Springs mildeness. And this we all know, that Horsleeches will die in the Winter, unlesse they be carefully preserved in warm water, and fed with bloud very plentifully. If any man swallow a Horsleech, some perswade us to drink pickle, others inow-water : But Afelepiades bids us first to wash the mouth, and to put a soft Sponge wet in cold water into the mouth, that the Horsleech Rick-

ing to the Sponge may be drawn forth. After this he prescribes the juice of Iuck-weed, and to cover the neck with cooling plaisters. But Apollonium, whose surname was Mum, gave the sharpest Vinegar with pickle to drink; but those that gave snow, did first warm it, and used it being dissolved, and they did use meat and drink at fit times to make the belly soluble, that they might drive forth the Horsleech, for they report that so they will oft-times come forth with the excrements. Gal. 1. 2 de Amidoiu. In the dayes of Pliny, wicked men did privily give Horsleeches to their enemies to do them mischief; but Rue with Vinegar, or only Butter, (as against all venoms that did exulcerate) were a present remedy, 11b. 20. c. 13. and 11b. 28. c. 10.

Their ule in phylick is manifold. For lome (Iufe Galens words, lib. de different. fanguinu detrabendi modis, Tract. 10.) take Horsleeches and put them up, and they use them diversly : For when they are made tame they are eafily put upon the skin; but those that are taken must be kept one day, and must be fed with a little bloud; and so it will be that what soever venome they have in them, they will foon cast forth. But when we have need to use them, that part to which you will apply your Leeches must be first rubbed with Nitre, and must be anounted, and scratched with your fingers, that by this means they may fasten the more greedily; but you must cast them into warm water that is contained in a large and a clean veffel, then you must lay hold of them with a Sponge, you must clean e them with your hand from all filth and dirt, and so they will be fit to be applyed. And when you have for them on, left that part they fick to should grow fold, you mult powr on warm, by But, it they be to be applyed to your handt or eet, you must throst them lite the warm water that the Leeches are cast into. And if the will not hold fait, you mult cut off their fails with a pair of Cizzers; for when the bloud to fine forth they will not leave off fucking their you formkle fait or affect upon their mouth. When they are sallen off, that wither ous quality, they are to leave belinde mult be drawn forth with a Curring glaffe; and if that may not be done, you must use a Sponge to foment the place. And if yet glasse, and it that may not be done, you mult use a Sponge to soment the place. And it yet any bloudy drops run forth, apply meal and Cummin, and then binds on some Woods we with a little Oyl. But it yet the bloud will not stop, lay on, a linnen clow ever in Vinegar, or burnt glasse, or a Sponge first put into liquid pitch, and afterwards burnt. And this also you mult observe, that Leeches draw that bloud that is next the stell, and not that which is contained in the Centre of the body. Men use them commonly in stead of Cupping glasses. Mark also that you must take them off when they have crawn half the bloud. And you must beward that, the bloud run not forth so song; untill it be sufficient: For the partic self will grow cold; both by reason of the Leeches that are naturally cold, and because of the air that compassed in the song selfers. But Odrada bids us not to anoynt the place with Nitre, but with milk, that they may safely the songer and withall to high the leech close that strayers and withall to high the leech close that strayers are the second fallen the fooner; and withall to pinch the Leech glose, that striving for revenge he may open the vein, lib. 7. de ref. var. c. 28. What help they were to Dionysius the Tyrant of Heracless the vein, lib: 7. de rer. var. c. 28. What help they were to Dionysius the Tyrant of Heracleis we may read in Histories, who representing rather a beast than a man, locked died with a mighty great paunch, had been eaten by the Worms long before, unlesse Horsleeches had been applyed to both his sides, and drawn forth daily some quantity of the humouits he was charged with. It were too tedious to reckon up all the melancholique and mad people, that have been cured by applying Leeches to the Hemorrods in their, sundaments. Yet I may het over-pass the Noble Richard Cavends in the world linke by the fathers side of that samous Navigator through the world Thomas Cavends in which was perfectly cured of his Gowt that had held him many years, only by applying Horsleeches to the Emrods in Ano every moneth, so that now to the great wonder of all the Gowt, he walks alone without any help, and being soundand void of all pain, he sives an old man. Allo Horsleeches set upon the sundament, will convended fully pluck back the humours that run from the whole body to the sounce that they will propoderfully pluck back the humours that run from the whole body to the sounce that they will propoderfully pluck back the humours that run from the whole body to the joynts, that they will presently ea che pains like a Charm. This I proved at Lions upon an excellent Musitian, one Rosolus; who for the great pains he endured, and by continual waking, fell into a burning Feaver, with raving, in the Dog-dayes, at which time Hipportales saith it is dangerous to purge. It is in this case such a remedy, that it is to be preferr'd before all others, for they draw from the whole body without any trouble or losse of a mans forces. Jac. Aubert. Exercit. 50. progymnasm, Fernel. Abdit. Godfridus a Cenami, a Venetian, a famous man, and my very great friend, for just and lawfull causes, who told me that he faw one who had the joynt Gowt, who lived many years free of all his pains, only by applying Leeches to the part that was in pain. Math. de Grad. and Savanrola, Jacob Dournes, Apolog. lib. c. 3. perswade the same remedy. Also Gilbertus Anglicus reports, that the Lowsie disease generally is to be cured with the ashes of Horsleeches boyled with Storax: For they are not only usefull for men whilest they are alive, but when they are dead and burnt to aftes. Pliny reports, lib. 32. c. 7. that Horsleeches will black ones hair, if they be corrupted in black wine for fixty dayes: Others bid us take one fextarius of Leeches, and let them lie to corrupt in two sextarii of Vinegar, in a leaden vessel for so many dayes, and then to anount with them in the Sun. Somatim relates, that this medicament is of fo great force, that uleffe they hold Oyl in their mouths that die the hair, it will also black their teeth. Meges writes, that live Frogs putrefied in Vinegar, will take off the hair, but the after of Leeches anounted with Vinegar will doe the same."

Of Water-worms.

In waters both falt and fresh, great and small Worms will breed of putresaction, especially in Summer, very like Earth-worms, but they want that knot or chain about their necks: Also they are by far more sharp and lean; oft-times they lie in the sand, and they east up earth out of their holes, as Earth-worms do In sweet waters that are standing, and not deep, there is found a kinde of Worms of a sulf red, that resemble in shape the Teredo without seet, but that they have greater heads. Their tail is forked, whereby they stay themselves, till listing up their heads they may finde a place to saften the rest of their body, and so they creep upon the mud and stones, and so they move in a brandishing manner crookedly. In Summer, when it is clear weather and hot, they come forth together in great numbers, but if the mud move never so little they presently withdraw themselves. The English call them Summer-warm, either because they are seen only in Summer, or they die in Winter. In the Mattertanean Sea there is a round Worm found as great as a great Snake, and of the same colour, but it hath neither head nor tayl, as Weekerus observes. Sometimes it is twenty foot long. What may be the use or neature of these I have not yet observed. But I hope that on there will discover that light that shall hew us both. Yet this is certain, that those Worms serve for baits to catch Fish, specially those small red ones, and Fisher-men diligently seek after them for that purpose. We call shem Water-worms, because as Earth-worms will not live long, in water, so Waster-worms put upon dry land soon die, they wanting Air, and these for want of water.
